TANK MIX DIRECTIONS FOR FLUE CURED TOBACCO - SUCKER CONTROL

Antak Plus Super Sucker-Stuff:

Mix $1\frac{1}{2}$ gallons Antak and $1\frac{1}{2}$ gallons Drexel Super Sucker-Stuff in 47 gallons of water for each acre. Maintain good agitation during mixing and while spraying.

Antak Plus Super Sucker-Stuff HC:

Mix $1\frac{1}{2}$ gallons Antak and 1 gallon Drexel Super Sucker-Stuff HC in 47 gallons of water for each acre. Maintain good agitation during mixing and while spraying.

Method of Application:

Use the "Tank Mix" of Antak and Super Sucker Stuff or Antak and Super Sucker Stuff HC at the early flower stage.

Tobacco should be topped and suckers over 1 inch long removed. The spray mixture should be directed to the upper $\frac{1}{3}$ of the plant and the sprayer operated at low pressure, similar to that of a contact application. This will insure that the droplets are large enough for some of the mixture to run down the stalk. This "Tank Mix" usually follows a contact sucker control application applied in the button stage. Use normal spray precautions such as you would while applying contact control materials.

- NOTES:
1. One application of the tank mix per growing season.
 2. Do Not harvest within 7 days of application.
 3. All applicable direction, restriction and precautions on the registered label(s) are to be followed.
