ABOUT CHINCH BUGS

Chinch bugs are one of the most troublesome and damaging pests of ornamental turf. They are active throughout the warm season of the year. Chinch bugs attack the turf at or near ground level, sucking sap and causing the grass to wilt, turn brown and die. They spread rapidly and cause the large sections of affected turf to turn brown and dry as if attacked by disease or drought.

The adult chinch bug is not difficult to find. In areas where damage seems to be taking place, take a metal can with both ends removed, and insert one end several inches into the ground. Fill the can with water. In about five minutes any chinch bugs present will float to the surface of the water. (Don't look for chinch bugs in areas where the turf is completely dead, as they are not living there.) These small insects have a strong, vile odor when crushed.

SPREADERS		Actual Rate	Tested Rate
