Poasi herbicide

Active ingredient:	
Sethoxydim: 2-[1-(ethoxyimino)butyl]-5-[2-(ethylthio)propyl]-3-hydro	эхγ-2-
cyclohexen-1-one	18.0%
lnert Ingredients:	82.0%
Total	
Equivalent to 1.5 pounds of sethoxydim per gallon	

EPA Reg. No. 7969-58 EPA Est. No. 34313-TX-01

KEEP OUT OF REACH OF CHILDREN. WARNING/AVISO

Si usted no entiende la etiqueta, busque a alguien para que se la explique a usted en detalle. (If you do not understand the label, find someone to explain it to you in detail.)

See the attached booklet for complete **Precautionary Statements**, **Statement of Practical Treatment**, **Directions For Use**, and **Conditions of Sale and Warranty**.

Net contents:

ACCEPTED

SEP 2 4 1999

Under the Federal Insecticide, Fundicide, and Rodenticide Act, as amended, for the pesticide registered under No 7969-58

Precautionary Statements

Hazard to Humans and Domestic Animals WARNING. Causes substantial but temporary eye injury. Do not get into eyes or on clothing. Harmful if swallowed.

Statement of Practical Treatment

If in eyes: Immediately wash eyes with running water for 15 minutes. If irritation develops, consult a physician.

If on skin: Wash affected areas with soap and water. If irritation develops, consult a physician.

If swallowed: Do not induce vomiting. Dilute with water and get immediate medical attention. Never give fluids or induce vomiting if the victim is unconscious or having convulsions.

If inhaled: Move to fresh air. Aid in breathing if necessary, and get immediate medical attention.

Personal Protective Equipment (PPE)

Some materials that are chemically resistant to this product are listed below. For more options, refer to tegory **G** on an EPA chemical resistance category lection chart.

Applicators and other handlers must wear:

- · Coveralls over short-sleeved shirt and short pants
- Chemical-resistant gloves, such as barrier laminate or viton ≥14 mils
- · Chemical-resistant footwear plus socks
- Protective eyewear
- Chemical-resistant headgear for overhead exposure
- Chemical-resistant apron when cleaning equipment, mixing, and loading

Discard clothing and other absorbent materials that have been drenched or heavily contaminated with this product's concentrate. Do not re-use them. Follow manufacturer's instructions for cleaning/maintaining PPE. If no such instructions for washables, use detergent and hot water. Keep and wash PPE separately from other laundry.

Ingineering Controls Statement

hen handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides [40 CFR 170.240(d)(4-6)], the handler PPE requirements may be reduced or modified as specified in the WPS.

User Safety Recommendations

Users should:

- Wash hands before eating, drinking, chewing qum, using tobacco, or using the toilet.
- Remove clothing immediately if pesticide gets inside. Then wash thoroughly and put on clean clothing.
- Remove PPE immediately after handling this product. Wash the outside of gloves before removing. As soon as possible, wash thoroughly and change into clean clothing.

Environmental Hazards

This product is toxic to aquatic organisms. For terrestrial uses, do not apply directly to water or to areas where surface water is present or to intertidal areas below the mean high water mark. Do not contaminate water when disposing of equipment washwaters.

Endangered Species Concerns

The use of any pesticide in a manner that may kill or otherwise harm an endangered species or adversely modify their habitat is a violation of federal law.

Directions For Use

It is a violation of federal law to use this product in a manner inconsistent with its labeling. Do not apply this product in a way that will contact workers or other persons, either directly or through drift. Only protected handlers may be in the area during application. For any requirements specific to your state or tribe, consult the agency responsible for pesticide regulation.

Unless otherwise stated in supplemental labeling, all applicable directions, restrictions and precautions are to be followed. This labeling must be in the user's

possession during application.

Agricultural Use Requirements

Use this product only in accordance with its labeling and with the Worker Protection Standard, 40 CFR part 170. This standard contains requirements for the protection of agricultural workers on farms, forests, nurseries, and greenhouses, and handlers of agricultural pesticides. It contains requirements for training, decontamination, notification, and emergency assistance. It also contains specific instructions and exceptions pertaining to the statements on this label about personal protective equipment (PPE), and restricted-entry interval. The requirements in this box only apply to uses of this product that are covered by the Worker Protection Standard.

Do not enter or allow worker entry into treated areas during the restricted entry interval (REI) of **12 hours.** PPE required for early entry to treated areas that is permitted under the Worker Protection Standard and that involves contact with anything that has been treated, such as plants, soil, or water, is:

- · Coveralls over short-sleeved shirt and short pants
- Chemical-resistant gloves such as barrier laminate, nitrile rubber ≥ 14 mils, neoprene rubber ≥ 14 mils, or viton ≥ 14 mils
- · Chemical-resistant footwear plus socks
- Protective eyewear
- Chemical-resistant headgear for overhead exposure

Storage and Disposal

Do not contaminate water, food, or feed by storage or disposal.

Pesticide Storage: Do not store below 32° F or above 100° F. Store in a dry place away from heat or open flame. Avoid contamination of feed or foodstuffs.

Pesticide Disposal: Pesticide wastes are toxic. Wastes resulting from this product may be disposed of on site or at an approved waste disposal facility. Improper disposal of excess pesticide, spray mix, or rinsate is a violation of federal law. If these wastes cannot be disposed of according to label instructions, contact the state agency responsible for pesticide regulation or the Hazardous Waste representative at the nearest EPA Regional Office for guidance.

Container Disposal:

Plastic Containers: Triple rinse (or equivalent). Then offer for recycling or reconditioning, or puncture and dispose of in a sanitary landfill, or incineration, or if allowed by state and local authorities, by burning. If burned, stay out of smoke.

Bulk/Mini-bulk Containers:

Refillable/reusable containers should be returned to the point of purchase for cleaning and refilling.

In Case of Emergency

In case of large-scale spillage regarding this product, call:

CHEMTREC 800-424-9300 BASF Corporation

800-832-HELP In case of medical emergency regarding this product, call:

Your local doctor for immediate treatment.

Your local poison control center (hospital).

BASF Corporation (800-832-HELP).

Steps to be taken in case material is released or spilled:

Wear the personal protective equipment specified on this label. Recover the material for re-use according to label whenever possible. Cover the liquid with an absorbent material (such as pet litter). Sweep up and place in an appropriate container for disposal. Remove and wash clothing and personal protective equipment prior to re-use. Keep the spill out of all sewers and open bodies of water.

I. General Information

Poast' herbicide is a selective, broad spectrum, postemergence herbicide for control of annual and perennial grass weeds. Poast does not control sedges or broadleaf weeds. Essentially, all grass crops, such as sorghum, corn, small grains, and rice, as well as ornamental grasses, such as turf, are susceptible to Poast.

Mode of Action

Poast rapidly enters the target weed through its foliage and translocates throughout the plant. The effects range from slowing or stopping growth (generally within 2 days), to foliage reddening and leaf tip burn. Subsequently, foliage burnback may occur. These symptoms will generally be observed within 3 weeks depending on environmental conditions.

Crop Tolerance

All labeled crops are tolerant to **Poast** at all stages of growth.

Herbicide Resistance

Repeated use of **Poast** (or similar postemergence grass herbicides with the same mode of action) may lead to the selection of naturally occurring biotypes with resistance to these products. If poor performance cannot be attributed to adverse weather conditions or improper application methods, a resistant biotype may be present. Consult your local representative or agricultural advisor for assistance.

Irrigation

In irrigated areas, it may be necessary to irrigate before treatment to ensure active weed growth.

Cultivation

Do not cultivate within 5 days before or 7 days after

applying Poast. Cultivating 7 days or later after treatment may help provide season-long control.

Cleaning Spray Equipment

Clean spray equipment thoroughly using a strong detergent or commercial sprayer cleaner according to the manufacturer's directions before and after applying this product.

II. Application Instructions

Applications can be made to actively growing weeds as aerial, broadcast, band, or spot spray applications at the rates and growth stages listed in Tables 1, 2 and 3, unless instructed differently in section VI. Crop-Specific Information. The most effective control will result from making postemergence applications of **Poast** early, when weeds are small. Delaying application permits weeds to exceed the maximum size stated and may prevent adequate control.

Apply **Poast** to the foliage of grasses uniformity and completely because large leaf canopies shelter smaller weeds and can prevent adequate spray coverage. Do not spray to the point of runoff.

Aerial Application Methods and Equipment

Spray Drift Management

Avoiding spray drift at the application site is the responsibility of the applicator. The interaction of many equipment-and-weather-related factors determine the potential for spray drift. The applicator and the grower are responsible for considering all these factors when making decisions. The following drift management requirements must be followed to avoid off-target drift movement from aerial applications to agricultural field crops. These requirements do not apply to forestry applications, public health uses or to applications using dry formulations.

1 The distance of the outer most nozzles on the boom must not exceed 3/4 the length of the

wingspan or rotor.

2 Nozzles must always point backward parallel with the air stream and never be pointed downward more than 45 degrees. Where states have more stringent regulations, they should be observed.

The applicator should be familiar with and take into account the information covered in the Aerial Drift Reduction Advisory Information.

Importance of Droplet Size

The most effective way to reduce drift potential is to apply large droplets. The best drift management strategy is to apply the largest droplets that provide sufficient coverage and control. Applying larger droplets reduces drift potential, but will not prevent drift if applications are made improperly, or under unfavorable environmental conditions (see Wind, Temperature and Humidity, and Temperature Inversion section of this label).

Controlling Droplet Size

Volume - Use high flow rate nozzles to apply the highest practical spay volume. Nozzles with higher rated flows produce larger droplets. Use a minimum of 5 gallons of water per acre. Increase water volume to at least 10 gallons of water per acre if grass foliage or crop canopy is dense.

Table 1. Standard Application Rates and Timing — Annual Grasses
All application rate and timing recommendations are based on growing region. Therefore, refer to the maps below and descriptions below to ensure application accuracy. Follow the Application Rate and Timing tables for your region only. Refer to Table 7 for the maximum allowable use rates for specific crop and use sites.

ļ——·	<u> </u>		1	

Add nitrogen to the crop oil concentrate to improve grass control on indicated species.

Apply Poast* herbicide before tillering.

Poast is not recommended for use on red sprangletop in California, Arizona, or western New Mexico.

Regional Descriptions

West & High and Rolling Plains: An area of the Western United States, including Western Texas, Oklahoma and Kansas; west of a line running north from Del Rio to Gainesville, Texas, and extending along interstate 35 to the Oklahoma-Kansas border, then west along border to Highway 83 and then north to the Kansas-Nebraska border, west to Colorado, all of Colorado to the Continental Divide, then West of the Continental Divide North to the U.S.-Canada border.

Midwest, South, and Northeast: all other regions not listed above.

In the West Region, volunteer cereals that emerge from late spring through early summer (May through July) may be partially or incompletely controlled because of unfavorable conditions at application time.

Table 2. Standard Application Rates and Timing — Perennial Grasses¹
All application rate and timing recommendations are based on growing region. Therefore, refer to the maps below and descriptions in Table 1 to ensure application accuracy. Follow the Application Rate and Timing tables for your region only. Refer to Table 7 for the maximum allowable use rates for specific crop and use sites.

Perennial Grass	Midwand	vest, South, Northeast		est & High and Rolling Plains
Standard Initial Application	Maximum Height	Rate Per Acre (pints)	Maximum Height	Rate Per Acre (pints)
Bermudagrass Johnsongrass (Rhizome) Johnsongrass (No-Till) Muhly, Wirestem Quackgrass' Ryegrass, Perennial	6" stolon 25" 20" 6" 8" 8"	1.5 1.5 1.5 1.25 1.5 1.5	6" stolon 10" — — 8" 8"	2.0²-2.5 1.5²-2.5 ————————————————————————————————————
Sequential Application	Maximum Height	Rate Per Acre (pints)	Maximum Height	Rate Per Acre (pints)
Bermudagrass Johnsongrass (Rhizome) Johnsongrass (No-Till) Muhly, Wirestem Quackgrass' Ryegrass, Perennial	4" stoion 12" 12" 6" 8" 8"	1.0 1.0 1.0 1.25 1.0 1.5	4" stolon 8" — — 8" 8"	1,5° 1.0°-1.5 — — 1,5 1.5

Add nitrogen to the crop oil concentrate to improve grass control on indicated species. Cultivate 7-14 days after an initial or sequential application to aid control.

Use 2.5 pints per acre for the following forage crops: alfalfa, clover, birdsfoot trefoil, sainfoin.

Annual Grass				
	Special Early Maximum Height	Early Rate Per Acre (Pints)	Rescue Maximum Height	Rescue Rate Per Acre (Pints)
Barnyardgrass Crabgrass, Large³ , Smooth³ Foxtail, Giant² , Green² , Yellow² Goosegrass Johnsongrass (seedling) Millet, Wild Proso Panicum, Fall , Texas Signalgrass, Broadleaf Volunteer Corn³	4" 	0.75' 0.75 0.75 0.75 0.75 0.50 0.75 0.75 0.75 0.75	12" 8" 8" 16" 16" 16" 24" 12" 12"	1.5 1.5 1.5 1.5 1.5 1.5 1.5 1.0 1.5 1.0

In the following states use 1.0 pint: AL, AR, FL, GA, LA, MS, NC, SC, TN, TX, and VA.
For flax, use 0.5 pint per acre when foxtails are less than 1.5" high. When using the special early rate, the foxtail species should not have started to tiller.
Add nitrogen to the crop oil concentrate to improve grass control on indicated species.

Pressure - Use the lower spray pressures recommended for the nozzle. Higher pressure reduces droplet size and does not improve canopy protection. When higher flow rates are needed, use higher flow rate nozzles instead of increasing pressure. Use up to 40 psi.

Number of nozzles - Use the minimum number of

nozzles that provide uniform coverage.

Nozzle Orientation - Orienting nozzles so that the spray is released backward, parallel to the airstream, will produce larger droplets than other orientations. Significant deflection from the horizontal will reduce droplet size and increase drift potential.

Nozzle Type - Use a nozzle type that is designed for the intended application. With most nozzle types, narrower spray angles produce larger droplets. Consider using low-drift nozzles. Solid stream nozzles oriented straight back produce larger droplets than other nozzle types. Use only diaphragm-type nozzles that produce fan spray patterns.

Boom Length - For some use patterns, reducing the effective boom length to less than 3/4 of the wingspan or rotor length may further reduce drift without

reducing swath width.

plication - Applications should not be made at a neight greater than 10 feet above the top of the largest plants unless a greater height is required for aircraft safety. Making applications at the lowest height that is safe reduces exposure of droplets to evaporation and wind.

Swath Adjustment

When applications are made with a cross-wind, the swath will be displaced downwind. Therefore, on the up and downwind edges of the field, the applicator must compensate for this displacement by adjusting the path of the aircraft upwind. Swath adjustment distance should increase, with increasing drift potential (higher wind, smaller drops, etc.).

Wind

Drift potential is lowest between wind speeds of 2-10 mph. However, many factors, including droplet size and equipment type, determine drift potential at any given speed. Application should be avoided below 2

terrain can influence wind patterns. Every applicator should be familiar with local wind patterns and how they affect drift.

Temperature and Humidity

When making applications in low relative humidity, set equipment up to produce larger droplets to compensate for evaporation. Droplet evaporation is most severe when conditions are both hot and dry.

Temperature Inversions

Applications should not occur during a temperature inversion, because drift potential is high. Temperature inversions restrict vertical air mixing, which causes small suspended droplets to remain in a concentrated cloud. This cloud can move in unpredictable directions due to the light variable winds common during inversions. Temperature inversions are characterized

by increasing temperatures with altitude and are common on nights with limited cloud cover and light to no wind. They begin to form as the sun set and often continue into the morning. Their presence can be indicated by ground fog; however, if fog is not present, inversions can also be identified by the movement of smoke from a ground source or an aircraft smoke generator. Smoke that layers and moves literally in a connected cloud (under low wind conditions) indicates an inversion, while smoke that moves upwards and rapidly dissipates indicates good vertical air mixing.

Sensitive Areas

The pesticide should only be applied when the potential for drift to adjacent sensitive areas (e.g., residential areas, bodies of water, known habitat for threatened or endangered species, nontarget crops) is minimal (e.g. when wind is blowing away from the sensitive areas). Do not apply **Poast** by air if sensitive species are within 200 feet downwind.

Ground Application Methods and Equipment (Broadcast)

Do not apply when conditions favor drift from target area or when windspeed is greater than 10 mph. **Water Volume:** Use 5-20 gallons of spray solution. In

the West and in the High and Rolling Plains Region, (see regional descriptions in **Tables 1**), do not use less than 10 gallons of spray solution per acre. **Spray Pressure:** Use 40-60 psi (measured at the

boom, not at the pump or in the line). When crop and weed foliage are dense, use a maximum of 20 gallons

of water and 60 psi.

Application Equipment: Use standard high-pressure pesticide flat fan or hollow cone nozzles spaced up to 20" apart. Do not use flood, whirl chamber, or controlled droplet applicator (CDA) nozzles as erratic coverage can cause inconsistent weed control. When tall weeds such as volunteer corn are to be controlled, the boom should be high enough to cover the entire plant. Refer to the nozzle manufacturer's directions for recommended height. When a crop such as cotton is 24" or taller and the grasses are below the crop canopy, use drop nozzles to ensure good coverage of the grass species.

Do not use selective application equipment such as recirculating sprayers or wiper applicators.

Ground Application (Banding)

Poast* herbicide may be applied by banding to control annual grasses. Banding is not recommended for perepolal grasses.

for perennial grasses.

Follow **Ground Application (Broadcast)** instructions for band applications. When applying **Poast** by banding, determine the amount of herbicide and water volume needed using the following formula:

Bandwidth in inches X Broadcast rate per acre Banding herbicide rate per acre

Bandwidth in inches X Broadcast Solume per acre Banding water volume per acre

70+18

Spot or Small Area Application

Do not make spot treatments in addition to broadcast or band treatments. When using knapsack sprayers or high-volume spray equipment with hand guns or other suitable nozzle arrangements, prepare a 1-1.5% solution of **Poast** in water unless otherwise specified under specific crops. Use a concentration of 0.5% for **Dash* HC** and **Sundance* HC** spray adjuvants, or 1% for oil concentrate. Prepare the desired volume of spray solution by mixing the amount of **Poast** and the amount of **Dash HC**, **Sundance HC** or oil concentrate in water according to **Tables 5** and **6**.

Rescue Treatment for Controlling Selected Annual Grasses

If **Poast** cannot be applied at the recommended time, larger annual grasses may be controlled with a later application by increasing the rate of **Poast** (see **Table 3**). Do not exceed the maximum rate per acre, per season, for specific crops (see **Table 7**).

III. Additives

To achieve consistent weed control, always use one of the following additives: Dash HC, Sundance HC, methylated/modified seed oil, or crop oil concentrates. In addition, urea ammonium nitrate or ammonium sulfate is recommended for use on alfalfa, beans, cotton, flax, peanuts, peas, potatoes, soybeans. Poast Protected™ field corn, sugarbeets, and sunflowers to enhance activity on certain grass species. See Table 4. Additive Rates Per Acre for more information. However, when used in many vegetable crops under the following conditions, Poast plus adjuvants should be used with caution due to potential crop leaf injury: when the temperature exceeds 90 °F and the relative humidity is 60% or greater, or anytime the temperature exceeds 100 °F, regardless of the humidity.

Because most nitrogen solutions are mildly corrosive to galvanized, mild steel, and brass spray equipment, rinse the entire spray system with water soon after use. UAN and AMS are not recommended in the Pacific Northwest and are not registered in California. Consult a BASF representative or local agricultural authority for more information on the use of additives.

Dash HC, Sundance HC, Crop Oil Concentrates, or Methylated Seed Oils

A crop oil concentrate must contain either a petroleum or vegetable oil base and must meet all of the following criteria:

be nonphytotoxic.

contain only EPA-exempt ingredients,

provide good mixing quality in the jar test, and

be successful in local experience.

The exact composition of suitable products will vary; however, vegetable and petroleum oil concentrates should contain emulsifiers to provide good mixing quality.

Highly refined vegetable oils have proven more satisfactory than unrefined vegetable oils. For more information, see Compatability Test for Mix Components. For most crops, Dash' HC or Sundance' HC spray adjuvantsmay be substituted for crop oil concentrate or methylated seed oil; however, for some crops and tank mixes, Dash HC, Sundance HC and MSO are not recommended. (See section VI. Crop-Specific Information for more information.)

Nitrogen Source

 Urea Ammonium Nitrate (UAN): Commonly referred to as 28%, 30%, or 32% nitrogen solution), UAN may be used in addition to Dash HC, Sundance HC, or crop oil concentrate to improve weed control. Do not use brass or aluminum nozzles when spraying UAN.

Table 4. Additive Rates Per Acre

Additive	Ground Application	Aerial Application
AMS Dash HC/Sundance HC Crop Oil Concentrate Methylated Seed Oils/MSO UAN Solution	2.5 pounds 1.0 pints 2.0 pints 1.5 pints 4.0-8.0 pints	2.5 pounds 1.0 pint 2.0 pints 1.5 pints 4.0 pints

See VI. Crop-Specific Information for more details and use restrictions. n/a = not applicable.

 Ammonium Sulfate (AMS): AMS per acre may be substituted for UAN. When liquid AMS is used, 3.0 quarts of 8-8-0 analysis may be substituted for 2.5 pounds of dry AMS. Use high-quality AMS (spray grade) to avoid plugging of nozzles. Other sources of nitrogen are not as effective as those mentioned. If the AMS is added directly to the spray tank, add slowly while agitating. Adding the mix too quickly may clog outlet lines. Be sure the AMS is completely dissolved before adding any other products. BASF does not recommend applying AMS if applied in less than 10 gallons per acre because of potential problems with precipitation in reduced volumes.

UAN and AMS are not registered in California.

IV. General Tank Mixing Information

Tank Mix Partners/Components

The following products, listed with its common name, may be tank mixed with Poast' herbicide according to the specific tank mixing instructions in this label and respective product labels.

Jasagran*/bentazon

- Betamix*/desmedipham+ phenmedipham
- Betanex*/desmedipham ·Blazer*/acifluorfen
- Bronate*/bromoxynil + MCPA
- Buctril*/bromoxynil
- Clarity*/dicambaClassic*/chlorimuron
- Cobra*/lactofen
- Dual*/metolachlor
- Dual II[®]/metolachlor FirstRate*/cloransulam-
- methyl • Flexstar */fomesafen
- ·Frontier*/dimethenamid
- ·Galaxy*/bentazon + acifluorfen
- Guardsman*/atrazine + dimethenamid
 - "Harness"/acetochlor addok* S-12/bentazon +
- Lexone DF/metribuzin
- · Liberty */glufosinate

 Marksman*/atrazine + dicamba

- MCPA
- Pursuit*/imazethapyr

- chlorimuron + thifensulfuron
- Touchdown*/sulfosate
- · UpBeet*/triflusulfuron
- •2,4-D amine
- •2,4-DB
- •2,4-D (LVE)

See section VI. Crop-Specific Information for more details. Read and follow the applicable Restrictions and Limitations and Directions For Use on all products involved in tank mixing. The most restrictive labeling applies to tank mixes

Separate applications should be made if all target weeds are not at the labeled growth stage for

treatment at the same time.

Physical incompatibility, reduced weed control, or crop injury may result from mixing Poast with other pesticides (fungicides, herbicides, insecticides, or miticides), additives, or fertilizers. BASF does not recommend using tank mixes other than those listed on BASF labeling. Local agricultural authorities may be a source of information when using other than BASF recommended tank mixes.

Compatibility Test for Mix Components

Before mixing components, always perform a

compatibility jar test.

For 20 gallons per acre spray volume, use 3.3 cups (800 ml) of water. For other spray volumes, adjust rates accordingly. Only use water from the intended source at the source temperature.

Add components in the sequence indicated in the Mixing Order using 2 teaspoons for each pound or 1 teaspoon for each pint of recommended label rate per acre. Always cap the jar and invert 10 cycles between

component additions.

When the components have all been added to the jar, let the solution stand for 15 minutes. Evaluate the solution for uniformity and stability. The spray solution should not have free oil on the surface, nor fine particles that precipitate to the bottom, nor thick (clabbered) texture. If the spray solution is not compatible, repeat the compatibility test with the addition of a suitable compatibility agent. If the solution is then compatible, use the compatibility agent as directed on its label. If the solution is still incompatible, do not mix the ingredients in the same tank.

Mixing Order

1) Water. Begin by agitating a thoroughly clean sprayer tank three-quarters full of clean water.

2) Agitation. Maintain constant agitation throughout mixing and application.

3) Products in PVA bags. Place any product contained in water-soluble PVA bags into the mixing tank. Wait until all water-soluble PVA bags have fully dissolved and the product is evenly mixed in the spray tank before continuing.

4) Water-dispersible products (such as dry flowables, wettable powders, suspension concentrates, or suspo-emulsions). If an inductor is used, rinse it thoroughly after the component has been added.

5) Water-soluble products. If an inductor is used, rinse it thoroughly after the component has been

added

6) Emulsifiable concentrates (such as Poast or oil concentrate when applicable). If an inductor is used, rinse it thoroughly after the component has been added.

7) Water-soluble additives (such as AMS or UAN when applicable). If an inductor is used, rinse it thoroughly after the component has been added.

8) Remaining quantity of water. Maintain constant agitation during application.

V. General Restrictions and Limitations - All Crops

- Maximum seasonal use rate: See Table 7 for crop-specific maximum seasonal use rates.
- Preharvest Interval: See Table 7 for crop-specific preharvest intervals.
- · Restricted Entry Interval (REI): 12 hours
- Avoid all direct or indirect contact with any desired grass crop unless otherwise recommended on the Poast* herbicide label.
- Stress: Do not apply to grasses or crops under stress due to lack of moisture, hail damage, flooding, herbicide injury, mechanical injury, or widely fluctuating temperatures, as unsatisfactory control may result. In irrigated areas, it may be necessary to irrigate before application to insure active weed growth.
- Do not apply to crops that show **injury** (leaf phytotoxicity or plant stunting) produced by any other prior herbicide applications, because this injury may be enhanced or prolonged.
- Do not apply as a **preplant** or **pre-emergence treatment** before planting grass crops, such as corn, millet, or sorghum, unless otherwise specified on supplemental labeling.
- Do not use UAN or AMS in California.
- Do not use selective application equipment such as recirculating sprayers, wiper applicators, or shielded applicators.
- Rainfast Period: Poast is rainfast 1 hour after application.
- Do not apply through any type of irrigation equipment.

VI. Crop-Specific Information

Crops Grown For Seed

Poast* herbicide is recommended for use on all crops on this label when they are grown for seed production. Use the Poast rates given for each food crop listed in other sections on this label. Slight modifications in application methods may be required for certain seed crops due to crop canopy or different cultural methods from the corresponding food crop.

Field Crops

Always add 1.0 pint of **Dash* HC** or **Sundance* HC** spray adjuvant, or 2 pints of oil concentrate per acre. Add 4.0-8.0 pints of UAN or 2.5 pounds of AMS to control crabgrass, volunteer corn and all volunteer cereals. UAN and AMS are not registered in California.

Beans, Dry

Poast may be applied in tank mixes with other herbicides registered for use in dry beans, such as:

asagran

•Frontier*

Beans, Succulent

Air application not registered in California.

Canola/Crambe/Rapeseed

Not registered in California. Processed meal may be fed.

Corn

Only Poast Protected™ field corn hybrids are tolerant to Poast applications. Severe crop injury will occur to corn hybrids not designated as Poast Protected corn.

Mot for use in California.

er-the-top applications of **Poast** in **Poast rotected field corn** may be made until the onset of pollen shed provided the appropriate preharvest intervals are met. Do not apply **Poast** after pollination occurs

Poast may be applied in tank mixes with other herbicides registered for use in corn, such as:

•Atrazine •Basagran• •Dual• & Dual II• •Frontier• •Guardsman• ·Harness*
·Laddok* S-12
·Surpass*
·2,4-D (LVE)

Cotton

Processed meal may be fed to animals. **Poast** may be applied in tank mixes with other herbicides registered for use in cotton (including herbicides registered for use in cotton tolerant ot glyphosate and bromoxynil); some of those products are:

•Buctril*
•Roundup Ultra*

•Staple

For best grass control, apply **Poast** 3 days prior to **Staple**.

Flax

Not registered in California
Processed meal may be fed to animals.

Poast may be applied in tank mixes with

Poast may be applied in tank mixes with other herbicides registered for use in flax, such as:

·Buctril'
·MCPA

·Bronate*

Buctril*, MCPA or **Bronate*** herbicides applied with **Poast** may cause leaf burn, retarded growth, and delayed maturity of the crop.

Tank Mixing Restrictions (partial list)

Do not delay spraying broadleaf weeds even though grassy weeds are not in the correct stage for treatment.

Do not add AMS or UAN solution to a tank mix of **Poast** + **Buctril** or MCPA or **Bronate**.

Lentil

Not registered in California.

Mint

Poast may be applied in tank mixes with other herbicides registered for use in mint, such as:

·Basagran*

·Buctril*

Peanut

Processed meal may be fed to animals. **Poast** may be applied in tank mixes with other herbicides registered for use in peanuts, such as:

·Basagran' ·Blazer' ·Storm* ·2,4-DB

Soybean

In California, the maximum rate per acre per application is 2.0 pints.

Only processed meal from seed or hay may be fed to animals.

Poast* herbicide may be applied in tank mixes with other herbicides registered for use in soybeans (including herbicides registered for use in soybeans tolerant to glyphosate, glufosinate and imidazolinone); some of those products are:

·Basagran*	•Pursuit* W DG
·Basagran* ·Blazer*	•Raptor [™]
·Classic*	•Reflex*
·Cobra*	◆Reliance* STS
·FirstRate*	•Resource*
•Flexstar*	•Roundp Ultra*
•Frontier*	•Stellar*
•Galaxy*	•Storm*
·Liberty*	Synchrony* STS
•Pursuit*	Synchrony* STSTouchdown*
•Pursuit* DG	+2,4-D (LVE)*
Pursuit' W	-, · - (- · -,
1	

[&]quot;For use as preplant burndown only.

Tank Mix Specific Restrictions Tank mixes of Poast with Basagran* + Blazer*, Galaxy* or Storm* herbicide is not for use in

California.

Do not use MSO with any tank mix combination except with Basagran, Pursuit* or Raptor* herbicides.

Sugar Beets

Processed pulp and molasses may be fed to animals. Poast may be applied in tank mixes with other herbicides registered for use in sugar beets, such as:

·Betamix Stinger' UpBeet* Betanex*

Poast may be tank mixed with other postemergence herbicides that are registered for use on sugar beet varieties tolerant to those herbicides.

Tank Mixing Restrictions

Not for use in California.

The use of UAN solution or AMS with a Poast* + Betamix*/Betanex* herbicides tank mix is not recommended.

Do not use Poast + Betamix/Betanex if grasses to be controlled include rhizome Johnsongrass, quackgrass, Bermudagrass, wirestern muhly, volunteer corn, shattercane, red rice, or itchgrass.

Sunflower

Commercially released varieties of sunflower are tolerant to Poast at all stages of growth; however, leaf speckling has been occasionally observed on sunflowers with no corresponding reduction in vigor or growth. Poast is not recommended for use on sunflower inbred lines grown for seed because crop safety of these lines has not been adequately established.

Processed meal and soapstock may be fed to animals.

Tobacco

Not registered in California. Apply **Poast only** at the seedbed stage of growth.

Forage Crops

Alfalfa, Birdsfoot Trefoil, Clover, Sainfoin

Poast may be applied to seedling or established alfalfa and clover grown for hay, silage, green chop, direct grazing, or for seed.

Mowing: The best control of annual grasses can be achieved by applying Poast before grass weeds are mowed. Once a grass is mowed it becomes tougher to control, as much of the leaf surface may be removed, putting the grass under stress. In areas without a killing frost, some annuals can over-winter after having been mowed a number of times. These grasses can form large crowns and contain many viable buds. A large crown, even if it is an annual grass, may require repeated applications of Poast for partial or complete control.

Tank Mixing in Alfalfa, Birdsfoot Trefoil & Sainfoin Only Poast may be applied in tank mixes with other herbicides registered for use in these crops, such as: •2,4-DB

<u>Tank Mix Specific Restrictions</u>
Do not add UAN solution or AMS to a tank mix of Poast + 2,4-DB.

Do not use Poast + 2,4-DB in the High and Rolling Plains of Texas, Western Oklahoma, Western Kansas, and Eastern New Mexico.

IRRIGATED ALFALFA, CLOVER, BIRDSFOOT TREFOIL, AND SAINFOIN:

Irrigation practices can be very critical to the successful use of Poast and may be necessary to start grass weeds growing again. Generally, applications 2-4 days after an irrigation are most effective because:

· grasses resume active growth,

grasses have less chance to grow too large,

 by waiting later, the clover or alfalfa begins to canopy and interferes with spray coverage. Irrigation shortly after application (2 days) can be effective, but more consistent grass control is obtained when the irrigation is made before the application.

Annual Grass Control

Apply Poast at the grass sizes and rates indicated in Tables 1 and 3. If a grass has been cut, apply Poast after the regrowth reaches the minimum height (so there will be enough leaf area for absorption) and before it exceeds the maximum height indicated. Apply before the clover or alfalfa canopies cover the grasses and interfere with the spray coverage. Also, applications after a clover or alfalfa cutting may need to be timed to follow an irrigation or rainfall which will allow the grasses to regrow to a treatable size. Some annual grasses are spring- and summergerminating plants, while others are fall-germinating plants, and the time they are actively growing and most susceptible to Poast may vary from area to area. Also, some annuals germinate over a long time,

and because control of small grasses is desired, applications after each weed flush may be needed. As a general guideline, spray spring- and summergerminating grasses as early in the season as possible. The optimum application timing may occur very early in the spring after initial green-up. Spray fall-germinating weeds in the fall soon after they begin growing but before any killing frosts. Late fall applications may be less effective due to environmental changes, such as frosts or the onset of flowering.

Perennial Grass Control

Poast effectively controls or suppresses perennial grasses, such as Bermudagrass, johnsongrass, quackgrass, wirestem muhly, and perennial ryegrass. See Table 2. However, their growth characteristics are such that they are more difficult to control than annual grasses, especially in a perennial crop such as established alfalfa or clover. A program of repeated applications is usually necessary for best results. The most economical way of controlling perennial grasses is to do so in the year of stand establishment before rhizomes or stolons become large and difficult kill. The field should be disked before seeding to

broughly fragment rhizomes or stolons. In summer and fall seedings, cool season grasses (quackgrass, wirestem muhly, and perennial ryegrass) can become very competitive under cool fall conditions. Fall applications of **Poast* herbicide** will reduce late season grass growth and limit the ability of grasses to accumulate nutrient reserves in roots and rhizomes.

In established stands, it is important to begin applying in the spring when conditions favor active growth and before storage tissues have increased their nutrient reserves. Additional applications should be made on any grass regrowth in later cuttings.

Interseeded Oats

Oats interseeded with clover, alfalfa, birdsfoot trefoil, and sainfoin may be killed by applying **Poast* herbicide**. Their removal allows the seedling crops to arrow with less competition. This application should be jade before the interseeded oats reaches the boot page or later to be most effective.

Fruit and Nut Crops

Blueberry

Not registered in California.

Caneberries

Aircraft use not registered in California.

Citrus

Pulp and waste may be fed to livestock.

Cranberry

Not registered in California.

Grape

Pomace and raisin waste may be fed to animals.

Pome Fruits

Pressed or processed apple waste may be fed to animals.

Strawberry

Not for use on strawberries in Florida. Not for aircraft application in California.

Tree Nuts

Poast may be used for grass control and suppression in bearing or nonbearing tree nuts. Tree nuts are very tolerant to **Poast** and **Poast** may be applied over the top of small, nonbearing trees or as a directed spray on larger trees.

Do not apply **Poast** with another pesticide whose label cautions against use with oil adjuvants. In almond, only almond hulls may be fed to animals. Tree nuts do not include pistachio.

Nonbearing Fruit and Nut Crops

For nonbearing areas, always add 1.0 quart of oil concentrate per acre.

The nonbearing crops that **Poast** may be applied to are:

Avocado Pistachio
Date Plum
Fig Pomegranate
Olive Prune

To minimize the potential for tree injury, direct the spray away from the leaves as much as possible.

Set Aside Conversation Reserve Land, Fallow Acreage

Broadleaf Cover Crops: The growth of broadleaf cover crops such as alfalfa, clover, lespedeza, trefoils, and vetches will not be affected by **Poast**.

Grass Cover Crops: Most seeded grass crops such as oats, sudangrass, tall fescue, orchardgrass, bromegrasses, ryegrass, or timothy will be injured or killed by Poast, therefore, do not use Poast if injury to these grass cover crops is undesirable. Seeded grass cover crops may be injured or killed.

Restrictions and Limitations (partial list)

Do not harvest or graze cover crops other than alfalfa, clover, birdsfoot trefoil, or sainfoin treated with Poast. Do not plant any other crop to be harvested for 120 days after application, unless **Poast** is registered for use in that crop.

This use is applicable only for the Midwest, South, and Northeast areas or East of the Rocky Mountains

(see maps in Table 1).

For alfalfa cover crops, do not apply **Poast** within 7 days of grazing, feeding, or cutting for (undried) forage, or within 14 days of cutting alfalfa for (dry) hay. For alfalfa cover crops, do not apply more than a total of 6.5 pints of **Poast** per acre in one season.

Poast* herbicide may be applied in tank mixes with other herbicides registered for use in these crops, such as:

·Clarity* ·Marksman* •Roundup Ultra*
•2,4-D

Interseeded Cover Crops

Poast Activity on the Cover Crop

Grass cover crops controlled or suppressed by this use include wheat, oats, and barley, or any grass crop for which **Poast** is labeled. **Poast** will selectively control grass cover crops in seedling nongrass or broadleaf field, forage, or vegetable crops without injury. In addition, **Poast** will control any annual grasses that have emerged since planting. The slowdying grass can provide a protective mulch for the primary crop seedlings for up to 3 weeks after applying **Poast**.

Apply **Poast** to cereals that are 3-4" in height (before tillering). Do not allow cereals to exceed this height as excessive competition and lack of control may occur.

Noncrop Areas

Deciduous Trees, Nonfood Crop Areas, Fallow Land

DECIDUOUS TREES,

NONFOOD CROP AREAS, FALLOW LAND:

Poast may be used in noncrop areas including rightsof-ways, roadsides and other paved areas, along fences and hedgerows, public buildings, recreation areas, industrial sites, storage yards, airports, electric transformer stations, pipeline pumping stations, sewage disposal areas, on potting and top soils, uncultivated agricultural areas, and general indoor or outdoor sites.

Poast is not recommended for use on red sprangletop in California, Arizona or western New Mexico.

Notice to user: Due to variability within species and in application techniques, neither the manufacturer nor the seller has determined whether or not Poast can be safely used on all varieties and species of nonbearing food crops, and other nonfood crops under all conditions. Therefore, determine if Poast* herbicide can be used safely before broad use in the following manner:

On a small test area, apply the recommended rate of **Poast** on nonbearing or nonfood crop species or varieties under the conditions expected to be encountered. Any adverse conditions should be visible within 7 days.

TALL FESCUE GROWTH SUPPRESSION: (Alabama, Georgia, Kentucky, North Carolina, South Carolina, Tennessee, Virginia, and West Virginia only)

Apply **Poast** to actively growing tall fescue after it has 4-6 inches of new growth, before the emergence of seedheads and before conifer bud break. Applications made from July 1 to mid-August may be less effective, especially if day temperatures reach 90 °F. Tall fescue must be 1-year old before the first application of

Poast.

Adequate coverage of the leaf surface is necessary for absorption of this herbicide. Thus, for optimum control, do not mow tall fescue turf for 30 days before or 14 days after applying **Poast**.

Rate: Apply 1.0-1.25 pints of Poast per acre. For greater fescue suppression, up to 2.5 pints of Poast per acre can be used. Because of environmental differences at application and growth differences of tall fescue, control may exceed or fall short of that desired. Begin treating crops with Poast at the minimum recommended rate and adjust rates as local conditions and experience dictate. Additional applications may be made if extended growth suppression is desired.

ORCHARD FLOOR MIDDLES:
Growth Management In Orchard Floor Middles
Poast may be applied in tank mixes with other
herbicides registered for use in these crops, such as:
2,4-D amine

Poast and 2,4-D dimethylamine can be used in a tank mix for growth management in orchard floor middles to reduce the number of mechanical mowings needed during a season. Poast and 2,4-D dimethylamine can be safely applied for growth management in the following cool season grasses and mixtures: Kentucky bluegrass, perennial ryegrass, and tall fescue. Some degree of discoloration of the turf may occur. However, the turf will regrow and green up as effects of the treatment wear off. Make one application per season from the following options:

 Poast and 2,4-D dimethylamine can be applied during the spring or summer when growth management is desired. Do not apply during bloom or within 3 days of a mowing.

 An optimal timing for application is after sod green up in the spring (before any mowing) or 3 days after the initial mowing of the season is made.

 A prebloom treatment is recommended as any broadleaf weeds such as dandelions can be controlled before they hamper fruit pollination.
 This treatment will provide 5-8 weeks of growth management depending on the sod makeup (e.g., grass species, amount of broadleaf weeds present, etc.), environmental conditions and the desired maintenance height of the middles.

See section III. Additives, Mixing Order for details.

Tank Mix Specific Restrictions

Make no more than 1 application of this tank mix per growing season.

Do not apply if rainfall or irrigation is expected within 6 hours after application as growth management effects will probably be unsatisfactory.

Do not apply to a grass sod that is less than 2 years old.

Do not apply to newly established orchards. Trees must be at least 1 year old and in vigorous condition. Do not apply this tank mix within 14 days of harvest of apples and pears.

Do not apply this tank mix to nonbearing stonefruits within one year of harvest.

Not registered for use in California.

Vegetable Crops

Allow a minimum of 14 days between sequential applications.

Always add oil concentrate at 2 pints per acre. However, when the temperature exceeds 90 F and the relative humidity is 60% or greater, or anytime the temperature exceeds 100 °F, regardless of the humidity, **Poast' herbicide** plus adjuvants should be used with caution due to potential leaf injury. Do not use **Dash HC'** nor **Sundance' HC spray adjuvants** or methylated seed oils.

Horseradish

Not for use in California.

Potato and Tomato

In case of heavy infestations of quackgrass, use 2.5 pints of **Poast** per acre followed by 1.5 pints per acre sequentially if needed

Potato and tomato wastes may be fed to animals.

Poast may be applied in tank mixes with other
plicides registered for use in these crops, such as:

Lexone* DF

·Sencor* DF

Tank Mix Specific Restrictions

These tank mixes not applicable to California. Do not apply this tank mix to sweet potato or yams. No tank mixes other than Lexone* DF or Sencor* DF herbicides are to be applied with Poast. Apply only if there have been at least 3 successive days of sunny weather before application or crop injury may occur.

Do not add UAN solution or AMS to a **Poast* herbicide** + **Lexone DF** or **Sencor DF** tank mix.

Do not use this tank mix if grasses to be controlled include rhizome johnsongrass, quackgrass,

Bermudagrass, wirestem muhly, volunteer corn or cereal, shattercane, red rice, or itchgrass.

Apply only to russetted or white-skinned varieties of potato that are not early maturing.

fo not apply this tank mix within 60 days of potato rvest.

Do not treat transplanted tomatoes within 14 days of transplanting. Tomatoes must have recovered from transplant shock and new growth must be evident. Do not treat seeded tomatoes until plants have reached the 5-6 leaf stage.

Sweet Potato

Eastern U.S. includes AL, FL, GA_LA, MS, NC, SC, TN, TX and VA. Western U.S. includes AZ, CA, ID, NV, OR and WA.

Rhubarb

Rhubarb grown only in IL, IN, MI, MN, and WI may be harvested up to **15 day PHI**. Aircraft application not registered.
