

#### HOW TO USE INSTA-CIOR

To start your pool: 1. Backwash filter. 2. Utilizing your pool test kit adjust pH of pool water to 7.2 — 7.6. Add soda ash (pH Add) or sodium bicarbonate (Alkalinity Plus) to correct an acid condition (less than 7.2). Add sodium bisulfate (Dry Acid) if the pH is greater than 7.6. Maintain pH range of 7.2 — 7.6 for a minimum of six hours before the addition of Insta-Cior and during the entire season. 3. Use two cups of Insta-Cior per 5,000 gallons of water.

After the proper pH range (7.2 — 7.6) and chlorine residuals (1.0 — 1.5) have been established, it is beneficial to add a chlorine stabilizer (cyanuric acid — Fixit) to the pool to prevent extreme fluctuations in the chlorine level. Cyanuric acid (Fixit) is available at most pool dealers and should be added in accordance to the instructions on the package for maximum stabilization of pool water.

#### HOW TO MAINTAIN THE PROPER CHLORINE RESIDUAL

The chlorine residual should be maintained between 1.0 and 1.5 ppm available chlorine as determined by the chlorine test kit. Under normal conditions, this residual can be maintained by the daily addition of about 1/3 cup (2.7 ounces) of Insta-Cior for each 5,000 gallons of pool water — if the pool water is properly stabilized with 30-50 ppm of cyanuric acid (Fixit) pool stabilizer. Severe conditions, such as high temperature or continued use by many people, will require higher daily dosage, whereas smaller doses may suffice in spring and fall or when the pool is not being subjected to normal bathing loads.

The pool water should be super-chlorinated about once each week. Five times the normal daily addition, or a minimum of one cup (eight ounces) per 5,000 gallons of pool water should be added in the evening when the pool will not be used for a minimum of 12 hours. Test the chlorine residual and if above 2.0 ppm do not allow swimming until residual has decreased.

PACKED BY
