POTATOES: All potatoes are susceptible to late blight. The disease is caused by a fungus that can be spread by wind, rain, or irrigation water. Symptoms include dark, water-soaked lesions on the leaves and stems, and dark, brownish-purple lesions on the tubers. Potatoes should be planted in well-drained soil and watered regularly. Fungicides can be used to prevent late blight, but they are most effective when applied before the disease has spread.

SUGAR BEETS: Sugar beets are grown in the northern half of the United States. The beet is a root vegetable that is used to produce sugar. The beet is grown in rows and is harvested in the fall. The beet is then processed to extract the sugar. The sugar is then refined and used in a variety of products, including table sugar, high-fructose corn syrup, and other sweeteners.
