DIRECTIONS

1. Adjust pool water pH to 7.2 - 7.4. For pools with copper plumbing test pH lower to 7.0 - 7.2. Use a test kit for this. Aquachem's #112A or #112C Test Kit.
 2. To stabilize pool add that Cyanuric Acid at the rate of 2 pounds per 10,000 gallons. Follow the directions for the use of this as shown on the label.
 3. Add 2 chlorine tablets for every 1,000 gallons of pool water. This should be sufficient to totally destroy all new water and establish a chlorine residual. If there is no chlorine residual on the following day repeat this dosage daily until chlorine is found on the following day. Do not use the pool until a chlorine residual of 1.0 to 1.5 ppm is established. Thereafter add 2 tablets per 1000 gallons weekly. Do not exceed a chlorine residual of 3.0 ppm. Heavy bathing load areas (hot tubs) will be 4.0 ppm. Test pool water frequently with a reliable test kit for chlorine residual and pH. The pool should not be used if the chlorine residual is less than 1.0 ppm. Add tablets through skimmer or circulating heater as tablets will not protect or plastic pool surfaces.
- To determine pool capacity: Rectangular pools - length times width times average depth in feet times 7.5 equals gallons. Round and oval pools - average diameter times average diameter times depth in feet times 5.9 equals gallons. One cubic foot of water equals 7.5 gallons.
