**INDUSTRIAL WATER TREATMENT
CHEMICAL CLEANING**

DIRECTIONS FOR USE

Microbiocide No. 5 is used to control algae, bacteria and fungi in recirculating commercial and industrial water cooling towers. Prior to its use, systems must be cleaned to remove algal growth, microbiological slime and other deposits. An initial slug addition of 10.2 to 25.25 fluid ounces of Microbiocide No. 5 per 1000 gallons of water to provide a concentration of 4.8 to 120 parts per million of active ingredient is recommended. Repeat initial dosage until control is evident. Subsequent slug additions of 2.52 to 25.25 fluid ounces per 1000 gallons of water (1.2 to 120 parts per million) of active ingredient should be employed every 2 to 5 days or as needed. The frequency of addition depends upon the relative amount of bleed-off and the severity of the microbiological problem. Slug additions should be made in the sump of water cooling towers.

Do not reuse empty drum. Return to drum reconditioner or destroy by perforating or crushing and burying in a safe place away from water supplies.
