BEES AND WASPS:

It is generally advisable to treat wasp and bee nests in the evening when insects are less
active and have returned to the nest. Using hand or power duster or other suitable
means, with extension tubes if necessary, thoroughly dust nest and entrance and
surrounding areas where insects might nest. Nests in wall voids can be located by listening
with your ear against the wall. Drill a hole in the area, blow dust in, and reseal. For
ground wasps dust entrance and surrounding areas. For best results check nests
carefully one or two days after treatment to ensure complete kill, then remove and
destroy nest to prevent emergence of newly-hatched insects. If removal is not feasible,
retreat the nest, if necessary. Do not use this product to treat overhead nests.

BEDBUGS:

Take bed apart. Dust into joints and channels. If hollow, such as square or round
tubing, see that the interior of framework is well dusted. Mattresses should be dusted,
especially tufts, folds, and edges. Picture frame moldings and all cracks and crevices in
the room should be treated.
