

**WOOD PRESERVATION**

Use Wood Preservative on wood in contact with the ground or water. It is a sure treatment of fence posts, poles and other wood products. When the wood is not in contact with the ground as in the case of frames, sub-floors, sills, joists, etc., two applications of this Preservative should be made by swabbing or brushing on a erected structure. If individual members are being treated as in the case of a new building, it is best to soak the wood in this preservative for at least three hours. All joints and ends of treated wood should be given a second treatment.

Fence posts should be treated in a similar manner at least 48 hours before use. A 48 hour soaking treatment will give a heavy coating of preservative and full length coverage. If a post treatment is not possible, posts should be treated with a minimum of three coats on the root end.
