NOTICE OF PESTICIDE:  
X Registration  
___ Reregistration  
(under FIFRA, as amended)

Name and Address of Registrant (include ZIP Code):  
Loveland Products Inc.  
P.O. Box 1286  
Greeley, CO 80632-1286

Note: Changes in labeling differing in substance from that accepted in connection with this registration must be submitted to and accepted by the Registration Division prior to use of the label in commerce. In any correspondence on this product always refer to the above EPA registration number.

On the basis of information furnished by the registrant, the above named pesticide is hereby registered/reregistered under the Federal Insecticide, Fungicide and Rodenticide Act.

Registration is in no way to be construed as an endorsement or recommendation of this product by the Agency. In order to protect health and the environment, the Administrator, on his motion, may at any time suspend or cancel the registration of a pesticide in accordance with the Act. The acceptance of any name in connection with the registration of a product under this Act is not to be construed as giving the registrant a right to exclusive use of the name or to its use if it has been covered by others.

This product is registered in accordance with FIFRA sec.3(c)(7)(A) provided that you:

1. Make the following label changes on the front panel:
   A. Within the "For use on" section, delete Clary sage (North Carolina only), because it's not on the cited source product label. Also within this same section change the spelling from "nutternutt" to butternut. Finally, within this same section, you must delete the following language: after corn, delete (North and South Carolina only); after cotton/soybeans, delete (not for soybeans in California); after fallow land delete (Idaho, Oregon, and Washington only); after soybeans delete (not for use in California); and after taro delete (Hawaii only).

(Comments continued on the next page for this Notice of Registration)

If these conditions are not complied with, the registration will be subject to cancellation in accordance with FIFRA section 6(e). Your release for shipment of the product under the enclosed stamped copy of the label constitutes acceptance of these conditions.

Signature of Approving Official:  
Joanne J. Miller  
Date: APR - 7 2005
B. Under "Conifer Specific Use Restrictions" the second bullet must read, "Not for Conifer release in forest management programs or for forest regeneration applications.

C. The third sentence, within Aerial Application, under "Garlic", should read "It is suggested that....roll."

D. The bullet right before the "Grapes (California Only) section, must read "Direct spray toward the base of tree or vines unless specific recommendations in TREE FRUITS, NUTS, VINES-ALL STATES TIMING AND METHOD OF APPLICATION portion of the label allow over-the-top applications. Avoid direct plant contact.

E. Under Conifer Species' "Common Name" the statement "*Not registered for use in California. Also remove that same statement from the "Conifer Transplants and Container Stock section".

F. For the last paragraph for "Warranty Disclaimer and Notice" statement, must read as follow "In no event shall...to such damages to the extent permitted by law.

G. Add your EPA establishment number and net contents to the label.

H. Revise the EPA Registration Number to read, "EPA Reg. No. 34704-877.

2. Submit and/or cite all data required for the registration/reregistration of this product when the Agency requires all registrants of similar products to submit data.

3. Submit one (1) copy of the final printed labeling before you release this product for shipment.

A stamped copy of the label is enclosed for your records.
For use on artichokes (Globe), broccoli, cabbage, cauliflower, celery, citrus (non-bearing), Clary sage (North Carolina only), coffee (Hawaii only), conifer seedbeds, transplants, container stock and selected dogwood vines, corn (North and South Carolina only), cotton, cottonseed meal, soybeans (fallow bed (cotton/soybeans not for soybeans in California)), fallow land (Idaho, Oregon, and Washington only), Garbanzo beans, garlic, guava (Hawaii only), horse-radish, jujube, mint, onions, papaya (Hawaii only), soybeans (not for use in California), taro (Hawaii only), and tree fruit, nuts and vines (which includes almond, apple, avocado, beechnut, Brazil nut, nutmeg, cashew, cherry, chestnut, chincapin, cranberry, date, fig, filbert, grapes, hickory nut, kiwi, loquat, macadamia nut, mayhaws, nettartines, olives, peach, pear, pecan, persimmon, pistachio, plum, pomegranate, prune, quince, walnut).

ACTIVE INGREDIENT
Oxyfluorfen: 2-chloro-1-(3-ethoxy-4-nitrophenyl)-4-(trifluoromethyl) benzene
% BY WT: 22.2%
INERT INGREDIENTS: 77.8%
TOTAL 100.0%

Contains petroleum distillate.
*Equivalent to 2 lbs. active ingredient per gallon.

KEEP OUT OF REACH OF CHILDREN
WARNING
Si usted no entiende el etiqueta, busque a alguien para que le explique un usted en detalle. (If you do not understand the label, find someone to explain it to you in detail).

FIRST AID

IF SWALLOWED:
- Call a poison control center or doctor immediately for treatment advice.
- Have person sip a glass of water if able to swallow.
- Do not induce vomiting unless told to do so by a poison control center or doctor.
- Do not give anything by mouth to an unconscious person.

IF ON SKIN OR CLOTHING:
- Take off contaminated clothing.
- Rinse skin immediately with plenty of water for 15-20 minutes.
- Call a poison control center or doctor for treatment advice.

IF IN EYES:
- Hold eye open and rinse slowly and gently with water for 15-20 minutes.
- Remove contact lenses, if present, after the first 5 minutes, then continue rinsing eye.
- Call a poison control center or doctor for treatment advice.

IF INHALED:
- Move person to fresh air.
- If person is not breathing, call 911 or an ambulance, then give artificial respiration, preferably mouth-to-mouth if possible.
- Call a poison control center or doctor for further treatment advice.

Have the product container or label with you when calling a poison control center or doctor for treatment advice.

FOR A MEDICAL EMERGENCY INVOLVING THIS PRODUCT CALL: 1-800-301-7976.
NOTE TO PHYSICIAN: Contains petroleum distillate; vomiting may cause aspiration pneumonia. Symptoms of exposure through inhalation or ingestion include headache, dizziness, nausea, vomiting, and cramps. Symptoms from eye or skin contact include irritation. Remove victim from area of exposure. Wash off remaining material with plenty of water. Prodable mucosal damage may contraindicate the use of gastric lavage. Treat symptomatically and give supportive therapy. There is no specific antidote.

EPA REG. NO. 34704-
EPA EST. NO. 11603-IS-01

END ZONE HERBICIDE

PRECAUTIONARY STATEMENTS
HAZARDS TO HUMANS AND DOMESTIC ANIMALS
WARNING
Causes substantial but temporary eye injury. Harmful if swallowed or absorbed through the skin. Do not get in eyes or on clothing. Avoid contact with skin. Wash hands before eating, drinking, chewing gum, using tobacco, or using the toilet. Remove contaminated clothing and wash clothes before reuse.

PERSONAL PROTECTIVE EQUIPMENT (PPE)
Some materials that are chemical resistant to this product are listed below. If you want more options, follow the instructions for category G on an EPA chemical resistance category selection chart.

Users should:
Wash hands before eating, drinking, chewing gum, using tobacco, or using the toilet.
Remove clothing immediately if pesticide gets inside. Than wash thoroughly and put on clean clothing.

ENVIRONMENTAL HAZARDS
Do not apply directly to water, to areas where surface water is present, or to intertidal areas below the mean high water mark. Do not contaminate water by cleaning of equipment or disposal of equipment washwaters. This product is toxic to aquatic invertebrates, aquatic plants, wildlife, and fish. Use with care when applying in areas frequented by wildlife or adjacent to any body of water or wetland area. Do not apply when weather conditions favor drift or erosion from target areas.

DIRECTIONS FOR USE
It is a violation of federal law to use this product in a manner inconsistent with its labeling. Do not apply this product in a way that will contaminate workers or other persons, either directly or through drift. Only protected handlers may be in the area during application. For any requirements specific to your State or Tribe, consult the agency responsible for pesticide regulation.

AGRICULTURAL USE REQUIREMENTS
Use this product only in accordance with its labeling and with the Worker Protection Standard, 40 CFR Part 170. This Standard contains requirements for the protection of agricultural workers on farms, forests, nurseries, and greenhouses, and handlers of agricultural pesticides. It contains requirements for training, decontamination, notification, and emergency assistance. It also contains specific instructions and exceptions pertaining to the statements on this label about personal protective equipment (PPE) and restricted-entry interval. The requirements in this box only apply to uses of this product that are covered by the Worker Protection Standard. Do not enter or allow worker entry into treated areas during the restricted entry interval (REI) of 24 hours.

PPE required for early entry to treated areas that is permitted under the Worker Protection Standard and that involves contact with anything that has been treated, such as plants, soil, or water, is: Protective eyewear, coveralls over short-sleeved shirt and short pants, chemical-resistant gloves, such as barrier laminate or Viton > 14 mils, chemical-resistant footwear plus socks, and chemical-resistant headgear for overhead exposure.

ACCEPTED with COMMENTS
In EPA Letter Dated: APR - 7 2005
Under the Federal Insecticide, Rodenticide, and Rodenticide Act as amended, for the pesticide registered under EPA Reg. No.
CHEMIGATION STATEMENT

Refer to the section entitled APPLICATION THROUGH IRRIGATION SYSTEMS - CHEMIGATION for use directions for chemigation. Do not apply this product through any irrigation system unless the instructions for chemigation are followed. If application by chemigation is not specifically listed for a crop, End Zone may not be applied to that crop through irrigation systems.

GENERAL USE INFORMATION

Unless otherwise directed by registered supplemental labels, follow the Directions for Use in each crop group section.

IMPORTANT: Read the entire DIRECTIONS FOR USE and the WARRANTY STATEMENT before using this product. It is not recommended to mix End Zone with other products, fungicides, or insecticides.

CULTURAL CONSIDERATIONS

In order for End Zone herbicide to provide maximum preemergence activity: Prior to application, the soil must be in a condition where weeds can emerge in the presence of this herbicide. If application by chemigation is not specifically listed for a crop, End Zone may not be applied to that crop through irrigation systems. Crops should be transplanted in the most efficient manner to provide the best possible weed control. Weed emergence can be prevented by the use of mulch or temporary initial crop response (leaf cupping or crinkling). Crop response may result from the use of transplanting equipment that is not designed for precision spray. Do not apply more than 8 pints (2.0 lbs. active) of End Zone herbicide to any one acre per application. Do not apply more than 120 gallons of water per acre on any one application of End Zone herbicide.

MIXING DIRECTIONS

Fill the spray tank at least one-third full of clean water. With the pump and agitation running, add the recommended amount of herbicide to the spray tank. The order of addition to the spray tank should be wettable powders first, followed by free-flowing liquids last. Complete filling of the spray tank with water. For all applications of End Zone herbicide except onions where postemergence weed control is desired, add 2 to 4 pints of an 80% active nicosulfoxime surfactant to each gallon of spray. The addition of 4 pints of a 50% active nicosulfoxime surfactant per 100 gallons of spray is recommended to enhance postemergence activity when hard water (greater than 600 ppm) is used as a carrier. Maintain agitation until spraying is completed.

COMPATIBILITY TESTING

Compatibility testing for tank mixing partners: End Zone herbicide may also be used in tank mixtures. Test compatibility of the intended tank mixture before adding End Zone herbicide to the spray tank or mix. Add proportionate amounts of each ingredient to a pint or quart jar, cap, shake, and let set 15 minutes. Formation of precipitates that do not readily redissolve indicates an incompatible mixture that should not be used. Spray equipment should be calibrated carefully before each use. Dosesages listed on this label are for broadcast application. For banding application, the amount of End Zone herbicide used per acre should be reduced according to the following formula:

\[ \text{Band Width (in inches)} \times \text{Rate per Broadcast Acre} = \text{Amount Needed per Acre for Banded Application} \]

CROP USE RECOMMENDATIONS

END ZONE HERBICIDE

EPA REG. NO. 34704

NON-AGRICULTURAL USE REQUIREMENTS

The requirements in this box apply to uses of this product that are not within the scope of the Worker Protection Standard for agricultural pesticides (40 CFR Part 170). The WPS applies when this product is used to produce agricultural plants on ornamental trees, ornamental shrubs, and ornamental vines. Keep unprotected persons out of treated area until sprays have dried.

CHEMICAL STABILITY

Chemically stable in stored granular product when protected from moisture. Do not add End Zone to water in the spray tank unless it is to be mixed at the time of application. Store End Zone in the original container. End Zone should be protected from prolonged exposure to direct sunlight and stored in a cool, dry, well-ventilated place. Do not mix End Zone with other chemicals.

Timing and Method of Application

Treatments should be made after completion of the cultivating operation. End Zone herbicide should be applied in a minimum of 40 gallons of water per acre depending upon the number of susceptible weeds. Spray volume should be increased as weed height and density increase. Use a low-pressure sprayer equipped with flat fan nozzles. Spray equipment should be calibrated carefully before each use. Sprays should be directed to the winter ditches, levees, or flat rows between the artichoke rows. ARTICHOKE FRONDS RECEIVING ACCIDENTAL SPRAY OR DRIFT WILL BE INJURED.

Artichoke (Globe)

Specific Use Restrictions

In addition to the following, also observe GENERAL USE RESTRICTIONS listed at the end of this label.

- Do not apply more than 6 pints (2.0 lbs. active) of End Zone herbicide per treated acre per season as a result of a single application or multiple applications.
- Do not apply End Zone herbicide within 5 days of harvest.
- Avoid direct spray or drift contact of End Zone herbicide with artichoke flowers or buds as severe injury may result.
- Do not apply End Zone herbicide to artichoke plantings within 60 days after cutting back or transplanting.

BROCCOLI, CABBAGE, CAULIFLOWER

Pre-Transplant (Transplant) Application for Preemergence Broadleaf Weed Control

General Information

End Zone is a selective herbicide for preemergence control of certain annual broadleaf weeds. Applications must be made after completion of soil preparation but prior to transplanting of broccolli, cabbage, or cauliflower plants. Transplanting should be completed with minimal soil disturbance. Treated soil surfaces should be left undisturbed after transplanting to obtain greatest benefit of End Zone herbicide on susceptible annual broadleaf weeds during the time period for which weed control is desired. However, timely cultivation after weed emergence will assist in weed control. Pre-transplant applications of End Zone herbicide in broccoli, cabbage, and cauliflower may result in temporary initial crop response (leaf cupping or crinkling). Crop response may be enhanced if crop leaves come in direct contact with treated soil. Crops rapidly outgrow this condition and develop normally. Severe crop response may result from the use of transplants that are under stress due to temperature, disease, fertilizer, nematodes, insects, pests, or storage conditions. The use of young (less than 5 weeks old), extremely succulent transplants grown in containers, less than 1-inch square, may increase the severity of crop injury. Hardening off, increasing the age of transplants, or increasing the size of the rooting container will lessen the possibility and/or severity of crop injury.

Dosage

End Zone herbicide is recommended for use at 1 to 2 pints (0.25 to 0.5 lb. active) per broadcast acre. The lower rate (1 pint per acre) is recommended for preemergence weed control on coarse texture soils with less than 1% organic matter. The 2 pint per acre rate is recommended for preemergence weed control on medium to fine texture soils or soils containing greater than 1% organic matter.

End Zone herbicide will assist in early season annual grass control. However, End Zone herbicide must not be a basic portion of the grass herbicide program. A planned herbicide program for preemergence or postemergence grass control is recommended. Research has shown that severe crop injury can occur if End Zone herbicide is applied to a field that has had an acetanilide herbicide (Dual, Lasso, Ramrod) applied during the current growing season; therefore, it is not recommended.

Weeds Controlled

Carpolewad

Russian, common

Pigwee, Redroot

Smarweed, Pennsylvania

*Applications of End Zone herbicide to muck soils may result in partial control or suppression of the weeds listed.

End Zone herbicide at the rate of 1 to 2 pints per acre may provide partial control or suppression of gaihless, common lambsquarters, and wild mustard.

Method of Application

End Zone herbicide should be thoroughly mixed with clean water at recommended concentrations and added in a minimum of 20 gallons of water per acre. Use conventional or ground sprayer equipment with flat fan nozzles at 20 to 40 psi. Do not exceed 40 psi. Accuracy is critical to the application of End Zone herbicide. Inaccurate calibration sprayer equipment prior to each use. Thoroughly flush the spray equipment (tanks, hoses, pump, boom) with water before and after each use. Residual End Zone herbicide remaining in the spray equipment may damage other crops.

AVOID DRIFT TO ALL OTHER CROPS AND NONTARGET AREAS. DO NOT APPLY WHEN WEATHER CONDITIONS FAVOR DRIFT. END ZONE HERBICIDE IS PHYTOTOXIC TO PLANT FOLIAGE.
END ZONE HERBICIDE
EPA REG. NO. 34704-

Broccoli, Cabbage, Cauliflower
Specific Use Restrictions
In addition to the following, also observe GENERAL USE RESTRICTIONS listed at the end of this label.
• Do not apply more than 2 pints (0.5 lb. active) of End Zone herbicide per broadcast acre per season.
• Do not apply End Zone herbicide preemergence to direct-seeded broccoli, cabbage, or cauliflower.
• Do not apply End Zone herbicide post-transplant or postemergence (over-the-top) to broccoli, cabbage, or cauliflower.

FOR FIELD USE ONLY. Do not apply End Zone herbicide in an enclosed greenhouse structure as injury to plant foliage may result.

CACAO

General Information
End Zone is effective as a preemergence herbicide when used alone for the control of certain annual broadleaf weeds in bearing and non-bearing cacao plantings. Preemergence control is most effective when spray is applied to clean, weed-free soil surfaces. Treated berm or soil surfaces should not be disked or disturbed in any manner as the herbicidal effectiveness of End Zone herbicide may be decreased. Seedling weeds are controlled as they come in contact with soil-applied herbicides during emergence.

End Zone Herbicide Used Alone
Dosage
End Zone herbicide is recommended for preemergence and postemergence control of susceptible weeds at 2 to 8 pints (0.5 to 2.0 lbs. active) per broadcast acre when directed to the orchard floor beneath cacao plants or at a dosage of up to 4 pints per acre as a preplant application. For directed spray applications, cacao transplants must be healthy and of suitable size for field transplanting. Avoid spray contact with cacao foliage as injury may result. Dosages listed are for broadcast application. For banded application, the amount of End Zone herbicide used per acre should be reduced according to the following formula:

\[
\text{Band Width (in inches)} \times \frac{\text{Rate}}{\text{Row Width (in inches)}} = \text{Amount Needed per Acre for Banded Application}
\]

End Zone Herbicide Postemergence
Applications to weeds beyond the four-leaf stage may result in partial control.

Weeds Controlled Postemergence
Apply 2 to 8 pints (0.5 to 2.0 lbs. active) of End Zone herbicide per broadcast acre. Applications to weeds beyond the four-leaf stage may result in partial control.

Weeds Controlled Preemergence
Apply 1 to 2 pints (0.5 to 2.0 lbs. active) of End Zone herbicide per broadcast acre. Applications to weeds beyond the four-leaf stage may result in partial control.

CITRUS (NONBEARING)

In addition to the following, also observe GENERAL USE RESTRICTIONS listed at the end of the label.
• Do not apply more than 2 pints (0.5 lbs. active) per broadcast acre of End Zone herbicide in any single application or 4 pints (1.0 lbs. active) per broadcast acre per year.
• Do not apply End Zone herbicide within one (1) day of harvest.
• Direct spray toward the base of the trees. Avoid spray contact with foliage.

Citrus Use Restrictions
For use on citrus plantings only. End Zone herbicide may be applied to newly planted trees or to young trees that will not bear fruit within one year.

Tank Mixes with End Zone Herbicide

IMPORTANT: Read and observe all label directions before using. When tank mixing, always read all individual manufacturer's labels. In interpreting all labels for the tank mix, the most restrictive situations must apply.

Dosage

For preemergence control of susceptible grassy and broadleaf weeds in citrus plantings, a tank mixture of End Zone herbicide with Devrinol, Simazine, Soltcan, or Surfarn can be applied. Apply at the recommended rates and growth stages to susceptible weed species in a manner described on the respective labels. For postemergence control of susceptible grassy and broadleaf weeds, a tank mixture of paraquat (Gramoxone) or glyphosate (Roundup) with End Zone herbicide or combinations of End Zone herbicide plus Devrinol, Simazine, Soltcan, or Surfarn can be used. Apply at the recommended rates and growth stages to susceptible weed species in a manner described on the respective labels.

Weeds Controlled

In addition to the weeds controlled by End Zone herbicide used alone, control of susceptible weeds listed on the respective labels for the following products is also obtained: Devrinol Simazine* Paraquat (Gramoxone) Soltcan Glyphosate (Roundup) In addition, provides preemergence control of horseweed (marestail).

Citrus (Nonbearing)

Specific Use Restrictions

In addition to the following, also observe the GENERAL USE RESTRICTIONS listed at the end of this label.

• Apply End Zone herbicide only to nonbearing citrus trees.
• Do not apply more than 8 pints of End Zone herbicide (2.0 lbs. active) per broadcast acre in a single application or more than 16 pints (4.0 lbs. active) per broadcast acre during any 12-month period as a result of multiple applications.
• End Zone herbicide or any of the combinations recommended on this label should only be applied to healthy growing trees.
• Do not apply during periods of new foliage growth. Applications should be made after foliage has fully expanded and hardened off.
• Direct spray toward the base of the trees. Avoid direct spray contact on the citrus foliage.

CLARY SAGE

(For Weed Control in Clary Sage Grown and Utilized in the Essence Industry in North Carolina only)

General Information

End Zone herbicide is a selective herbicide which can be used for the control of henbit (Lamium amplexicaule) in Clary Sage (salvia sclarea).

Applications to control henbit during the winter season should be timed to start shortly after the first flush of henbit is in the 2- to 4-leaf stage. Additional applications may be required to control subsequent weed flushes through the spring season. Clary Sage may respond to the topical application with some marginal leaf burn, recovery is rapid. After spraying, henbit will stop growing and slowly die.

Dosage

End Zone herbicide should be applied at a rate of 0.5 to 1 pint per acre (0.12 to 0.25 lb. active). Gallon should be thoroughly mixed with clean water at recommended concentrations and applied in 20 to 50 gallons of water per acre. Apply at 20 to 40 psi.

COFFEE

Bearing and Nonbearing Coffee in Hawaii

General Information

End Zone is effective as a preemergence herbicide when used alone for the control of certain annual grassy and broadleaf weeds in bearing and nonbearing coffee plantings. For postemergence control of certain grassy and broadleaf weeds, a tank mixture of either paraquat (Gramoxone) or glyphosate (Roundup) with End Zone herbicide can be applied to seedling weeds. Check individual product labels to determine suitability and use rates for crop.

End Zone Herbicide Used Alone

Dosage

For preemergence control of susceptible weeds, End Zone herbicide is recommended at 2 to 8 pints (0.5 to 2.0 lbs. active) per broadcast acre as a preemergence application directed to the orchard floor beneath coffee plants or at a dosage of up to 4 pints per broadcast acre as a preplant* application. For directed spray applications, coffee transplants must be healthy and of suitable size for field transplanting. Avoid spray contact with coffee foliage as injury may result. End Zone herbicide may be applied postemergence (over-the-top) to dormant coffee transplants. Applications must only be made prior to bud break to avoid possible phytotoxicity to the coffee foliage. Over-the-top applications made after buds start to swell may result in injury to the coffee plant and are not recommended. Dosages listed on this label are for broadcast application. For banded application, the amount of End Zone herbicide used per acre should be reduced according to the following formula:

Weeds Controlled Postemergence

Apply 2 to 8 pints (0.5 to 2.0 lbs. active) of End Zone herbicide per broadcast acre. Applications to weeds beyond the four-leaf stage may result in partial control.

Purshane, Common Spurge, Garden

Weeds Controlled Preemergence

Apply 2 to 8 pints (0.5 to 2.0 lbs. active) of End Zone herbicide per broadcast acre.

Ageratum Buttonweed Crotalaria

Timing And Method Of Application

Do Not Apply Preplant Or Preemergence To Direct-Seeded Coffee

Treatments should only be applied to healthy coffee stock (as determined by standard commercial growing practices). Care must be taken to prevent direct spray contact with foliage. Coffee foliage receiving accidental spray or drift may be injured. As a preemergence or postemergence treatment to weeds, apply a minimum of 30 gallons of water per acre. Use higher volumes to ensure adequate coverage in high densities of emerged weeds or heavy trash. End Zone herbicide should be directed to the soil and the base of the tree. Use of a low-pressure sprayer equipped with a breakaway boom and flat fan or off-center (OC) nozzles is recommended. Spray equipment should be calibrated carefully before each use.

Tank Mixes With End Zone Herbicide

Important: Read and observe all label directions before using. When tank mixing, always read all individual manufacturer's labels. In interpreting all labels for the tank mix, the most restrictive situations must apply.

For postemergence control of susceptible grassy and broadleaf weeds in coffee plantings, a tank mixture of End Zone herbicide with either glyphosate (Roundup) or paraquat (Gramoxone) may be applied as a directed spray. Apply at recommended rates and growth stages to susceptible weed species in a manner described on the respective labels.

Weeds Controlled Postemergence

In addition to the weeds controlled by End Zone herbicide used alone, control of susceptible weeds listed on the respective labels for the following products is also obtained: paraquat (Gramoxone) glyphosate (Roundup)

Coffee

Specific Use Restrictions

In addition to the following, also observe GENERAL USE RESTRICTIONS listed at the end of this label.

• Do not apply preplant or preemergence to direct-seeded coffee.
• Direct spray toward the base of the trees. Avoid spray contact with foliage.
• End Zone herbicide may be applied as a postemergence (over-the-top) application to dormant transplants. Do not apply over-the-top to coffee transplants after buds start to swell.
• End Zone herbicide or any of the combinations recommended on this label should be applied only to healthy growing transplants under standard commercial growing practices.
• Do not apply more than 8 pints (2.0 lbs. active) per broadcast acre of End Zone herbicide in a single application or 24 pints (6.0 lbs. active) per broadcast acre per year.
• Do not apply End Zone herbicide within one (1) day of harvesting.
• Applications of End Zone herbicide during periods of rapid new foliage growth may cause injury.

CONIFER SEEDBEDS, TRANSPLANTS, CONTAINER STOCK

AND SELECTED FIELD-GROWN DECIDUOUS TREES

General Information

End Zone is effective as a preemergence and/or postemergence herbicide for the control of certain annual grassy and broadleaf weeds in conifer seedbeds, transplants, and container stock, and in selected field-grown deciduous trees. Preemergence control is most effective when spray is applied to clean, weed-free soil surfaces. Treated soil surfaces should not be disturbed as the herbicidal effectiveness of End Zone may be decreased. Seedling weeds are controlled during emergence as they come in contact with the soil-applied herbicide. The most effective postemergence weed control is achieved when End Zone herbicide is applied to seedling weeds less than 4 inches in height.

Occasionally after the use of End Zone herbicide, a spotting, crinkling, or thinning may appear on leaves of conifer and deciduous species. Leaves that receive direct or indirect (drift) spray contact may be injured. The conifer and deciduous species typically outgrow this condition rapidly and develop normally.

IMPORTANT: When applied as directed, the conifer and selected deciduous species listed on this label have shown tolerance to End Zone. It is impossible, however, to evaluate the product on all varieties, biotypes, and cultivars of listed species on this label or under all possible growing conditions. The user should exercise reasonable judgement and caution with this product. Until familiar with results under user growing conditions, limit application of this product to a few plants in a small treated area to determine plant tolerance and extent of injury if such occurs prior to initiating large-scale applications.

Weeds Controlled

When End Zone herbicide is applied preemergence or postemergence at recommended dosages and weed stages, the following grasses and broadleaf weeds are controlled:...
**END ZONE HERBICIDE**

**EPA REG. NO. 34704-**

| *Bernyrdgrass* | Mustard, Blue | Mustard, Tumble |
| *Bedstraw, Catchweed* | Mustard, Wild | Nettle, Burning |
| *Bitterroot, Lesser* | Nightshade, Black | Nightshade, Hairy |
| *Bluegrass, Annual* | Oats, Wild | Orach, Red |
| *Buckwheat, Wild* | Pepperweed, Yellowflower | Pigweed, Prostrate |
| *Burreower* | Pigweed, Redroot | Pimpernel, Scarlet |
| *Carpetweed* | Purslane, Common | Redmaids |
| *Clover, Red* | Rocket, London | Sandspurry, Red |
| *Clove, White* | Shepherdspurse | Sheep'shead, Common |
| *Cocklebur, Common* | Smartweed, Pennsylvania | Sida, Pricky |
| *Crabgrass, Large* | Sonnel, Red (From Seed) | Smilax, Common |
| *Fiddleneck, Coast* | Speedwell, Annual | Smartweed, Arkansas |
| *Filaree, Broadleaf* | Sprout, Prostrate | Spumy, Corn |
| *Filaree, Redstem* | Sprout, Spotted | Tansymustard |
| *Fireweed (Firm Seed)* | *Thistle, Bull* | Tansyseed, Yellow |
| *Flaxweed* | *Thistle, Russian* | Thistle, Ditch |
| *Foxtail,* | *Velevaleaf* | Thistle, Pink |
| *Fiddleneck, Coast* | *Velevaleaf* | Thistle, Red |
| *Forsythia,* | *Wiglthgrass* | Thistle, Yellow |
| *Forsythia,* Tall | *Wiglthgrass* | Thistle, Yellow |
| *Gentian, Tall* | *Wiglthgrass* | Thistle, Yellow |
| *Gentian, Tall* | *Woodbineal, Yellow* | Thistle, Yellow |

**Postemergence Dosage**

- Apply 1 to 2 pints (0.25 to 0.5 lb. active) of End Zone herbicide per broadcast acre with each postemergence application. Depending on subsequent weed flushes, multiple applications may be necessary to achieve season-long weed control.

**Timing And Method Of Application**

- Time preemergence applications to be thoroughly mixed with clean water at recommended concentration and applied at 20 to 40 psi in a minimum of 20 gallons of water per treated acre. Broadcast to beds and irrigate prior to weed emergence with 1 to 14 inches of sprinkler irrigation.

**Tank Mixtures For Selected Field-Grown Conifers**

- Conifer species are tolerant to preemergence and postemergence applications of End Zone herbicide. End Zone herbicide will provide both postemergence and residual preemergence control of many broadleaf weeds and annual grass species.

**Conifer Species**

- End Zone herbicide may be applied to conifer seedbeds of species including the following:

  **Common Name**
  - Douglas Fir
  - Fir
  - Fraser
  - Grand
  - Noble
  - Hemlock
  - Eastern Hemlock

  - Shortleaf
  - Slash
  - Virginia
  - Spruce
  - Blue
  - Dwarf Alberta
  - Norway
  - Sitka

- *Not registered for use in California.*

**Dosage**

- For preemergence or postemergence weed control, apply 4 to 8 pints (1.0 to 2.0 lbs. active) of End Zone herbicide per broadcast acre.

**Timing And Method Of Application**

- For optimum weed control, preemergence applications should be made immediately after transplanting seedlings to weed-free container stock. Postemergence applications should be made to weeds less than 4 inches in height. Two or more applications may be necessary in fall-transplanted conifer fields for season-long weed control. The addition of 0.25% (2 pints per 100 gallons of spray solution) of an 80% active nonionic surfactant, cleared for application on growing crops, enhances End Zone herbicide activity on emerged weeds. End Zone herbicide must be applied only to conifer transplants prior to bud break or after foliage has had an opportunity to harden off. Conifers may be transplanted from seedbeds and sprayed directly providing bud break has not occurred.

- Conifer seedlings or to conifer seedlings prior to transplanting when thoroughly mixed with clean water at recommended concentration and applied as a broadcast application at 20 to 40 psi in a minimum of 20 gallons of water per treated acre.

- Conifer seedlings or to conifer seedlings prior to transplanting when thoroughly mixed with clean water at recommended concentration and applied as a broadcast application at 20 to 40 psi in a minimum of 20 gallons of water per treated acre.

- Conifer species are tolerant to preemergence and postemergence applications of End Zone herbicide. End Zone herbicide will provide both postemergence and residual preemergence control of many broadleaf weeds and annual grass species.

- Conifer species are tolerant to preemergence and postemergence applications of End Zone herbicide. End Zone herbicide will provide both postemergence and residual preemergence control of many broadleaf weeds and annual grass species.

**Conifer Transplants and Container Stock**

- Conifer species are tolerant to preemergence and postemergence applications of End Zone herbicides. Applied postemergence, End Zone herbicide will provide both postemergence and preemergence control of many broadleaf weeds and grasses listed in the WEEDS CONTROLLED SECTION above. Postemergence applications should be applied before bud break or after foliage has had an opportunity to harden off. Conifers may be transplanted from seedbeds and sprayed directly providing bud break has not occurred.

- The following conifer species in addition to species listed under the CONIFER SEEDBED section have been shown to be tolerant to End Zone herbicide.

- Arborvitaee: Red Cedar
  - Thuja occidentalis
  - Thuja orientalis
  - Juniperus chinensis
  - Juniperus horizontalis
  - Juniperus procumbens
  - Juniperus sabina
  - Juniperus scopulorum

- *Not registered for use in California.*

**Important:** Read and follow container labels of tank-mix partners and use as directed by labeling. Follow the most restrictive labeling.
END ZONE HERBICIDE
EPA REG. NO. 34704-

Conifer
Specific Use Restrictions
In addition to the following, also observe GENERAL USE RESTRICTIONS listed at the end of this label.
• Do not apply more than 8 pints (2.0 lbs. active) of this product per broadcast acre per year.
• For optimum weed control, applications should be made prior to meal germination.
• Do not for Conifer release it in forest management programs or for forest reclamation attempts.
• Do not apply End Zone herbicide in an enclosed greenhouse structure as injury to plant foliage may result.
• Do not store or transport treated container stock in an enclosed structure until completion of 4 irrigations (minimum 21 days) as injury to non-labeled plants may occur.
• Always apply End Zone herbicide only to healthy conifer stock. Do not apply End Zone herbicide to conifers that are under stress from excessive fertilizer or soil salts, disease, nematodes, frost, drought, previously applied pesticides, soil insects, or winter injury as severe injury may result.
• Do not graze or feed livestock forage out from areas treated with End Zone.

SELECTED FIELD-GROWN DECIDUOUS TREES

Many field-grown deciduous trees are tolerant to applications of End Zone herbicide directed to the soil base and base of the plant. End Zone herbicide will provide both pre-emergence and post-emergence control of a broadleaf weeds and grasses.

</table>

* Do not apply to maple trees used for production of maple sap or maple syrup.
** Apply as directed to non-bearing trees. For bearing trees fruit, nut, and vine crops, refer to the TREE FRUIT, NUT, VIQNE SECTION of this label for use directions.

Dosage
Apply 2 to 8 pints (0.5 to 2.0 lbs. active) of End Zone herbicide per acre as a spray to the soil area surrounding deciduous plants for pre-emergence or early post-emergence weed control. This product may be applied as a single or split application. DO NOT apply more than 8 pints of product per season.

For spot treatments, refer to the following table for dosage recommendations. Sprays must be uniform and applied to the soil on a spray-to-wet basis. When spraying to control weeds on a pre-emergence or post-emergence basis, 1 gallon of spray mixture should cover 400 square feet. This is equivalent to applying End Zone herbicide at a use rate of approximately one gallon per acre in a spray volume of 110 gallons per acre. It is recommended that an 80% active nonionic surfactant be added to the spray mixture at a rate of 1 tablespoon (0.5 fluid ounces) per gallon of spray when making post-emergence applications.

Timing
End Zone herbicide can be applied after transplanting or to established deciduous trees. For optimum weed control, applications should be made prior to weed germination.

For maximum safety to deciduous species mentioned on this label, post-directed applications of End Zone should be made to the soil prior to bud swell in the spring or after trees have initiated dormancy in the fall. Care must be taken to avoid contact of spray drift or mist with foliage or green bark of deciduous trees.

End Zone herbicide may be phytotoxic to the foliage of non-target plants. Avoid making applications of this product under conditions that favor drift to non-target areas.

Note: Applications made after bud swell may result in injury to deciduous trees and are not recommended. If a nondormant application is required due to weed competition, do not apply during periods of new foliage growth. Applications should be made after foliage has fully expanded and hardened off. Direct spray toward the soil base of the trees and use greater than 50 gallons of water per acre. Splashing soil can carry End Zone herbicide, which may injure the leaves of some deciduous trees.

Method of Application
End Zone herbicide should be directed to the soil. Avoid direct spray or drift onto foliage, flowers, or green bark. Apply in 20 or more gallons of water per acre to provide uniform spray distribution and coverage to the soil surface. Use higher volumes to ensure adequate soil coverage in high densities of emerged weeds or heavy trash. Thorough spray coverage is essential to maximize the postemergence activity of End Zone. Use a low-pressure (20 to 40 psi) sprayer. The use of spray shields that reduce exposure of foliage and bark to End Zone spray is suggested. Spray equipment should be calibrated carefully before each use.

Tank Mixtures for Selected Field-Grown Deciduous Trees

In addition to the weeds controlled by End Zone herbicide used alone, tank mixes with other pre-emergence or post-emergence herbicides registered for this use may provide a broader spectrum of weed control.

End Zone herbicide may be tank mixed with products containing the following active ingredients registered for use in deciduous plantings:
- Glyphosate
- Pendimethalin
- Sethoxydim
- Napropamide
- Propanil
- Oryzalin
- Prometryne

Determine the additional weed species to be controlled and, based on label claims, select the product(s) which would give effective control of the targeted weed(s). When using tank mixes of two or more products, use conditions must be in accordance with the more (most) restrictive of the label limitations and precautions of the mixing partners.

IMPORTANT: Read and follow container labels of tank-mix partners and use as directed. Follow the most restrictive labeling.

Field-Grown Deciduous Trees - Specific Use Restrictions

In addition to the following, also observe GENERAL USE RESTRICTIONS listed at the end of this label.
• Do NOT apply more than 8 pints (2.0 lbs. active) of this product per broadcast acre per year.
• The use directions described here for field-grown deciduous trees do not apply to bearing trees fruit, nut, and wine crops. For selected bearing trees fruit, nut, and vine crops refer to the TREE FRUIT, NUT, VINENE SECTION of this label for use directions.
• Apply this product to the soil surface surrounding trees prior to bud swell or after trees have initiated dormancy in the fall. Although not recommended, if a nondormant application is required, apply as a directed spray when foliage has fully expanded and hardened off. Do NOT apply during periods of new foliage growth.
• Avoid direct or indirect spray contact to foliage flowers and green bark.
• Do NOT apply this product when weather conditions favor drift. Avoid drift to non-target areas. End Zone herbicide is phytotoxic to plant foliage.
• Do NOT apply End Zone herbicide to trees that have been weakened or are under stress from excessive fertilizer or soil salts, disease, nematodes, frost, wind injury, drought, flooding, previously applied pesticides, insects, or winter injury as severe injury may result.
• Do NOT graze or feed livestock forage cut from areas treated with End Zone herbicide.

CORN

FOR USE ONLY AS DIRECTED SPRAY ON FIELD CORN IN CONJUNCTION WITH THE USDA WITCHET WEAED ERADICATION PROGRAM IN NORTH CAROLINA AND SOUTH CAROLINA

General Information
End Zone is a selective herbicide for the control of witchweed (Striga asiatica) and works both pre-emergence and post-emergence against witchweed.

Dosage
Use 2 to 3 pints of End Zone herbicide (0.5 to 0.75 lb. active) per acre for the first application. Use a 2 pint rate (0.5 lb. active) per acre should be the standard use rate with the 3 pint rate (0.75 lb.) per acre for isolated infestations. Repeat treatments should be made at rates of 1 to 2 pints (0.25 to 0.5 lb. active) per acre. Use an 80% active nonionic surfactant spreader in the spray mixture at the rate of 0.25% by water volume or 1 quart in 100 gallons of spray mix.
END ZONE HERBICIDE
EPA REG. NO. 34704-

Timing And Method Of Application
Fields in the witchweed infested area selected for treatment with End Zone herbicide should be examined during the early part of the growing season to determine uniformity of growth and grassy weed pressure. Weedy fields should be cultivated prior to the initial application so as to obtain the best possible soil coverage in the first spray application. Apply during May-August to emerged witchweed before bloom or as soon as possible thereafter. Do not spray on treated cotton. Corn should have a minimum height of 24 inches at the first application. After this application has been made, the fields should be inspected regularly for any breakthrough of the witchweed. If breakthrough occurs, then a second spray should be applied like the first. This application will be made postemergence to the witchweed, preferably before bloom or as soon as possible past the first appearance of witchweed bloom, to avoid seed set.

In all applications, direct the End Zone herbicide spray at the base of the corn plant and uniformly over the entire row surface. Do not spray over the top of the corn, as this may result in severe corn injury. Spray droplets contacting the lower leaves will cause necrotic spotting or streaking of sprayed tissue. Spray should contact only the lower 3 to 8 inches of the corn stalk and any leaves in this zone.

Corn
Specific Use Restrictions
In addition to the following, also observe GENERAL USE RESTRICTIONS listed at the end of this label.
- Do not apply more than 5 pints of End Zone herbicide (1.25 lbs. active) per acre to a corn crop during the growing season.
- Do not apply any application within 60 days of harvest.
- Do not use corn plants from a treated field for green chop, ensilage, forage, or fodder.

COTTON

Post-Directed Spray
General Information
End Zone is a selective herbicide for use as a post-directed application for broadleaf weeds in cotton. Cotton leaves that are accidentally sprayed will exhibit necrotic spotting and may drop from the plant, therefore, care must be exercised to avoid spray contact with the cotton leaves. Crop response may be enhanced if applications are made when excessive soil moisture is present or if rainfall occurs following an application. Cotton will outgrow this condition and continue to develop normally.

Dosage
End Zone herbicide is recommended as a post-directed application at 1 to 2 pints (0.25 to 0.5 lbs. active) per acre.* Optimum control is achieved when 2 pints of End Zone herbicide (0.5 lb. active) per acre are applied to weed seedlings not exceeding 4 true leaves. Effective control of succulent weed seedlings in the 2- to 3-leaf stage can usually be obtained when 1 pint of End Zone herbicide (0.25 lb. active) per acre is applied. See MIXING DIRECTIONS for surfactant recommendation. Weeds should be in the seedling stage, young and actively growing. Do not count cotyledon leaves.

*Dosages listed are for broadcast application. For banded application, the amount of End Zone herbicide used per acre should be reduced according to the following formula:

Rate per acre = Amount Needed per Acre / Band Width

Weeds Controlled Postemergence
When End Zone herbicide is applied as a post-directed application to the recommended weed stage and dosage in cotton, the following weeds are controlled:

Cocklebur, Common
Creosote, Tropic
Groundcherry, Cutleaf
Groundcherry, Wright
Jimsonweed
Lambquarters, Common
Morning glory, Annual (Up to 6-Leaf)
Nightshade, American Black
Nightshade, Black

*Multiple applications may be required for acceptable control.

To obtain the maximum benefit of postemergence activity, encourage weed emergence by irrigating prior to spraying. Irrigate immediately following herbicide application to obtain greatest benefit of preemergence activity from End Zone herbicide on nightshade and groundcherry species.

Method Of Application
Southern And Western Cotton
Accurate, uniform placement of End Zone herbicide spray is essential for effective weed control and to minimize cotton injury. As a directed postemergence application, End Zone herbicide should be applied at 20 to 25 psi using 20 to 40 gallons of spray on a broadcast ace basis. Do not exceed 25 psi. Spray should be directed towards the base of the cotton plant. Cotton foliage receiving accidental spray or drift may be injured. Weeds should be in the seedling stage, young and actively growing.

End Zone herbicide can be applied using a post-direct spray rig with only 2 flat fan nozzles per row, 1 nozzle on each side of the row. Additional care should be taken when adjusting sprayer prior to application. For best coverage, it is suggested to use 4 flat fan nozzles per row, 2 nozzles on each side of the row. The 2 forward nozzles should point forward and downward while the rear nozzles should point to the rear and downward. With either sprayer system, nozzles should be adjusted to cover the weed foliage with minimum contact to the cotton plant. Do not use cone nozzles.

Tank Mixes With End Zone Herbicide
Important: Read and observe all label directions before using. When tank mixing, always read all individual manufacturer's labels. In interpreting all labels for tank mixtures, the most restrictive situations must apply.

Dosage
For postemergence control of susceptible grassy and broadleaf weeds in cotton, a tank mixture of End Zone herbicide with either Bladex®, Karmex® (diuron), or MSMA can be applied as a post-directed application. Apply at the recommended rates and stages to susceptible weed species in a manner described on the respective labels.

Cotton
Southern And Western
Specific Use Restrictions
In addition to the following, also observe GENERAL USE RESTRICTIONS listed at the end of this label.
- Southern Cotton: Do not apply more than 2 pints (0.5 lb. active) per acre broadcast of End Zone herbicide per season as a result of a single application or multiple applications. Do not apply within 80 days of harvest.
- Western Cotton: Do not apply more than 2 pints (0.5 lb. active) of End Zone herbicide per broadcast acre in a single application or more than a total of 4 pints (1 lb, active) of End Zone herbicide per broadcast acre per season as a result of multiple applications. Do not apply within 75 days of harvest.

COTTONWOOD

General Information
End Zone is an effective herbicide for postemergence and preemergence control of certain broadleaf weeds in cottonwood plantings. End Zone herbicide may be applied postemergence or preemergence to the base of the cottonwood tree. Applications must only be made prior to bud break to avoid possible phytotoxicity to the cottonwood foliage. Applications made after bud break may result in injury to the cottonwood plant and are not recommended.

Dosage
Apply 4 to 8 pints (1.0 to 2.0 lbs. active) of End Zone herbicide per broadcast acre for preemergence and postemergence weed control. The addition of 1 quart of an 80% active nonionic surfactant per 100 gallons of spray mix will assist in spray coverage and wetting of weeds for postemergence control.

Weeds Controlled
When End Zone herbicide is applied preemergence or postemergence to woodland seedings (not exceeding 6-leaf stage) at recommended dosages, the following broadleaf weeds are controlled:

 must be made prior to bud break of the cottonwood trees.

Timing
Southern Cotton (Alabama, Arkansas, Georgia, Louisiana, Mississippi, Missouri, New Mexico, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, and Virginia)
Cotton plant height must be a minimum 6 inches or greater. Application to cotton plants less than 6 inches tall may result in severe crop injury and is not recommended. In cotton 6 to 8 inches tall, End Zone herbicide must be applied using rigid precision ground sprayer equipment. The use of spray shields is recommended to avoid spray contact with cotton foliage. Use branch lifters or shields if excessive spray contact on larger cotton plants (6 inches or greater) cannot be avoided by the directed spray.

Western Cotton (Arizona And California)
Cotton plant height must be a minimum 6 inches or greater. Applications to cotton plants less than 6 inches tall may result in severe crop injury and is not recommended. In cotton 6 to 8 inches tall, End Zone herbicide must be applied using rigid precision ground sprayer equipment. The use of spray shields is recommended to avoid spray contact with cotton foliage. Use branch lifters or shields if excessive spray contact on larger cotton plants (6 inches or greater) cannot be avoided by the directed spray.

Timing And Method Of Application
For optimum weed control, End Zone herbicide should be applied prior to weed emergence. Preemergence applications should be made prior to or immediately after transplanting dormant cottonwood seedlings. Applications must be made prior to bud break of the cottonwood trees.

End Zone herbicide should be applied in a minimum of 20 gallons of water per acre depending upon density of emerged weeds. Spray volume should be increased as weed height and density increase. Use a low-pressure sprayer equipped with flat fan nozzles. Spray equipment should be calibrated carefully before each use.

Cottonwood
Specific Use Restrictions
In addition to the following, also observe GENERAL USE RESTRICTIONS listed at the end of this label.
- End Zone herbicide should only be applied to dormant healthy cottonwood stock.
- Do not apply more than 8 pints (2.0 lbs. active) per treated acre per growing season as a result of single or multiple applications.
END ZONE HERBICIDE
EPA REG. NO. 34704-

EUCALYPTUS

General Information
End Zone is an effective herbicide for preemergence and postemergence control of certain broadleaf weeds in permanently established eucalyptus (E. viminalis, E. pulvulenta, E. camaldulensis) plantings.

In new plantings, End Zone herbicide should be applied immediately prior to or immediately following transplanting of dormant eucalyptus seedlings. In established plantings, End Zone herbicide may be applied postemergence (over-the-top) or be post-directed to the base of the eucalyptus tree. Applications must only be made prior to bud break to avoid possible phytotoxicity to the eucalyptus foliage. Applications made after bud break may result in injury to the eucalyptus plant and are not recommended.

Dosage
Apply up to 8 pints (1.0 to 2.0 lbs. active) of End Zone herbicide per broadcast acre for preemergence and postemergence weed control. The addition of 1 quart of an active nonionic surfactant per 100 gallons of spray mix will assist in spray coverage and wetting of weeds for postemergence control.

Weeds Controlled
When End Zone herbicide is applied preemergence or postemergence to weed seedings (not exceeding 6-leaf stage) at recommended dosages, the following broadleaf weeds are controlled:

Weeds Controlled Preemergence

<table>

</table>

Timing And Method Of Application
For optimum weed control, End Zone herbicide should be applied prior to weed emergence. Postemergence applications should be applied to seedling weeds (up to the 6-leaf stage). Applications must be made prior to bud break of either transplants or established eucalyptus trees.

End Zone herbicide should be applied at 20 to 40 psi in a minimum of 20 gallons of water per acre depending upon density of emerged weeds. Spray volume should be increased as weed height and density increase. Use a low-pressure sprayer equipped with flat fan nozzles. Spray equipment should be calibrated carefully before each use.

Eucalyptus
Specific Use Restrictions
In addition to the following, also observe GENERAL USE RESTRICTIONS listed at the end of this label.

*End Zone herbicide only should be applied to dormant healthy eucalyptus stock.

Do not apply more than 8 pints (2.0 lbs. active) per treated acre per growing season as a result of single or multiple applications.

FALLOW BED

Ground Or Aerial Application Of End Zone Herbicide On Fallow Beds

General Information
End Zone herbicide as a preemergence and/or postemergence herbicide when used alone or in a tank mix combination with glyphosate (Roundup) for the control of winter annual broadleaf weeds to be planted to the crops listed below.

<table>
<thead>

</tbody>
</table>

Important: The fallow beds should be worked thoroughly to a depth of at least 2½ inches prior to planting; weed control should not be expected following breaking of the soil surface. FAILURE TO ACHIEVE THOROUGH AND COMPLETE INCORPORATION OR TO FOLLOW THE RECOMMENDED TREATMENT-PLANTING INTERVAL MAY RESULT IN STAND DENSITY AND/OR VIGOR REDUCTION OF THE PLANTED CROP.

Crop injury may be enhanced if newly seeded crops or transplants are under stress due to drought, flooding, excessive fertilizer or soil salts, low soil temperatures, wind injury, hail, frost damage, injury from previously applied pesticides, or injury due to insects or diseases.

EXERCISE EXTREME CARE TO AVOID HERBICIDE CONTACT WITH ANY DESIRABLE DORMANT OR NON-DORMANT CROP, PLANT, TREE, OR VEGETATION AS SEVERE INJURY MAY RESULT.

DIRECT-SEEDING CROPS

End Zone Herbicide Used Alone

Dosage
End Zone herbicide may be applied at 1 to 2 pints (0.25 to 0.5 lbs. active) per broadcast acre. The lower rate (1 pint per acre) should provide up to 4 weeks of preemergence control of susceptible weeds and provide postemergence control of susceptible weeds (up to 4-leaf stage). The higher rate (2 pints per acre) should provide preemergence control of susceptible weeds for up to 8 weeks and postemergence control of susceptible weeds (up to 6-leaf stage). Best preemergence control is achieved when irrigation or rainfall occurs within 3 to 4 weeks following application.

Weeds Controlled
End Zone herbicide should provide preemergence and postemergence control of the following weeds when used at recommended dosages and weed stage.

<table>
<thead>
<tr>
<th>Broadleaf Weed</th>
<th>Mustard Species</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fiddleneck, Coast</td>

</tbody>
</table>

*Thorough spray coverage is essential to maximize the postemergence activity of End Zone herbicide. For postemergence control when applied by air, a tank mixture of End Zone herbicide with glyphosate (Roundup) is recommended.

END ZONE HERBICIDE Mixes With Other Herbicides

End Zone is a contact herbicide, therefore, coverage is essential for acceptable postemergence control. If dense weed populations, oversown weed seedlings, volunteer grains, annual grasses, or unfavorable environmental conditions exist, a tank mixture of End Zone herbicide with glyphosate (Roundup) for postemergence control is recommended.

Tank Mixes With End Zone Herbicide

Important: Read and observe all label directions before using. When tank mixing, always read all individual manufacturer's labels. In interpreting all labels for the tank mix, the most restrictive statements must apply.

Dosage
End Zone herbicide can be tank mixed with glyphosate (Roundup) to obtain postemergence control of annual grassy weeds, volunteer grains, and broadleaf weeds. Tank mix 1 to 2 pints (0.25 to 0.5 lbs. active) of End Zone herbicide with labeled rates of glyphosate (Roundup). Apply at the recommended rates and growth stages to susceptible weed species in a manner consistent with the respective labels.

Method Of Application

Ground Application
End Zone herbicide should be applied in a minimum of 5 gallons of water per acre.
END ZONE HERBICIDE

The volume of water used should be increased as the weeds become taller and more dense. Use a low-pressure sprayer equipped with flat fan nozzles. Spray equipment should be calibrated carefully before each use.

Aerial Application
End Zone herbicide should be applied using a low pressure sprayer equipped with flat fan nozzles. Spray equipment should be calibrated carefully before each use.

Applications should be made at a height of 6 to 10 feet above the soil surface. It is suggested that the nozzles on the spray boom should not be placed any closer to the wing or rotor tips than 1/4 of the span; this will minimize the formation of spray or wing tip vortex roll. Nozzles should be spaced and positioned to produce a uniform spray pattern and to minimize or eliminate the formation of droplets 100 microns or less in diameter.

Avoid Drift
When applying to fallow beds, extreme care must be exercised to prevent spray drift which could result in damage to other crops or desirable vegetation. Use the following guidelines when aerial applications are to be made:

1. Do not apply when the wind direction is not stable, when inversion conditions exist, or when wind velocity exceeds 10 mph.
2. When wind speeds are 5 mph or less, maintain a minimum downwind buffer zone of at least 1 mile from all crops and desirable vegetation, except the following:
   - Maintain a minimum downwind buffer zone of:
     - 150 feet from dormant tree fruit, nut, vine crops, and overwintering sugar beets.
     - 650 feet from garlic, onions, legumes, vines, small grains, seedling sugar beets, and nontargeted vegetable fallow beds.
3. When wind speeds are between 5 and 10 mph, downwind buffer zones in excess of those listed above are suggested.
4. For upwind and side borders, maintain a minimum buffer zone of 150 feet from any nontargeted vegetable fallow bed, crop, or desirable vegetation.

The use of a drift control agent may be required by local regulations. However, the drift control agent may decrease the weed control activity.

Important
Aerial applications must be familiar with the EPA-registered label and follow the use precautions. Spraying End Zone herbicide in a manner other than as recommended is done at the user's risk. Users are responsible for all loss or damage that results from such spraying. In addition, aerial applicators should follow all applicable state and local regulations and ordinances. In interpreting the label and local regulations, the most restrictive situations should apply to avoid drift hazards.

FALLOW BED (COTTON, SOYBEANS)

Ground or Aerial Application of End Zone Herbicide on Fallow Beds (To Be Planted to Cotton or Soybeans)

Not For Use On Fallow Beds To Be Planted To Soybeans In California

General Information
End Zone herbicide is effective as a preemergence and/or postemergence herbicide when used alone or in a tank mix combination with glyphosate (Roundup) or paraquat (Gramoxone) for the control of winter annual broadleaf weeds in fallow beds to be planted to cotton or soybeans. Do not apply End Zone herbicide within 7 days prior to planting. The fallow beds should be worked thoroughly to a depth of at least 2 inches prior to planting. It is important to thoroughly break the soil surface prior to planting. Weed control should not be expected following breaking of the soil surface.

EXERCISE EXTREME CARE TO AVOID HERBICIDE CONTACT WITH ANY DESIRABLE DORMANT OR NON-DORMANT CROP, PLANT, TREE, OR VEGETATION AS SEVERE INJURY MAY RESULT.

End Zone Herbicide Used Alone

Dosage
End Zone herbicide may be applied at 1 to 2 pints (0.25 to 0.5 lb. active) per broadcast acre. The lower rate (1 pint per acre) should provide up to 4 weeks of preemergence control of susceptible weeds and provide postemergence control of susceptible weeds (up to 4-leaf stage). The higher rate (2 pints per acre) should provide preemergence control of susceptible weeds for up to 6 weeks and postemergence control of susceptible weeds (up to 6-leaf stage). Best preemergence control is achieved when irrigation or rainfall occurs within 3 or 4 weeks following application.

Weeds Controlled
End Zone herbicide should provide preemergence and postemergence control of the following weeds when used at recommended dosages and weed stages:

- Buttercup, Sowthistle
- Cheesehead (Maha)
- Evening Primrose, Cutleaf
- Fiddleneck, Coast
- Flare, Broadleaf
- Flare, Redstem
- Geranium, Carolina
- Ground cherry, Cutleaf
- Groundsel, Common
- Herbbit
- Lady'sthumb
- Miner's Lettuce

Dosage
End Zone herbicide can be tank mixed with either glyphosate (Roundup) or paraquat (Gramoxone). Add End Zone herbicide at a rate of 3.5 to 6.5 ounces (0.05 to 0.1 lb. active) per acre to labeled rates of either glyphosate (Roundup) or paraquat (Gramoxone). Apply at the recommended rates and growth stages to susceptible weed species in a manner consistent with the respective labels.

Fallow Bed (Cotton, Soybeans)

Specific Use Restrictions
In addition to the following, also observe GENERAL USE RESTRICTIONS listed at the end of this label. Do not apply more than 2 pints (0.5 lb. active) of End Zone herbicide per acre per fallow season.

END ZONE HERBICIDE EPA REG. NO. 34704

To order a complete copy of the label call 1-800-858-7379.
END ZONE HERBICIDE
EPA REG. NO. 34704

• Do not apply End Zone herbicide within 7 days prior to planting of cotton or soy beans.

FALLOW LAND
For Use Only In Idaho, Oregon, And Washington
General Information
End Zone herbicide is effective as a preemergence and/or postemergence herbicide when used alone or in a tank mix combination with glyphosate (Roundup) for the control of certain annual broadleaf weeds in a fallow land system. End Zone herbicide can be used as an effective tool to reduce weed growth prior to the establishment of a dry soil mulch. Use of this product is restricted to summer follow land that will be planted back the following year to winter wheat, barley, or oats.

End Zone Herbicide Used Alone
Dosage
End Zone herbicide should be used at 0.5 to 2 pints (0.12 to 0.5 lb. active) per broadcast acre.

Weeds Controlled
End Zone herbicide will provide postemergence control and preemergence activity of the following broadleaf weeds when used at recommended dosages.

- Fiddleneck, Coast Herb
- Lettuce, Prickly (China Lettuce)
- Mustard, Blue (Purple Mustard)
- Mustard, Turnip (Jim Hill Mustard)

Timing And Method Of Application
The most effective preemergence weed control is achieved when End Zone herbicide is applied to seedling weeds (less than 4 inches in height). Seedling weeds are controlled as they come in contact with the soil-applied herbicide during emergence.

End Zone herbicide should be applied in 20 to 40 gallons of water per acre depending upon density of emerged weeds. Use a low-pressure sprayer equipped with flat fan nozzles. Spray equipment should be calibrated before each use.

Tank Mixes With End Zone Herbicide
Dosage
For postemergence control of annual grassy weeds, End Zone herbicide can be tank-mixed with glyphosate (Roundup). Tank mix 0.5 to 2 pints (0.12 to 0.5 lb. active) of End Zone with 0.75 to 1 pint (0.38 to 0.5 lb. active) of glyphosate (Roundup) for each acre treated. Refer to the FALLOW AND REDUCED TILLAGE SYSTEM section on the glyphosate (Roundup) label for specific use directions and restrictions. Fill the spray tank at least one-third full of clean water and add the recommended amounts of End Zone herbicide and glyphosate (Roundup) while the pump and agitator are running. Complete filling of the spray tank with water. Add 1 quart of a compatible 80% active nonionic surfactant, directed for use on growing crops, per 100 gallons of spray. Maintain agitation until spraying is complete.

Fallow Land Specific Use Restrictions
In addition to the following, also observe GENERAL USE RESTRICTIONS listed at the end of this label.

• When tank mixing, always read all individual manufacturers' labels. In interpreting all labels for the tank mixture, the most restrictive statements must apply.

GARBANZO BEANS
For Use Only In California And Arizona
General Information
End Zone herbicide is effective as a preemergence herbicide when used alone for the control of certain annual broadleaf weeds in garbanzo beans. Preemergence control is most effective when spray is applied to clean, weed-free soil surfaces. Seedling weeds are controlled as they come in contact with soil-applied herbicide during emergence. Timely cultivations will usually assist in weed control.

Garbanzo beans are tolerant to preemergence applications of End Zone herbicide, however, under certain conditions, End Zone herbicide can cause severe but temporary crop injury. Heavy splashing rain shortly after crop emergence or wet soil conditions during early growth stages can produce leaf cupping, crinkling, stunting, or defoliation of the garbanzo seedlings. When injury occurs, it is often limited to the first few leaves that develop shortly after crop plants emerge from the soil. Delays in crop development and yield loss may result. Garbanzo beans do recover from this injury with little to no impact on yield.

End Zone Herbicide Used Alone
Dosage
End Zone herbicide is recommended for preemergence control of susceptible winter annual broadleaf weeds at 1 pint (0.25 lb. active) per broadcast acre.

Weeds Controlled Preemergence
End Zone herbicide used alone at recommended dosages provides preemergence control of the following broadleaf weeds:

- Ground, Common
- Mallow, Little (Mauve)

Timing And Method Of Application
As a preemergence application, apply in a minimum of 20 gallons of water per acre. Use conventional ground spray equipment to make a single broadcast application, after planting but prior to weed and crop emergence, with flat fan or hollow cone nozzles. Spray equipment should be calibrated carefully before each use.

Garbanzo Beans
Specific Use Restrictions
In addition to the following, also observe GENERAL USE RESTRICTIONS listed at the end of this label.

• Do not apply more than 1 pint (0.25 lb. active) per broadcast acre of End Zone herbicide in a single application.
• Do not feed beans, vines, or hay.

GARLIC
For Use Only In California
End Zone is a selective herbicide for postemergence application to direct-seeded and transplanted garlic for early postemergence control of certain annual broadleaf and grass weeds. Initial spray application should be made only when the garlic have reached the development stage specified in the DOSAGE section and the SPECIFIC USE RESTRICTIONS section of this label. On garlic transplants, spray as soon after transplanting as practical. End Zone herbicide can cause necrotic lesions, twisting, pigtailing, or stunting of the garlic plants. Injury will be more severe if applications are made immediately following or during cool, wet weather and/or if applications are made prior to the development stage of the garlic plants as specified in the DOSAGE section and the SPECIFIC USE RESTRICTIONS section of this label.

Dosage
Seeded Garlic

- Northeastern States (Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Rhode Island, And Vermont)

End Zone herbicide is recommended for postemergence control at 2 to 4 fluid ounces (0.02 to 0.06 lb. active) per acre when applied postemergence to seeded garlic that have at least three (3) true leaves. Multiple treatments at the aforementioned rate may be applied. Do not apply more than 2 pints (0.5 lb. active) per broadcast acre of End Zone herbicide as a result of multiple applications in one season.

- Western States (Arizona, Colorado, Idaho, Nevada, New Mexico, Oregon, Texas, Utah, And Washington)

End Zone herbicide is recommended for postemergence control at 0.5 pints (0.12 lb. active) per acre when applied postemergence to garlic that have at least two (2) true leaves. Multiple treatments at the aforementioned rates may be applied. Do not apply more than 2 pints (0.5 lb. active) per broadcast acre of End Zone herbicide as a result of multiple applications in one season.

California Only
General Information

- California

Garlic: Response

- For broadcast application, after 1 pint (0.25 lb. active) per broadcast acre as a preemergence application to garlic. Methods of application may be ground, sprinkler, or aerial.
- Ground Application: If applied using ground application equipment, End Zone herbicide should be applied in a minimum of 20 gallons per acre. Use conventional ground sprayer equipment with flat fan nozzles. Spray equipment should be calibrated carefully before each use.
- Aerial Application: If applied using aerial application, End Zone herbicide should be applied via sprinkler irrigation systems. For application using sprinkler (solid set or portable lateral) irrigation systems, apply specified dosage of End Zone per acre as described above. Follow all directions given in the supplemental labeling entitled APPLICATION THROUGH IRRIGATION SYSTEMS - CHEMIGATION when making applications using sprinkler irrigation systems.
- Air Blast Application: If applied using aerial application, End Zone herbicide should be applied using a medium or hollow cone nozzles and a spray pressure less than 40 psi to deliver a minimum spray volume of 10 gallons per acre. Applications should be made at a height of 6 to 10 feet above the soil surface. It is suggested that the nozzles on the spray boom should not be placed any closer to the wing or rotor tips than 1/8 of the span; this will minimize the formation of spray or wing tip vortex roil. Nozzles should be spaced and positioned to produce a uniform spray pattern and to minimize or eliminate the formation of droplets 100 microns or less in diameter.
- Garlic Response to Preemergence Applications With End Zone Herbicide: A chronic band around some of the leaves may be observed after the first irrigation (or rainfall) following garlic emergence. Symptoms may be more severe if garlic emerges under cool, wet, overcast, or foggy weather. This condition is temporary and should not affect the vigor or development of the garlic plant.

Postemergence (and Directed) Garlic Applications in California

- Apply End Zone herbicide at rates up to 1 pint (0.25 lb. active) per broadcast acre as a postemergence (or directed) application in garlic. The garlic must be at least 12 inches in height at application. Weeds should be at the seedling stage, rosette, and actively growing. Methods of application may be post-directed or by sprinkler chemigation.
- Post Direct Application: For banded application, the amount of End Zone herbicide used per acre should be reduced according to the following formula:

\[
\text{Band Width (in inches)} \times \text{Rate per lb. per Acre} = \text{Amount Needed per Acre}
\]

- Row Width (in inches) 
- Broadcast Acre 
- For Banded Application

- A circular, uniform placement of End Zone herbicide spray is essential for effective weed control and to minimize garlic injury. As a directed, postemergence application, End Zone herbicide should be applied using a low-pressure sprayer using a minimum of 20 psi.
END ZONE HERBICIDE
EPA REG. NO. 34704

gallons of spray on a broadcast acre basis. Apply End Zone herbicide as a directed treatment to the soil area at the base of the plants and to the adjacent bed top and furrow areas. Nozzles should be adjusted to cover the weed foliage with minimum contact to the garlic plant. Reduce tractor speed and smooth furrows to minimize excessive bouncing of the spray boom.

Sprinkler Chemigation: If End Zone herbicide is to be applied via sprinkler irrigation, follow all crop and application directions listed for sprinkler chemigation. For application using sprinkler (solid set or portable lateral) irrigation systems, apply specified dosage of End Zone per acre as described above. Follow all directions given in the supplemental labeling entitled APPLICATION THROUGH IRIGATION SYSTEMS - CHEMIGATION when making applications using sprinkler irrigation systems.

Garlic Response to Postemergence Applications With End Zone Herbicide: End Zone herbicide may cause chlorotic leaf banding, necrotic lesions, or stunting of the garlic plants. Symptoms will be more severe if applications are made during cool, wet, overcast, or foggy weather. Garlic will outgrow these conditions and continue to develop normally.

AVOID DRIFT: WHEN APPLYING End Zone TO GARLIC IN CALIFORNIA, EXTREME CARE MUST BE EXERCISED TO PREVENT SPRAY DRIFT WHICH COULD RESULT IN DAMAGE TO OTHER CROPS OR DESIRABLE VEGETATION.

WHEN APPLYING BY AIR OR THROUGH SPRINKLER CHEMIGATION SYSTEMS, USE THE FOLLOWING GUIDELINES:

1. Do not apply when the wind direction is not stable, when inversion conditions exist, or when wind velocity exceeds 10 mph.
2. When wind speeds are 5 mph or less, maintain a minimum downwind buffer zone of at least ½ mile from all crops and desirable vegetation, except the following: Maintain a minimum downwind buffer zone of:
   - 150 feet from dormant trees, dormant vines, and overwintering sugar beets.
   - 650 feet from beans, legumes, small grain, seedling sugar beets, pastures, and vegetable fallow beds.
3. When wind speeds are between 5 and 10 mph, downwind buffer zones in excess of those listed above are suggested.
4. For upwind and side bores, maintain a minimum buffer zone of 150 feet from any vegetable fallow bed, crop, or desirable vegetation.

Cultural Considerations for use in California

On mineral soils, in order to provide maximum preemergence activity, the soil surface should be smooth and free of excess trash (clippings, dead weeds, etc.). Cultural practices that result in redistribution or disturbance of the soil surface after spraying or that mix untreated soil in treated areas will reduce the effectiveness of the treatment. The best results from End Zone herbicides are from applications on established beds that are left undisturbed during the time period for which weed control is desired.

All Other States

End Zone herbicide is recommended for postemergence control at 0.5 pints (0.12 lb. active) per acre when applied postemergence to garlic that have at least two (2) true leaves. Multiple treatments at the aforementioned rates may be applied. Do not apply more than 2 pints (0.5 lb. active) per broadcast acre of End Zone herbicide as a result of multiple applications in one season.

Transplanted Garlic

Transplanted garlic are most tolerant of a postemergence application immediately after transplanting. For all states except the Northeastern states listed under the DOSAGE-SEEDED GARLIC section, an application up to 2 pints (0.5 lb. active) per broadcast acre two days after transplanting may be made. If less than ½ pint per acre are applied, a second application can be made two weeks or more after transplanting. Do not exceed the maximum use rate of 2 pints (0.5 lb. active) per broadcast acre of End Zone herbicide as a result of multiple applications in one season.

For transplanted garlic in the Northeastern states, apply the same rates listed in the DOSAGE-SEEDED GARLIC section within two days after transplanting.

Dosages listed are for broadcast application. For banded application, the amount of End Zone herbicide used per acre should be reduced according to the following formula:

\[
\text{Band Width (in inches) } \times \text{ Rate per Broadcast Acre} = \text{Amount Needed per Acre for Banded Application}
\]

Weeds Controlled

End Zone herbicide will provide postemergence control of the following weeds when applied at the recommended dosage and leaf stage (2 to 4 leaves).

- Camel Grass (Arruval) Puncturevine
- Evening Primrose, Cutleaf
- Groundsel, Common Rocket, London
- Mallow, Little (Mallow) Sage, Lanceleaf
- Nightshade, Black Shepherdspurce
- Pigweed, Prostrate Sour thistle, Annual
- Pigweed, Redroot

Specific weeds controlled at rates recommended for use in Northeastern States (see DOSAGE section).

Timing And Method Of Application

For best postemergence control of susceptible weeds, apply when the weeds are in the 2- to 4-leaf stage. Application of End Zone herbicide after the weeds exceed the maximum leaf stage may result in reduced weed control. More than one postemergence application may be necessary to control subsequent weed flushes. End Zone herbicide should be thoroughly mixed with clean water at recommended concentration and applied in a minimum of 40 gallons of water per acre. Use conventional ground spray equipment with flat fan spray nozzles at 20 to 40 psi. Accurately calibrate spray equipment prior to each use. Avoid drift to all other crops and non-target areas. Thorougly flush the spray equipment (tank, hose, pump, boom) with water before and after each use. Residual End Zone herbicide remaining in spray equipment may damage other crops.

Garlic

Specific Use Restrictions

In addition to the following, also observe GENERAL USE RESTRICTIONS listed at the end of this label.

- In all states except Northeastern states, do not start spraying until the garlic (direct-seeded) have two (2) fully developed true leaves. In the Northeastern states (Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Rhode Island, Vermont), do not start spraying until the garlic (direct-seeded) have three (3) fully developed true leaves. Applications made prior to the recommended garlic development stage may result in serious injury and are not recommended.
- Do not apply more than a total of 2 pints (0.5 lb. active) per acre of End Zone herbicide during one use season.
- Do not apply within 60 days of harvest.
- Use only on dry bulb garlic.
- Do not apply to garlic grown for seed.
- Tank mixtures of End Zone herbicide with oils, surfactants, liquid fertilizers, or pesticides may result in enhanced crop response-injury and are the responsibility of the user.
- Do not apply End Zone herbicide preemergence to direct-seeded garlic.
- Do not apply to garlic plants that are under stress due to drought, flooding, excessive fertilizer or soil salts, storage conditions, wind injury, hail, frost damage, injury from previously applied pesticides, or injury due to insects, nematodes, or diseases.

GUAVA

For Use Only In Hawaii

General Information

End Zone is effective as a preemergence herbicide when used alone for the control of certain annual broadleaf weeds in bearing and nonbearing guava plantings.

For postemergence control of certain grassy and broadleaf weeds, a tank mixture of either paraquat (Gramoxone) or glyphosate (Roundup) with End Zone Herbicide can be applied to seedling weeds. Check individual labels to determine suitability and use rates for crop.

End Zone Herbicide Used Alone

Dosage

End Zone herbicide is recommended for postemergence control of susceptible weeds at 2 to 8 pints (0.5 to 2.0 lbs. active) per broadcast acre.

For preemergence control of susceptible weeds, use 5 to 8 pints (1.25 to 2.0 lbs. active) of End Zone herbicide per broadcast acre.

Weeds Controlled Postemergence

Apply 2 to 8 pints (0.5 to 2.0 lbs. active) of End Zone herbicide per broadcast acre. Applications to weeds beyond the 4-leaf stage may result in partial control.

- Purslane, Common Sperge, Garden
- Butterweed Sperge, Garden
- Crotalaria

Weeds Controlled Preemergence

Apply 5 to 8 pints (1.25 to 2.0 lbs. active) of End Zone herbicide per broadcast acre.

- Agaratum Purslane, Common
- Butterweed Sperge, Garden
- Crotalaria

Timing And Method Of Application

Treatments should be applied only to healthy guava trees. Care must be taken to prevent direct spray or drift from contacting green stems, fruit, or balsage as injury may result. Applications should be made only after new foliage has hardened off or injury may result.

As a preemergence or postemergence treatment to weeds, apply in a minimum of 15 gallons of water per acre. Use higher volumes to assure adequate coverage in high densities of emerged weeds or heavy trash. End Zone herbicide should be directed to the soil and the base of the tree. Use of a low-pressure sprayer equipped with a breakaway boom and flat fan or off-center (OC) nozzles is recommended. An off-center nozzle positioned at the end of the boom may be desired. Spray shields are suggested for use in young trees.

Tank Mixes With End Zone Herbicide

Important: Read and observe all label directions before using. When tank mixing, always read all individual manufacturers' labels. In interpreting all labels for the tank mixture, the most restrictive situations must apply.

Doseage

For postemergence control of susceptible grassy and broadleaf weeds in guava plantings, a tank mixture of End Zone herbicide with either paraquat (Gramoxone) or glyphosate (Roundup) can be used. Apply at recommended rates and growth stages to susceptible weed species in a manner described on the respective labels.

Weeds Controlled Postemergence

In addition to the weeds controlled by End Zone herbicide used alone, control of susceptible weeds listed in the respective labels for the following products is also obtained:

- Paraquat (Gramoxone)
- Glyphosate (Roundup)

Guava

Specific Use Restrictions

In addition to the following, also observe GENERAL USE RESTRICTIONS listed at the end of this label.
END ZONE HERBICIDE
EPA REG. NO. 34704-

- Do not apply more than 8 pints (2.0 lb. active) per broadcast acre of End Zone herbicide in a single application or more than 16 pints (4.0 lb. active) per season.
- Do not apply End Zone herbicide within 1 day of harvest.
- Direct spray toward the base of the trees. Avoid direct plant contact.
- End Zone herbicide or any of the combinations recommended on this label should be applied only to healthy growing trees.
- End Zone applications should be made only after new foliage has hardened off.

HORSERADISH

General Information
End Zone is a selective herbicide recommended for preemergence control of certain broadleaf weeds. Applications must be made after the horseradish roots have been planted and prior to plant emergence. (Emergents that receive direct or indirect (drift) spray contact will be injured). It may be desirable to cultivate immediately prior to application to remove germinated weeds.

Do not use End Zone herbicide on horseradish plantings that are weak or under stress due to temperature, disease, fertilizer, nematodes, insects, pesticides, drought, or excessive moisture.

Dosage
Apply End Zone herbicide at a rate of 2 pints (0.5 lb. active) per broadcast acre as a pre-emergence application to horseradish.

Weeds Controlled
End Zone herbicide will provide preemergence control of the following weeds when used at the recommended dosage:
- Lambsquarters, Common
- Pigweed, Redroot
- Purslane, Common

Timing And Method Of Application
End Zone herbicide should be thoroughly mixed with clean water at recommended concentrations and applied in a minimum of 20 gallons of water per acre. Use conventional ground spray equipment with flat fan nozzles at 20 to 40 psi. Accurately calibrate spray equipment prior to each use.

HORSEDAIS

Specific Use Restrictions
In addition to the following, also observe GENERAL USE RESTRICTIONS listed at the end of this label.
- Do not apply more than 2 pints (0.5 lb. active) of End Zone herbicide per broadcast acre as a single application.

JOJOBA

General Information
End Zone is a selective herbicide for postemergence and preemergence control of certain broadleaf weeds in jojoba. End Zone herbicide should be post-directed to the base of the jojoba plant to avoid possible phytotoxicity to the jojoba foliage. Over-the-top applications may exhibit burning, crinkling, or bronzing of jojoba foliage, particularly to the youngest leaves, flowers, or buds present at the time of application.

Dosage
End Zone herbicide is recommended for postemergence and preemergence control of susceptible seedling weeds (up to 12 inches in height) at 8 pints (2.0 lb. active) per broadcast acre. For optimum residual control, apply during the fall or winter. Early postemergence control of susceptible seedling weeds (less than 8 inches in height), apply End Zone herbicide at a rate of 4 pints (1.0 lb. active) per broadcast acre.

Weeds Controlled Postemergence
- Fiddleneck, Coast
- "Filaree, Broadleaf"
- "Filaree, Redstem"
- "Filaree, Whitestem"
- Groundsel, Common
- Henbit
- Mallow, Little (Malva, Cheeseweed)

*Highest rate may be required for acceptable preemergence control.

**End Zone herbicide at the 8 pint rate (2.0 lb. active) will control filaree if no applications beyond the 4-inch stage. Applications to filaree beyond the 4-inch stage may result in partial control.

Weeds Controlled Preemergence
- Buckover
- Fiddleneck, Coast
- Filaree, Broadleaf
- Filaree, Redstem
- Filaree, Whitestem
- Groundsel, Common
- Henbit
- Knotweed, Prostrate
- Lambsquarters, Common

Timing And Method Of Application
Apply the first application of End Zone herbicide after jojoba plants have grown to a minimum 5-inch height or greater. Additional applications should be applied as needed for post and preemergence weed control. Weed height should not exceed 12 inches or unsatisfactory weed control may result.

End Zone herbicide should be applied in a minimum spray volume of 40 gallons of water per acre depending upon density of emerged weeds. Spray volume should be increased as weed height and density increase. Use a low-pressure sprayer equipped with flat fan nozzles. Spray equipment should be calibrated carefully before each use.

Jojoba

Specific Use Restrictions
In addition to the following, also observe GENERAL USE RESTRICTIONS listed at the end of this label.
- Avoid direct spray or drift contact of End Zone herbicide with jojoba flowers or buds as severe injury may result.
- Do not apply more than 8 pints (2.0 lb. active) per broadcast acre in a single application.

MINT (SPEARMINT, PEPPERMINT)

For Use In California, Idaho, Montana, Nevada, Oregon, South Dakota, Utah And Washington

General Information
End Zone is a selective herbicide for the control of certain annual grasses and broadleaf weeds in spearmint and peppermint grown in California, Idaho, Montana, Nevada, Oregon, South Dakota, Utah, and Washington. Applications should only be made to spearmint and peppermint that are dormant.

Method Of Application
Application must be made prior to new spring growth or severe crop injury may result. End Zone herbicide should be thoroughly mixed with clean water at recommended concentration and applied at 20 to 40 psi in 20 to 40 gallons of water per acre.

Weeds Controlled
When End Zone herbicide is applied as a dormant application to doppealures in spearmint and peppermint, the following annual weeds are controlled:
- Bedstraw, Catchweed
- *Cress, Red
- *Cress, Yellow
- *Dandelion, Common
- Vermilion
- *Ryegrass, Italian
- Shepherdspurse
- Mustard, Blue (Purple Mustard)
- Sowthistle, Annual

*Control of annual grasses is best obtained when End Zone herbicide is applied prior to emergence. Postemergence control of winter annual grasses is generally unsatisfactory if applications are made after the 1- to 2-leaf stage.

Western Oregon
Peppermint (Willamette Valley)
Apply 2 to 3 pints (0.5 to 0.75 lb. active) of End Zone herbicide from November to February to dormant peppermint only. Treatments in January or February generally provide better residual preemergence control of annual broadleaf weeds. Full season weed control should not be expected from this treatment.

DO NOT APPLY END ZONE HERBICIDE IN THE WILLAMETTE VALLEY TO MINT THAT HAS BEEN PLOWED.

Oregon And Washington (East Of Cascades), California, Montana, Idaho, Nevada, South Dakota, And Utah
Spearmint And Peppermint
Apply 2 to 3 pints (1.0 to 1.2 lb. active) of End Zone herbicide from December through March to dormant mint only. Later winter applications will provide maximum activity on summer weeds. Summer grass control may be inconsistent. For best results, allowed fields should be harrowed to provide a smooth surface prior to application. Plowed fields should not be harrowed after End Zone herbicide has been applied as soil disturbance will decrease the herbicidal effectiveness. In tilled-irrigated fields, combating must be done prior to application. Corrugating after application can cover treated rows with untreated soil resulting in poor weed control.

Mint (Spearmint And Peppermint)
(For Use In California, Idaho, Montana, Nevada, Oregon, South Dakota, Utah And Washington)
Specific Use Restrictions
In addition to the following, also observe GENERAL USE RESTRICTIONS listed at the end of this label.
- Do not apply more than one application of End Zone herbicide per season.
- Apply End Zone herbicide to healthy spearmint and peppermint. Do not apply to spearmint or peppermint that has been weakened by disease, drought, flooding, excessive fertilizer, soil salts, previously applied pesticides, nematodes, soil insects, or winter injury as severe injury may result.

MINT (SPEARMINT, PEPPERMINT)
GROWN ON MUCK SOILS ONLY IN
INDIANA, MICHIGAN, MONTANA, NORTH DAKOTA, SOUTH DAKOTA, WISCONSIN

General Information
End Zone herbicide is a selective herbicide that can be used for the control of certain annual broadleaf weeds in dormant spearmint and peppermint. Applications should be made prior to the emergence of spearmint and peppermint that is grown on muck soils. Applications made after the spearmint and peppermint emerge will result in severe injury.
Weeds Controlled Postemergence and Preemergence
When End Zone herbicide is applied at recommended dosages in spear:plant and pepper., the following weeds are controlled:

Knowleud, Prostrate
Pigweed, Redroot

Dosage
End Zone herbicide should be applied at a rate of 4 to 6 pints (1.0 to 1.5 lb. active ingredient) per acre. When used postemergence (to the weeds) add an 80% active nonionic surfactant at the rate of one quart per 100 gallons of spray solution. Applications should be made before the weeds exceed four inches. It is important that applications of End Zone herbicide be made prior to the emergence of the spearplant and peppermint. End Zone herbicide should be thoroughly mixed with clean water at recommended concentrations and applied in 20 to 40 gallons of water per acre. Apply at 20 to 40 psi.

Mint (Spearmint, Peppermint)
(For Use On Mint Grown On Muck Soils Only In Indiana, Michigan, Montana, North Dakota, South Dakota, Wisconsin)
Specific Use Restrictions
In addition to the following, also observe GENERAL USE RESTRICTIONS listed at the end of this label.
• Apply End Zone herbicide only to spearmint and peppermint grown on muck soils (muck soils should have an organic matter of 20% or greater).
• Always apply End Zone herbicide to healthy spearmint and peppermint. Do not apply to spearmint or peppermint that has been weakened by disease, nematodes, soil insects, or winter injury, as severe injury may result.
• Do not apply End Zone herbicide to spearmint or peppermint that has emerged.

Generic Information
End Zone herbicide is recommended for postemergence and preemergence control of certain broadleaf weeds in non-crop areas.

Weeds Controlled Postemergence (weeds up to 4 inches high)
Apply 2 to 8 pints (0.5 to 2.0 lb. active) of End Zone herbicide per broadcast acre. Applications to weeds beyond the 4-inch stage may result in partial control.

Mallow, Little (Malva) Purslane, Common
Shepherdspurse

Weeds Controlled Preemergence
Apply 5 to 8 pints (1.25 to 2.0 lbs. active) per broadcast acre.

Knowleud, Prostrate Pigweed, Redroot
Lambquarters, Common Purslane, Common
Leefuca, Prickly Shepherdspurse
Mallow, Little (Malva) Shepherdspurse
Shepherdspurse

End Zone herbicide should be applied at a rate of 4 to 6 pints (1.0 to 1.5 lb. active ingredient) per acre. When used postemergence (to the weeds) add an 80% active nonionic surfactant at the rate of one quart per 100 gallons of spray solution. Applications should be made before the weeds exceed four inches. It is important that applications of End Zone herbicide be made prior to the emergence of the spearplant and peppermint. End Zone herbicide should be thoroughly mixed with clean water at recommended concentrations and applied in 20 to 40 gallons of water per acre. Apply at 20 to 40 psi.

NON-CROP USE ON RIGHT-OF-WAY SITES
(SUCH AS FENCE ROWS, STORAGE AREAS, UTILITY RIGHT-OF-WAYS, NON-GRAZED MEADOWS, ROADSIDES, FARMIESTDS, ETC.)

End Zone herbicide is recommended for postemergence and preemergence control of certain broadleaf weeds in non-crop areas.

Timing and Method of Application
End Zone should be applied in a minimum of 40 gallons of water per acre (10 gallons of water per acre for orchard use) for application to orchard or vineyard use. Best preemergence results are achieved when spray is applied to a relatively weed-free soil surface. The volume of water used should be increased as the weeds become taller and more dense. Use a low-pressure sprayer equipped with flat fan nozzles. Spray equipment should be calibrated carefully before each use. The use of an 80% active nonionic surfactant should be added to the spray mixture at a rate of 0.125% v/v (1 pint per 100 gallons of spray mix) when using the control of weed in North and South Carolina.

Tank Mixes With End Zone Herbicide
Important: Read and observe all label directions before using. When tank mixing, always read all individual manufacturer’s labels. In interpreting all labels for the tank mixture, the most restrictive situations must apply.

Dosage
For preemergence control of susceptible grassy and broadleaf weeds, a tank mixture of End Zone herbicide with diuron or simazine can be applied. Apply at the recommended rates and growth stages to susceptible weed species in a manner described on the respective labels.

For postemergence control of susceptible grass and broadleaf weeds, a tank mixture with paraquat (Gramoxone) or glyphosate (Roundup) with End Zone herbicide can be used. Apply at the recommended rates and growth stages to susceptible weed species in a manner described on the respective labels.

Specific Use Restrictions
In addition to the following, also observe GENERAL USE RESTRICTIONS listed at the end of this label.
• Do not feed or allow animals to graze on any areas treated with End Zone herbicide.

ONIONS

General Information
End Zone is a selective herbicide for postemergence application to direct-seeded and transplanted onions for control of certain annual broadleaf and grass weeds. Initial spray application should be made only when the onions have reached the development stage specified in the DOSAGE section and the SPECIFIC USE RESTRICTIONS section of this label. On onion transplants, spray as soon before or after transplanting. End Zone herbicide can cause necrotic lesions, burning, pitting, or stunting of the onion plants. Injury will be more severe if applications are made immediately following or during cool, wet weather and/or if applications are made prior to the development stage of the onion plants as specified in the DOSAGE section and the SPECIFIC USE RESTRICTIONS section of this label.

Doseage
Northestern States (Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Rhode Island, and Vermont)
End Zone herbicide is recommended for postemergence control at 2 to 4 fluid ounces (0.03 to 0.06 lb. active) per acre when applied postemergence to seeded onions that have at least three (3) true leaves. Multiple treatments at the aforementioned rate may be applied. Do not apply more than 2 pints (0.5 lb. active) per broadcast acre of End Zone herbicide as a result of multiple applications in one season.

Western States (Arizona, California, Colorado, Idaho, Nevada, New Mexico, Oregon, Texas, Utah, and Washington)
End Zone herbicide is recommended for postemergence control at 0.5 to 1 pint (0.12 to 0.25 lb. active) per acre when applied postemergence to onions that have at least two (2) true leaves. Multiple treatments at the aforementioned rates may be applied. Do not apply more than 2 pints (0.5 lb. active) per broadcast acre of End Zone herbicide as a result of multiple applications in one season.

For transplanted onions in the northeastern states, the apply the same rates listed in the DOSAGE-SEEDED ONIONS section within two days after transplanting.

Pre-Transplant: For application to onion transplants, spray as soon before or after transplanting. Do not exceed the maximum use rate of 2 pints (0.5 lb. active) per broadcast acre of End Zone herbicide as a result of multiple applications in one season. Sprinkler Irrigation: For application using sprinkler irrigation (solid set, portable lateral, center pivot, continuous lateral move, side (wheel) roll) systems, apply specified dosage of End Zone per acre as described in this section. Follow all directions given in the supplemental labeling entitled APPLICATION THROUGH IRRIGATION SYSTEMS — CHEMIGATION when making applications using sprinkler irrigation systems.

For transplanted onions in the northeastern states, the apply the same rates listed in the DOSAGE-SEEDED ONIONS section within two days after transplanting.

Pre-Transplant: (Not for use in Northeastern or Western states except as specifically directed on other approved supplemental labeling.) End Zone is recommend- ed for use as a postemergence application to onion transplants at 1 to 2 pints (0.25 to 0.5 lb. active) per broadcast acre. Applications must be made after completion of soil preparation but prior to transplanting of onion plants. Transplanting should be completed with minimal soil disturbance. Treated soil surfaces should be left undisturbed after transplanting to obtain greatest benefit of End Zone herbicide on susceptible annual broadleaf weeds during the time period for which weed control is desired. However, timely cultivations after weed emergence will assist in weed control. If less than 2 pints per acre are applied as a preplant treatment, postemergence applications can be made as instructed in the DOSAGE-SEEDED ONIONS section of this label. Do not exceed the maximum use rate of 2 pints (0.5 lb. active) per broadcast acre of End Zone herbicide as a result of multiple applications in one season.

Dosages listed are for broadcast application. For banded application, the amount of End Zone herbicide used per acre should be reduced according to the following formula:

\[ \text{Band Width (in inches)} \times \text{Rate per Row} \times \text{Broadcast Acre} = \text{Amount Needed per Acre} \]

Weeds Controlled
End Zone herbicide will provide postemergence control of the following weeds when applied at the recommended dosage and leaf stage (2 to 4 leaves):

- Barnyardgrass (Annuat): P punctiforme
- Eveningprimrose, Cutleaf: Euphorbia
- Groundsel, Common: Senecio vulgaris
- Malva, Leaf (Malva): Malva sativa
- Nightshade, Black: Solanum nigrum
- Pigweed, Prostrate: Chenopodium album
- Pigweed, Redroot: Capsella bursa-pastoris
END ZONE HERBICIDE  
EPA REG. NO. 34704-  

a Weeds controlled when applied as a pre-transplant application. In addition, End Zone herbicide at the rate of 1 to 2 pints per acre will control/suppress or kill the following weeds:  
carpetsilkweed, Pennsylvanian smartweed, galingosa, common lambsquarters, and wild mustard. Applications of End Zone herbicide to muck soils may result in partial control or suppression of the weeds listed.  
b Specific weeds controlled at rates recommended for use in Northeastern states (see DOSAGE section).  

Timing and Method of Application  
For best postemergence control of susceptible weeds, apply when the weeds are in the 2- to 4-leaf stage. Application of End Zone herbicide after the weeds exceed the maximum leaf stage may result in reduced weed control. More than one postemergence application may be necessary to control subsequent weed flushes.  

End Zone herbicide should be thoroughly mixed with clean water at recommended concentration and applied in a minimum of 40 gallons of water per acre. Use conventional ground spray equipment with flat fan spray nozzles at 20 to 40 psi. Accurately calibrate spray equipment prior to each use. Avoid drift to all other crops and nontarget areas. Thoroughly flush the spray equipment (tank, hose, pump, boom) with water before and after each use. Residual End Zone herbicide remaining in the spray equipment may damage other crops.  

Onions  
Specific Use Restrictions  
In addition to the following, also observe GENERAL USE RESTRICTIONS listed at the end of this label.  

• In all states except Northeastern states, do not start spraying until the onions (direct-seeded) have two (2) fully developed true leaves. In the Northeastern states (Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Rhode Island, Vermont), do not start spraying until the onions (direct-seeded) have three (3) fully developed true leaves. Applications made prior to the recommended onion development stage may result in serious injury and are not recommended.  
• Do not apply more than a total of 2 pints (0.5 lb. active) per acre of End Zone herbicide during one use season.  
• Do not apply within 45 days of harvest.  
• Use only on dry bulb onions.  
• Do not apply to onions grown for seed except as specified below or on other approved supplemental labeling.  
• Tank mixtures of End Zone herbicide with oils, surfactants, liquid fertilizers, or other pesticides may result in enhanced crop response/injury and are the responsibility of the user.  
• Do not apply End Zone herbicide preemergence to direct-seeded onions.  
• Do not apply to onion plants that are under stress due to drought, flooding, excessive fertilizer or sol salts, storage conditions, wind injury, hail, frost damage, injury from previously applied pesticides, or injury due to insects, nematodes, or diseases.  

ONIONS GROWN FOR SEED  
General Information  
End Zone is a selective herbicide for postemergence application to onions grown for seed for early postemergence control of certain annual broadleaf and grassy weeds.  

Initial spray application should be made only when the onions have reached the development stage specified in the DOSAGE section and the SPECIFIC USE RESTRICTIONS section of this label. End Zone herbicide can cause nematicid lesions, twisting, pitting, or stunting of the onion plants. Injury will be more severe if applications are made immediately following or during cool, wet weather and/or if applications are made prior to the development stage of the onion plant as specified in the DOSAGE section and the SPECIFIC USE RESTRICTIONS section of this label.  

Note: Some varieties or inbred lines of onions may be more susceptible to End Zone herbicide. Care should be taken to insure that the particular onion variety or line being grown is tolerant to End Zone herbicide. It is suggested that all onion varieties or lines be tested in limited areas to ensure an adequate level of crop tolerance prior to an application for postemergence weed control.  

Weeds Controlled  
End Zone herbicide will provide postemergence control of the following weeds when applied at the recommended dosage and leaf stage (2 to 4 leaves):  

• Canopygrass (Annual) Puncturevine  
• Evening primrose, Culleaf  
• Groundsel, Common  
• Mallow, Little (Malva)  
• Nighshade, Black  
• Pigweed, Prostrate  
• Pigweed, Redroot  

*Specified weeds controlled at rates recommended for use in Northeastern states (see DOSAGE section).  

DOSAGE  
Northeastern States (Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Rhode Island, And Vermont)  

End Zone herbicide is recommended for postemergence control at a maximum use rate of 2 fluid ounces (0.03 lb. active) per acre when applied postemergence to seeded onions that have at least four (4) true leaves. Multiple treatments at the aforementioned rate may be applied. Do not apply more than 2 pints (0.5 lb. active) per broadcast acre of End Zone herbicide as a result of multiple applications in one season.  

All Other States  
End Zone herbicide is recommended for postemergence control at a maximum use rate of 0.5 pints (0.125 lb active) per acre when applied postemergence to onions that have at least three (3) true leaves. Multiple treatments at the aforementioned rate may be applied. Do not apply more than 2 pints (0.5 lb active) per broadcast acre of End Zone herbicide in one season.  

Timing And Method Of Application  
For best postemergence control of susceptible weeds, apply when the weeds are in the 2- to 4-leaf stage. Application of End Zone herbicide after the weeds exceed the maximum leaf stage may result in reduced weed control. More than one postemergence application may be necessary to control subsequent weed flushes.  

End Zone herbicide should be thoroughly mixed with clean water at recommended concentrations and applied in a minimum of 40 gallons of water per acre. Use conventional ground spray equipment with flat fan spray nozzles at 20 to 40 psi. Do not exceed 40 psi. Accurately calibrate spray equipment prior to each use. Thoroughly flush the spray equipment (tank, hose, pump, boom) with water before and after each use. Residual End Zone herbicide remaining in the spray equipment may damage other crops.  

Chemigation: For application using sprinkler irrigation (solid set or portable lateral) systems, apply specified dosage of End Zone per acre as described above. Follow all directions given in the supplemental labeling entitled APPLICATION THROUGH IRRIGATION SYSTEMS - CHEMIGATION when making applications using sprinkler irrigation systems.  

Do not apply when weather conditions favor drift. Avoid drift to all nontarget areas. End Zone HERBICIDE IS PHYTOXICO TO PLANT FOIAGE.  

Onions Grown For Seed  
Specific Use Restrictions  
In addition to the following, also observe GENERAL USE RESTRICTIONS listed at the end of this label.  

• In all states, do not start spraying until the onions have reached the minimum leaf stage specified in the DOSAGE section of this label. Applications made prior to the recommended onion development stage may result in serious injury and are not recommended.  
• Do not apply more than a total of 2 pints (0.5 lb. active) per acre of End Zone herbicide during one use season.  
• Do not apply within 60 days of harvest.  
• Do not mix End Zone herbicide with oils, surfactants, liquid fertilizers, or other pesticides except as specified on the GALIANG label.  
• Do not apply to onion plants that are under stress due to drought, flooding, excessive fertilizer or sol salts, wind injury, hail, frost damage, injury from previously applied pesticides, or injury due to insects or diseases.  

PAPAYA  
For Use Only In Hawaii  
General Information  
End Zone is a selective herbicide for use as a post-directed application for broadcast weed control in papaya. Occasionally, after the use of End Zone herbicide, a spotting, crinkling, or flecking may appear on the leaves of the papaya. Leaves or green stalks that receive direct or indirect (drift) spray contact will be injured.  

Do not use End Zone herbicide on papaya plantings that are weak or under stress due to temperature, disease, fertilizer, nematodes, insects, pesticides, drought, or excessive moisture.  

Dosage and Timing  
Apply End Zone herbicide at a rate of 4 pints (1.0 lb. active) per broadcast acre as a directed spray to the orchard floor. The initial application should occur no earlier than 4 months after transplanting or 6 months after direct seeding, and after the papaya has reached a minimum height of 4 feet. Applications may be repeated at approximate 4-month intervals.  

End Zone herbicide provides effective control of susceptible weed seedlings in the 4-leaf stage. Do not apply more than 4 pints (1.0 lb. active) of End Zone per broadcast acre in a single application or more than 12.0 pints (3.0 lbs. active) per broadcast acre per year as a result of multiple applications.  

Weeds Controlled  
End Zone herbicide will provide preemergence and postemergence control of the following weeds when used at the recommended dosage. Application to weeds beyond the 4-leaf stage may result in partial control:  

• Amaenum, Spiny  
• Spurge, Garden  
• Purshane, Common  

Method Of Application  
End Zone herbicide should be thoroughly mixed with clean water at recommended concentrations and applied in a minimum of 15 gallons of water per broadcast acre. Accurately calibrate spray equipment prior to each use.  

Accurate, uniform placement of End Zone herbicide is essential for effective weed control and to minimize crop injury. End Zone must be applied as a directed spray to the orchard floor beneath the papaya plants. Do not allow the herbicide to enter ditches, streams, irrigation systems, or irrigation man made contact with green bark, stems, fruit, or foliage as injury may result. End Zone herbicide must be applied using rigid precision ground sprayer equipment.  

Papaya  
Specific Use Restrictions  
In addition to the following, also observe GENERAL USE RESTRICTIONS listed at the end of this label.  

END ZONE HERBICIDE
EPA REG. NO. 34704-

- Do not allow herbicide solution, spray, drift, or mist to contact green bark, stems, fruit, or foliage as injury may result.
- Do not apply more than 4.0 pints (1.0 lb. active) of End Zone herbicide per broadcast acre in a single directed spray or more than 12 pints (3.0 lb. active) per broadcast acre per year as a result of multiple applications.
- Do not apply End Zone herbicide within 1 day of harvest.
- For use only on papaya grown in Hawaii.

SOYBEANS
Not For Use In California

General Information
End Zone is effective as a preemergence and postemergence (post-directed) herbicide for the control of broadleaf weeds in soybeans. Applications can be made early preplant in conservation tillage soybeans, preemergence in no-till (double-crop) and conventional till soybeans, or postemergence in conventional till soybeans. Seeding weeds are controlled as they come in contact with the herbicide either during emergence or through a post-directed application. Follow specific use directions and restrictions for recommended use and timing of applications.

Soybeans are tolerant to preemergence and post-directed applications of recommended dosages of End Zone herbicide; however, under certain conditions, End Zone herbicide can cause temporary injury. Heavy splashing rain shortly after crop emergence or cold, wet soil conditions during early growth stages can produce leaf cupping and curling. When injury occurs, it is generally limited to the first few leaves that develop shortly after crop plants emerge from the soil. Soybeans recover from this injury and yield losses are not adversely affected. Soybean leaves that are accidentally sprayed during a post-directed application will exhibit necrotic spotting and injury to the soybean leaves. Therefore, care must be exercised to avoid spray contact with the soybean leaves.

Dosage And Timing
Conservation Tillage
Soybeans Early Preplant
End Zone herbicide is effective for preemergence and postemergence control of susceptible broadleaf weeds when applied at 1.5 to 3 pints (0.30 to 0.75 lb. active) per broadcast acre to the stale seedbed prior to the planting of conservation tillage beans. When injury occurs, it is generally limited to the first few leaves that develop shortly after crop plants emerge from the soil. Soybeans recover from this injury and yield losses are not adversely affected. Soybean leaves that are accidentally sprayed during a post-directed application will exhibit necrotic spotting and injury to the soybean leaves. Therefore, care must be exercised to avoid spray contact with the soybean leaves.

No-Till (Double-Crop) Soybeans
Preemergence
End Zone herbicide is effective for preemergence and postemergence control of susceptible broadleaf weeds when applied at 0.5 to 2 pints (0.12 to 0.9 lb. active) per broadcast acre. For postemergence control of certain grassy and broadleaf weeds, a tank mix of either paraquat (Gramoxone) or glyphosate (Roundup) with End Zone herbicide can be used. For residual grass control in no-tillage soybeans, a tank mixture of Bronco®, Dual, Lasso, or Surflan with End Zone herbicide or combinations of End Zone herbicide plus paraquat (Gramoxone) or glyphosate (Roundup) can be used. Follow specific use directions and restrictions for these combination tank mixes. Application should be made within one day after planting. Late applications may result in severe crop injury and are not recommended.

Weeds Controlled Preemergence
End Zone herbicide used alone at recommended dosages provides preemergence control of the following broadleaf weeds:

- Groundcherry, Cutleaf
- Persicaria, Wild
- Nightshade, American Black
- Nightshade, Black
- Shepherdspurse
- Sida, Prickly (Teaweed)
- Smartweed, Pennsylvania
- Sowthistle, Common
- Velvetleaf
- Pigweed, Redroot
- Smartweed, Pennsylvania
- Sida, Prickly (Teaweed)
- Velvetleaf
- *Multiple applications may be required for acceptable control.
- **Post-directed applications of End Zone herbicide will kill or suppress seedlings not exceeding the one true leaf stage.

Tank Mixes With End Zone Herbicide
End Zone herbicide when applied at 0.5 to 0.8 pint (0.16 to 0.2 lb. active) per acre as a tank mix with metribuzin (Sencor® DF or Lasso® DF) at 0.33 lb. product (0.25 lb. active) per acre is effective for preemergence control of susceptible broadleaf weeds. Do not apply this tank mix to sandy soils or coarse soils (sandy loam or loamy sand) containing less than 2% organic matter. Do not use on soils with less than 15% organic matter or on alkaline soils with a pH above 7.4 as crop injury may occur. Application should be made within one day following planting. Late applications may result in severe crop injury and are not recommended. The End Zone/metribuzine herbicide tank mix may be applied as a preemergence application following a preplant incorporated grass herbicide treatment or as a three-way tank mix in a preemergence application with either Dual, Lasso, or Surflan.

Important: Read and observe all label directions before using. When tank mixing, always read all individual manufacturers' labels. In interpreting all labels for the tank mixture, the most restrictive situations must apply.

Dosage
Refer to the following tables for labeled use rates.

No-Till (Double-Crop) Soybeans

* Use the higher rate of Bronco, Dual, or Lasso on soils containing more than 3% organic matter.
** When using Surfkan 75 WP, multiply pints by 0.67 to obtain the amount of Surfkan 75 WP product required. Do not use Surfkan on soils containing more than 5% organic matter.
*** Do not use.

Conventional Tilled Soybeans
Preemergence
End Zone herbicide is effective for preemergence control of susceptible broadleaf weeds when applied at 1 to 1.5 pints (0.25 to 0.38 lb. active) per broadcast acre. Application should be made within one day of planting. Late applications may result in severe crop injury and are not recommended. The higher rate (0.38 lb. active) will assist in early season annual grass control. However, End Zone herbicide must not be a basic portion of the grass herbicide program. End Zone herbicide may be applied alone as a preemergence application following a preplant incorporated grass herbicide treatment or as a tank mix in a preemergence application with Dual, Lasso, or Surflan.

END ZONE HERBICIDE
EPA REG. NO. 34704-

Weeds Controlled Preemergence
When End Zone herbicide is tank mixed with Bronco, Dual, Lasso, or Surflan and applied preemergence, in addition to the weeds controlled preemergence by End Zone herbicide alone, control of the following weeds is also obtained:
- Barnyardgrass
- Crabgrass, Large
- Foxtail, Giant
- Foxtail, Yellow

Weeds Controlled Postemergence
When End Zone herbicide is tank mixed with Bronco, paspaturae (Gramoxone), or glyphosate (Roundup) and applied postemergence, in addition to the weeds controlled postemergence by End Zone herbicide alone, control of the following weeds is also obtained:
- Bluegrass, Annual
- Crabgrass, Large
- Foxtail, Giant
- Foxtail, Green

Timing And Method Of Application
As a preemergence treatment, apply in 20 to 60 gallons of water per acre. If Bronco or glyphosate (Roundup) are included in the tank mix, apply in 20 to 40 gallons of water per acre. To insure complete coverage, spray volume should be increased as the density of emerged weeds, crop residue, or stubble increases. Use conventional spray equipment with flat fan or flat jet nozzles. Spray equipment should be calibrated carefully before each use.

Post-Directed Spray
End Zone Herbicide Used Alone
Dosage
End Zone herbicide is recommended as a post-directed application at 1 pint (0.25 lb. active) per acre. Optimum control is achieved when End Zone Herbicide is applied to seedling weeds not exceeding 4 true leaves. See MIXING DIRECTIONS for surfactant recommendations. Weeds should be in the seedling stage, young and actively growing. Do not count cotyledon leaves.

Tank Mixes With End Zone Herbicide
For improved broadleaf weed control, a tank mixture of End Zone herbicide plus Butanox® or Butynox® 200 is suggested. Use 1 pint End Zone Herbicide (0.25 lb. active) with 1 pint of Butonox (0.22 lb. active) or 0.7 to 0.9 pint of Butynox (0.175 to 0.22 lb. active) per broadcast acre. See MIXING DIRECTIONS for surfactant recommendations. When tank mixing, always read all individual manufacturers’ labels. In interpreting all labels for the tank mixture, the most restrictive circumstances must apply.

Timing
Soybeans plant height must be a minimum of 8 inches or greater. Use branch lifters or shields if excessive spray contact to the soybean plant cannot be avoided.

Method Of Application
Accurate, uniform placement of End Zone herbicide spray is essential for effective weed control and to minimize soybean injury. As a directed postemergence application, End Zone herbicide should be applied at 20 to 25 psi using 20 to 40 gallons of spray on a broadcast basis. Do not exceed 25 psi. Spray should be directed towards the base of the soybean plant. Soybean tillage receiving accidental spray or drift may be injured. Weeds should be in the seedling stage, young and actively growing.

End Zone herbicide can be applied using a post-directed spray rig with only 2 flat fan nozzles per row, 1 nozzle on each side of the row. Additional care should be taken when adjusting the sprayer prior to application. For best coverage, it is suggested to use 4 flat fan nozzles per row, 2 nozzles on each side of the row. The 2 forward nozzles should point forward and downward while the rear nozzles should point to the rear and downward. With either sprayer system, nozzles should be adjusted to cover the weed foliage with minimum contact to the soybean plant. Do not use cone nozzles.

Tank Mixture of End Zone Herbicide with Command®
Soybeans (Not For Use In California)
End Zone herbicide when applied preemergence at 0.6 to 0.8 pint (0.16 to 0.2 lb. active) per acre in a tank mix combination with Command® at 0.75 to 1.25 lb. active is effective for the control of susceptible annual grass and broadleaf weeds in soybeans. Application should be made within one day following planting. Later applications may result in severe crop injury and are not recommended.

Weeds Controlled Postemergence
A tank mix of End Zone herbicide with Command® at recommended dosages provides preemergence control of the following weeds:

<table>

For Use In Hawaii Only
General Information
End Zone is a selective herbicide for preemergence and post-directed application to dryland taro for the control of certain broadleaf weeds.

NOTE: Dryland taro is defined as a taro grown without irrigation or by using irrigation practices that do not result in runoff, irrigation return flow, or other loss of irrigation water to the production area. If irrigation is used, the water applied shall not exceed the field capacity of the soil.

Occasionally, after the use of End Zone herbicide, a spotting, crinkling, or flecking may appear on the leaves of the taro. Leaves that receive direct or indirect (drift) spray contact will be injured. Do not use End Zone herbicide on taro plantings that are weak or under stress due to temperature, disease, fertilizer, nematodes, insects, pesticides, drought, or excessive moisture.

Dosage
Apply End Zone herbicide at a rate of 2 pints (0.5 lb. active) per broadcast acre as a single preemergence application within one week after transplanting (and prior to emergence) of the taro. End Zone is also recommended as a post-directed application of 1 pint (0.25 lb. active) per acre at the 1- to 2-leaf stage. Effective control of succulent weed seedlings in the 2- to 3-leaf stage can usually be obtained. Do not apply more than 1 pint (0.25 lb. active) of End Zone per acre in a single post-directed application or more than 2 pints (0.5 lb. active) per broadcast acre per season as a result of multiple post-directed applications.

Dosages listed are for broadcast application. For banded application, the amount of End Zone herbicide used per acre should be reduced according to the following formula:

\[
\text{Band Width (in inches)} \times \frac{\text{Rate per Row Width (in inches)}}{\text{Broadcast Acre for Banded Application}} = \text{Amount Needed per Acre}
\]

Taro Weeds Controlled
End Zone herbicide will provide preemergence and postemergence control of the following weeds when used at the recommended dosages. Applications to weeds beyond the 3-leaf stage may result in partial control:
- Amaranth, Spiny
- Purslane, Common
- Spurge, Garden
- Sida, Prioky

Timing And Method Of Application
End Zone should be thoroughly mixed with clean water at recommended concentrations and applied in a minimum of 15 gallons of water per acre.

When applied preemergence, use conventional ground spray equipment with flat fan nozzles at 20 to 40 psi. Accurately calibrate spray equipment prior to each use.

When applied as a post-directed spray, sprays must be directed to the base of the taro plant. Accurate, uniform placement of End Zone herbicide is essential for effective weed control and to minimize crop injury. Too much coverage received accidental spray or drift will be injured. End Zone herbicide must be applied using rigid precision ground sprayer equipment. As a directed postemergence application, End Zone herbicide should be applied at 20 to 25 psi using 20 to 40 gallons of spray on a broadcast acre basis. Do not exceed 25 psi.

18
END ZONE HERBICIDE  
EPA REG. NO. 34704-  

Toro  

Specific Use Restrictions  

In addition to the following, also observe GENERAL USE RESTRICTIONS listed at the end of this label.  

- Do not apply more than 2 pints (0.5 lb. active) of End Zone herbicide per broadcast acre as a single preemergence application.  
- Do not apply more than 1 pint (0.25 lb. active) of End Zone herbicide per broadcast acre in a single post-emergent spray or more than 2 pints (0.5 lb. active) per broadcast acre per season as a result of multiple post-emergent applications.  
- Do not apply more than 4 pints (1.0 lb. active) of End Zone herbicide per broadcast acre per season as a result of preemergence and post-emergent applications.  
- Do not apply End Zone herbicide within 6 months of harvest of taro (corms, leaves).  
- For use only to dryland taro grown in Hawaii. (Dryland taro is defined as taro grown without irrigation or by using irrigation practices that do not result in run-off, irrigation return flow, or other loss of irrigation water from the production area. If irrigation is used, the water applied shall not exceed the field capacity of the soil).  

TREE FRUITS, NUTS, VINES  

Dormant Application  

Almond, Apple, Apricot, Avocado, Beech Nut, Brazil Nut, Butternut, Cashew, Cherry, Chestnut, Chincapin, Crabapple, Date, Fig, Filbert, Grapes, Hickory Nut, Kiwi, Loquat, Maccadamia Nut, Mayhaw, Nectarine, Olive, Peach, Pear, Pecan, Persimmon, Pistachio, Plum, Pomegranate, Prune, Quince, Walnut  

General Information  

End Zone is effective as a preemergence and/or postemergence herbicide when used alone or in recommended combinations for the control of certain annual broadleaf weeds in certain bearing and nonbearing tree fruit, nut, or vine plantings. The most effective preemergence weed control is achieved when End Zone herbicide is applied to seedling weeds. For postemergence control of certain grassy and broadleaf weeds, a tank mixture of End Zone herbicide with either paraquat (Gramoxone) or glyphosate (Roundup) can be used.  

For preemergence control of susceptible grassy and broadleaf weeds in certain tree fruit, nut, or vine plantings, a tank mixture of End Zone herbicide with naptalamide (Devrinol), diuron (Karmex), prosulfuron (KERR), simazine, nicosulfuron (Soloric), or oryzalin (Surflan) can be applied. Contact herbicides such as paraquat (Gramoxone) or glyphosate (Roundup) may also be added to the tank mixture. Check individual product labels to determine suitability and use rates for various crops.  

End Zone Herbicide Used Alone  

Geographic Use Directions  

Arizona and California  

Dosage  

End Zone herbicide is recommended for postemergence control at 2 to 8 pints (0.5 to 2.0 lbs. active) per broadcast acre. Applications to weeds beyond the 4-inch stage may result in partial control.  

Weeds Controlled Postemergence (weeds up to 4 inches high)  

Apply 2 to 6 pints (0.3 to 2.0 lbs. active) of End Zone herbicide per broadcast acre. Applications to weeds beyond the 4-inch stage may result in partial control.  

Weeds Controlled Preemergence  

Apply 5 to 8 pints (1.25 to 2.0 lbs. active) of End Zone herbicide per broadcast acre. Applications to aerenchymatous weeds not exceeding the 4-inch stage. Applications to aerenchymatous weeds not exceeding the 4-inch stage. Applications to aerenchymatous weeds not exceeding the 4-inch stage may result in partial control.  

Chemigation: For application using sprinkler (low-volume [microsprinkler]), drip (trick-le), and flood (basin) irrigation systems, apply specified dosage of End Zone per acre as described in ARIZONA AND CALIFORNIA - DOSAGE section above. Follow all directions given in the supplemental labeling entitled APPLICATION THROUGH IRIGATION SYSTEMS - CHEMIGATION when making applications using sprinkler irrigation systems. Do not allow treated irrigation water to contact the fruit or foliage.  

All Other States (Except California and Arizona)  

Dosage  

End Zone herbicide is recommended for postemergence control at 2 to 8 pints (0.5 to 2.0 lbs. active) per broadcast acre. For preemergence control of susceptible weeds, use 5 to 8 pints (1.25 to 2.0 lbs. active) per broadcast acre.  

Weeds Controlled Postemergence  

Apply 2 to 8 pints (0.5 to 2.0 lbs. active) of End Zone herbicide per broadcast acre. The lower rate is recommended for the control of susceptible seedling weeds in the early postemergence stage up to the 4-leaf stage. The higher rate (2.0 lbs. active) should be used for weeds up to the 6-leaf stage. Applications to weeds beyond the 6-leaf stage may result in partial control.  

Balsamapple  

Chokebush, Common  

*Cutweed, Narrowleaf  

*Eveningprimrose, Cutleaf

Nightshade, Black  

*Maximum 0.5-inch diameter  

**Highest rate and/or multiple applications may be required for acceptable control. Do not apply more than 8 pints (2.0 lbs. active) per broadcast acre of End Zone herbicide in one season.  

All States  

Timing And Method Of Application  

In Arizona and California, End Zone herbicide can be applied during the period following complete of final harvest up to February 15 (February 1st in Coachella Valley, California). Applications made after the calendar dates above but prior to bud swell may result in significant crop injury and are the responsibility of the user. In California, End Zone herbicide may be applied as an over-the-top or directed spray to dormant non-bearing grape plantings. The use of a low-pressure sprayer is suggested.  

In all states, do not apply End Zone herbicide after buds start to swell until completion of final harvest. Do not apply when fruits or nuts are present. End Zone herbicide can be applied upon completion of final harvest.  

As a preemergence treatment, apply a minimum of 40 gallons of water per acre. Use higher volumes to ensure adequate coverage in high densities of emerged weeds or heavy trash. Best preemergence results are achieved when spray is applied to a relatively weed-free established tilled or soil surface. End Zone herbicide should be directed to the soil and the base of dormant trees or vines. Use a low-pressure sprayer equipped with a breakaway boom and flat fan nozzles. An off-center (OC) nozzle positioned at the end of the boom may be desired. Do not apply to grape plantings that are under stress due to drought, flooding, excessive fertilizer or soil salts, storage conditions, wind injury, hail, injury from previously applied pesticides, or injury due to insects, nematodes, or diseases, as severe crop injury may result. See SPECIFIC USE RESTRICTIONS for End Zone herbicide application on dormant tree or vine plantings.

Tank Mixes With End Zone Herbicide  

Important: Read and observe all label directions before using. When tank mixing, always read all individual manufacturer’s instruction labels. In interpreting all labels for the tank mixture, most the restrictive situations must apply.  

Dosage  

For preemergence control of susceptible grassy and broadleaf weeds in certain bearing and nonbearing tree fruit, nut, or vine plantings, a tank mixture of End Zone herbicide with naptalamide (Devrinol), diuron (Karmex), prosulfuron (KERR), simazine, nicosulfuron (Soloric), or oryzalin (Surflan) can be applied. Apply at the recommended rates and growth stages to susceptible weed species in a manner described on the respective labels.  

For postemergence control of susceptible grassy and broadleaf weeds in certain bearing and nonbearing tree fruit, nut, or vine plantings, a tank mixture of End Zone herbicide plus naptalamide (Devrinol), diuron (Karmex), prosulfuron (KERR), simazine, nicosulfuron (Soloric), or oryzalin (Surflan) with either paraquat (Gramoxone) or glyphosate (Roundup) can be used. Apply at the recommended rates and growth stages to susceptible weed species in a manner described on the respective labels.  

Weeds Controlled  

In addition to the weeds controlled by End Zone herbicide used alone, control of susceptible weeds listed on the respective labels for the following products is also obtained.
END ZONE HERBICIDE
EPA REG. No. 34704-

- diuron (Karmex)
- norflurazon (Solicam)
- promamide (Kerb)
- glyphosate (Roundup)
- paraquat (Gramoxone)

*In addition, simazine provides preemergence control of horseweed (marestail).

Tree Fruits, Nuts, Vines

Dormant Application

Specific Use Restrictions

In addition to the following, also observe GENERAL USE RESTRICTIONS listed at the end of this label.

- Do not apply End Zone herbicide during the period between bud swell and completion of final harvest or when fruit or nuts are present. End Zone herbicide can be applied upon completion of final harvest.
- In Arizona and California, End Zone can be applied during the period following completion of final harvest up to February 15 (February 1st in the Cochella Valley, California). Applications made after the calendar dates above but prior to bud swell may result in significant crop injury and are the responsibility of the user.
- Do not apply more than 6 pints (2.0 lbs. active) per broadcast acre of End Zone herbicide in one season.
- Do not apply to grapes or kiwis established less than 3 years unless vines are on a trellis wire a minimum of 3 feet above the soil surface.
- Do not apply to grapes or kiwis that are not staked or trellised unless vines are free-standing.
- End Zone herbicide or any of the combinations recommended on this label should be applied only to healthy growing trees or vines.
- Direct spray toward the base of trees or vines except in California, End Zone may be applied as an over-the-top application to dormant, nonbearing grape plantings. Otherwise, avoid direct plant contact. Use of a low-pressure sprayer is suggested.

**GRAPES (CALIFORNIA ONLY)**

Non-dormant Application

General Information

End Zone herbicide is a selective herbicide for the control/suppression of susceptible broad leaf weed species in non-dormant grapes (resin and wine grapes only) when applied either as a directed ground spray application or for supplemental preemergence weed control through low-volume sprinkler (microsprinkler) or drip (trickle) irrigation systems. (End Zone herbicide can be applied to all grapes (resin, table, wine) when applied as a dormant application as specified above.) The total amount of End Zone herbicide applied during one season (from completion of final harvest through dormancy to non-dormant use covered by this section) cannot exceed a total of 8 pints (2.0 lbs. a.i.) per acre as a result of multiple applications in any given area (broadcast, banded, or within the wetted area of the low-volume sprinkler or drip irrigation systems).

Crop Tolerance Information

The use of End Zone herbicide may in some instances result in varying degrees of injury to non-dormant grapes. Grape foliage will typically exhibit injury symptoms from direct or indirect (spray drift, soil contact) exposure to End Zone herbicide. This injury may result in leaf necrosis, reddening of the foliage, leaf cupping, or crinkling of the crop. The grape plant continues to grow normally. Immature, expanding leaves at the time of contact with End Zone are the most susceptible to foliage injury. Grapes may exhibit some small blemishes (spots or flicks) to the fruit.

Dosage And Application Timing

End Zone herbicide can be applied as a nondormant application. Applications can be made to nondormant grapes during the period between the completion of bloom up through 14 days prior to harvest.

End Zone herbicide is recommended for use at rates of 1 to 2 pints (0.25 to 0.5 lbs. active) per broadcast acre. Do not apply more than 8 pints (2.0 lbs. active) per broadcast acre per season as a result of multiple applications made during the dormant and non-dormant season (up to 14 days prior to harvest).

Weeds Controlled/Suppressed Postemergence (weeds up to 4 inches high)

For postemergence control/suppression, apply 1 to 2 pints (0.25 to 0.5 lbs. active) per broadcast acre to susceptible weed seedlings up to 4 inches in height. Repeat applications may be required. Applications to weeds beyond this 4-inch stage or at reduced use rates will result in reduced herbicidal activity. For enhanced postemergence activity on certain grassy and broadleaf weeds, a tank mixture of End Zone herbicide with either paraquat (Gramoxone) or glyphosate (Roundup) can be used when applied with ground application equipment.

- Cheeseweed (MaVa)
- Fiddleneck, Coast
- Groundsel, Common
- Herb
- Miner’s Lettuce
- Morningglory Species, Annual
- Mustard, Black

Where postemergence weed activity is desired, add 2 pints of LATRON AG-98 (or comparable 80% active nonionic surfactant cleared for application to growing crops) per each 100 gallons of spray.

Tank Mixtures With End Zone Herbicide

Important: Read and observe all label directions before using. When tank mixing, always read and individual manufacturer’s label. In interpreting all labels for the tank mixture, the most restrictive situation must apply.

For enhanced postemergence activity on a broader spectrum of grassy and broadleaf weeds in the berm or row middles, a tank mixture of End Zone herbicide with either glyphosate (Roundup) or paraquat (Gramoxone) can be used. Apply at the recommended rates and growth stages to susceptible weed species in a manner described on the respective labels.

Weeds Controlled/Suppressed Preemergence

Apply 2 pints (0.5 lbs. active) of End Zone herbicide per broadcast acre. Applications at reduced rates will result in reduced herbicidal activity.

- Burclove
- Cheeseweed (MaVa)
- Fiddleneck, Coast
- Groundsel, Common
- Herb
- Knotweed, Prostrate
- Lambsquarters, Common
- Miner’s Lettuce
- Mustard, Black

Drift: Do not apply to grapes established less than 3 years unless vines are either on a trellis or or drip (trickle) irrigation systems. (End Zone herbicide should be thoroughly mixed with clean water at recommended concentrations and applied in a minimum of 20 gallons of water per acre (10 gallons for Galaxial/glyphosate tank mix). Use higher volumes to ensure adequate coverage in high densities of emerged weeds or heavy trash. Best pre-emergence results are achieved when spray is applied to a relatively weed-free established berm or soil surface.

End Zone herbicide should be directed to the soil and the base of vines. Use a low-pressure sprayer equipped with a breakup boom and fan nozzles. Any diatomaceous earth nozzle positioned at the end of the boom may be desired. Spray equipment should be calibrated carefully before each use. See SPECIFIC USE RESTRICTIONS for End Zone herbicide application on nondormant vine plantings.

Thoroughly flush the spray equipment (tank, hose, pump, boom) with water before and after each use. Residual End Zone herbicide remaining in spray equipment may damage other crops.

AVOID DRIFT TO ALL OTHER CROPS AND NONTARGET AREAS. DO NOT APPLY TO CROPS WHEN WEATHER CONDITIONS FAVOR DRIFT. End Zone HERBICIDE IS PHYTO-TOXIC TO PLANT FOLIAGE.

Chemigation Application: End Zone HERBICIDE may be applied using sprinkler (low-volume sprinkler) and drip (trickle) irrigation systems designed to distribute irrigation water beneath the vine canopy. The application of End Zone herbicide is intended to supplement the preemergence weed control requirements of a broadcast (or directed) weed control program wherein weed emergence is anticipated within the wetted area of a low-volume sprinkler (microsprinkler) or drip (trickle) irrigation system. Applications should be made prior to weed emergence since postemergence activity will be inconsistent due to partial coverage. Apply specified dosage of End Zone per acre as described in DOSAGE AND APPLICATION TIMING section above for non-dormant grapes. Meter End Zone herbicide at a continuous uniform rate during the middle 1/3 of the irrigation period to allow for uniform distribution to the soil surface. For best results, End Zone herbicide should be uniformly positioned across the wetted area to help reduce the RING EFFECT of weed escapes as other products begin to break down around the emitter. Continue irrigation during the final 1/3 of the irrigation period to insure proper flushing of the irrigation system. Follow all directions given in the supplemental labeling entitled APPLICATION THROUGH IRRIGATION SYSTEMS - CHEMIGATION when making applications using sprinkler irrigation systems. Do not treat irrigation water to contact the fruit or foliage.

Grapes

Non-dormant Application-California Only

Specific Use Restrictions

In addition to the following, also observe GENERAL USE RESTRICTIONS listed at the end of this label.

- The total amount of End Zone herbicide applied during one season (from completion of final harvest through dormancy to non-dormant use covered by this section) cannot exceed 8 pints (2.0 lbs. active) per acre as a result of multiple applications in any given area (broadcast, banded, or within the wetted area of the low-volume sprinkler or drip irrigation systems).
- Do not apply within 14 days of harvest.
- Do not apply End Zone herbicide applications in non-dormant grapes until the completion of bloom.
- Do not apply to grapes established less than 3 years unless vines are either on a trellis wire a minimum of 3 feet above the soil surface, or protected by grow tubes. End Zone herbicide should be applied only by ground application equipment or through low-volume sprinkler (microsprinkler) or drip (trickle) irrigation systems as specified above.
- Apply End Zone herbicide as a nondormant application to wine grapes or raisin grapes only.

**GRAPEs (WASHINGTON AND OREGON ONLY)**

Wine And Processing Only

General Information

End Zone herbicide may be used to assist with sucker control in grapes (wine and processed grapes only) when applied as a directed ground spray application to suckers growing from the base of the plant. The use of End Zone herbicide will typically reduce (but not eliminate) the need for sucker removal by hand.
END ZONE HERBICIDE
EPA REG. NO. 34704-

Crop Tolerance
The use of End Zone herbicide may in some instances result in varying degrees of injury to non-target vegetation. Grape foliage will typically exhibit injury symptoms from direct or indirect (spray drift, soil contact) exposure to End Zone herbicide. This injury may result in leaf necrosis, reddening of the foliage, leaf cupping, or crinkling. Immature, expanding leaves at the time of contact with End Zone herbicide are the most susceptible to foliage injury. Grapes may exhibit some small blisters (spots or flecks) to the fruit.

Rate and Application Timing
Apply End Zone herbicide at a rate of 1 to 2 pints (0.25 to 0.5 lbs. active ingredients) per acre in a spray volume of 50 gallons (or more) per broadcast acre to new emerging sucker growth, up to 12 inches in length. The highest rate and/or a second application may be required to achieve an acceptable level of control/suppression of grape suckers. Do not apply more than 8 pints (2.0 lbs. active) per broadcast acre, as a result of multiple applications made during a single season (dormant and nondormant). The use of End Zone herbicide will typically reduce (but not eliminate) the need for sucker removal by hand. Applications can be made to nondormant grapes up to three weeks after bloom. Do not use within 60 days of harvest.

Add 2 pints of Latron AG-98 (or comparable 80 percent active nonionic surfactant cleared for application to growing crops) per each 100 gallons of spray.

Rates indicated above are for broadcast application. For banded applications, the amount of End Zone herbicide used per acre should be reduced according to the following formula:

\[ \text{Band Width (in inches)} \times \text{Rate per} = \text{Amount Needed per Acre} \]
\[ \text{Row Width (in inches)} \times \text{Broadcast Acre} = \text{For Banded Application} \]

Method of Application
End Zone herbicide should be applied in a three-to-five band direction to the base of the grapevines. The bands are to be directed towards the lower portion of the grapevine to minimize leaf injury from spray contact. Avoid spray contact on flowers, grape clusters, or fruit. Mounted nozzles are used to deliver the spray solution. Thorough spray coverage of sucker growth is essential to maximize the activity of End Zone herbicide. Spray equipment should be calibrated carefully before each use.

AVOID DRAFT TO ALL CROPS AND NONTARGET AREAS. DO NOT APPLY WHEN WEATHER CONDITIONS FAVOR DRIFT. End Zone Herbicide is PHYTO-TOXIC TO PLANT FOLIAGE.

Tank Mixtures With End Zone Herbicide
IMPORTANT: Read and observe all label directions before using. When tank mixing, always read all individual manufacturers’ labels. In interpreting all labels for the tank mixture, the most restrictive requirements must apply. For enhanced postemergence sucker control, a tank mixture of End Zone herbicide with either glufosinate (Peyo) or parquat (Gramoxone Extra) can be used. Apply at the recommended rates and growth stages in a manner described on the respective labels.

Weeds Suppressed and/or Controlled
Cheeseweed (Maia) Mustard, Black
Fiddleneck, Coast Nettle, Burdock
Flarees, Broadleaf Pigwee, Redroot
Flairees, Redstem Purslane, Common
Flairees, Whitestem Redmoss
Groundsel, Common Rose, London
Herbit’s Lettuce Southwaste, Annual

Tank Mixtures With End Zone Herbicide
Important: Read and observe all label directions before using. When tank mixing, always read all individual manufacturers’ labels. In interpreting all labels for the tank mixture, the most restrictive instructions must apply.

Dosage
For enhanced postemergence activity on a broader spectrum of grass and broadleaf weeds in the tree row middles, a tank mixture of End Zone herbicide with either glufosinate (Peyo) or paraquat (Roundup) can be used. Apply at the recommended rates and growth stages to susceptible weed species in a manner described on the respective label.

Weeds Suppressed and/or Controlled
Barnyardgrass Barnyardgrass (Manesalt)
Bluegrass, Annual Cornfield Poo, Rocket, London
Chickweed, Common Elytrigia, Italian

Method Of Application
Ground Application: Apply a minimum spray volume of 30 gallons of water per acre (minimum 10 gallons for End Zone glyphosate (Roundup) tank mix). Use higher volumes to achieve adequate coverage in high densities of emerged weeds or heavy trash. Use conventional low-pressure ground spray equipment with flat fan spray nozzles at 20 to 40 psi. An off-center nozzle positioned at the end of the boom may be desired. Spray equipment should be calibrated carefully before each use.

Chemigation Application: Apply this product only through flood (basin) irrigation systems, or low-volume sprinkler (microsprinkler) and drip (trickle) irrigation systems. Applications should be made prior to weed emergence for best control. With low-volume sprinkler (microsprinkler) or drip (trickle) irrigation systems, End Zone herbicide should be continuously metered into the water during the entire irrigation period. Agitation in the pesticide supply tank is desired. Best weed control results are obtained when a uniform distribution and flow of irrigation water is maintained over level land. End Zone herbicide may be applied through low-volume sprinkler (microsprinkler) and drip (trickle) irrigation systems designed to distribute irrigation water beneath the tree canopy. The application of End Zone herbicide is intended to supplement the preemergence weed control requirements of a broadcast (directed) weed control program, where weed emergence is anticipated within the wetted area of the tree canopy. For flood (basin) irrigation systems, End Zone herbicide should be continuously metered into the water during the entire irrigation period. Agitation in the pesticide supply tank is desired. Best weed control results are obtained when a uniform distribution and flow of irrigation water is maintained over level land.

Cultural Considerations For All Applications: To provide maximum effectiveness of preemergence activity of End Zone herbicide, the berm or soil surface should be level, smooth, and free of crop or weed trash (decaying leaves, clippings, dead weeds, etc.). Leaves and trash may be removed by blowing the area to be treated or by thoroughly mixing the trash into the soil through cultivation prior to herbicide applications.

Cultural practices that result in redistribution of disturbance of the soil surface after treatment will decrease the herbicidal effectiveness of End Zone herbicide. Cutting, water furrows or cultivations that mix untreated soil into treated areas will also reduce the effectiveness of the treatment. The best results are from applications to established berms or soil surfaces that are left undisturbed during the time period for which weed control is desired.

Plastichios, Walnuts, Almonds
Non-dormant Application

General information
End Zone herbicide provides effective vegetation management when applied to young broadleaf weed seedlings. For enhanced postemergence activity on certain grassy and broadleaf weeds, a tank mixture of End Zone herbicide with either paraquat (Gramoxone) or glyphosate (Roundup) can be used when applied with ground application equipment.

Dosage
End Zone herbicide is recommended for postemergence suppression at 1 to 2 pints (0.25 to 0.5 lbs. active) per broadcast acre when applied to susceptible weed seedlings less than 4 inches in height. Repeat applications may be required.

For cleanup sprays and preharvest applications for control (postemergence) control, apply End Zone herbicide at 2 to 8 pints (0.5 to 2.0 lbs. active) per broadcast acre to susceptible weed seedlings not exceeding the 4-inch stage. Applications to weed seedlings beyond the 4-inch stage may result in partial control.

For residual (preemergence) control of susceptible weeds, use 5 to 6 pints (1.25 to 2.0 lbs. active) per broadcast acre.
END ZONE HERBICIDE
EPA REG. NO. 34704-

WINDBREAKS AND SHELTERBELTS
(MINNESOTA, NORTH DAKOTA, SOUTH DAKOTA, WYOMING)

General Information
End Zone is effective as a preemergence and/or postemergence herbicide for the con-
trol of certain annual broadleaf weeds in windbreaks and shelterbelts. Preemergence
control is most effective when spray is applied to clean, weed-free soil surfaces. Treated
soil surfaces should not be disturbed as the herbicidal effectiveness of End Zone may
be decreased. Seeding weeds are controlled during emergence as they come in con-
tact with the soil-applied herbicide. The most effective postemergence weed control is
achieved when End Zone herbicide is applied with thorough coverage of weeds in the
seeding stage.

Occasionally after the use of End Zone herbicides, a spotting, crinkling, or flecking may
appear on leaves of deciduous species. Leaves that receive direct or indirect (shift)
spray contact will be injured. Deciduous species typically outgrow this condition rapidly
and develop normally.

Important: Some varieties or cultivars and deciduous species listed may be suscepti-
bile to End Zone. Care should be taken to ensure that the particular variety to be sprayed
with End Zone is tolerant. It is suggested that unfamiliar species be tested in limited
areas prior to application for preemergence and postemergence weed control.

Weeds Controlled
When End Zone herbicide is applied preemergence or postemergence (up to 4 leaf
stage) at recommended dosages, the following broadleaf weeds are controlled:

<table>
<thead>
<tr>
<th>Common Name</th>
<th>Scientific Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mustard, Wild</td>
<td>Trapa natans</td>
</tr>
<tr>
<td>Nettle, Burning</td>
<td>Myriophyllum aquaticum</td>
</tr>
<tr>
<td>Buckwheat, Wild</td>
<td>Fagopyrum esculentum</td>
</tr>
<tr>
<td>Dwarfthistle</td>
<td>Arenaria graeca</td>
</tr>
<tr>
<td>Dock, Curly</td>
<td>Rumex obtusifolius</td>
</tr>
<tr>
<td>Goosefoot, Creeping</td>
<td>Hydrocotyle sibthlitica</td>
</tr>
<tr>
<td>Prostrate</td>
<td>Arctium minus</td>
</tr>
<tr>
<td>Knotweed, Prostrate</td>
<td>Parietaria officinalis</td>
</tr>
<tr>
<td>Kochia</td>
<td>Kochia prostrata</td>
</tr>
<tr>
<td>Ladysthumb</td>
<td>Shepherdspurse sitchensis</td>
</tr>
<tr>
<td>Lambquarters, Common</td>
<td>Smartweed pennsylvanica</td>
</tr>
<tr>
<td>Lettuce, Priky</td>
<td>Sowthistle, Annual</td>

<tr>
<td>Mallow, Little</td>
<td>Tansy mustard</td>
</tr>
<tr>
<td>Mayweed, Triste,</td>
<td>Russian (seedling)</td>
</tr>
<tr>
<td>Mustard, Blue</td>
<td>Velvet leaf</td>
</tr>
<tr>
<td>Tumble</td>
<td></td>
</tr>
</tbody>
</table>

Grasses Controlled
When End Zone herbicide is applied preemergence or postemergence (up to 2 leaf
stage) at recommended dosages, the following annual grasses are controlled:

<table>
<thead>
<tr>
<th>Common Name</th>
<th>Scientific Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Barnyardgrass</td>
<td>Festuca gigante</td>
</tr>
<tr>
<td>Bluegrass Annual</td>
<td>Goose grass</td>
</tr>
<tr>
<td>Crabgrass, Large</td>
<td>Wilt grass</td>
</tr>
</tbody>
</table>

End Zone herbicide is most effective when applied preemergence to annual grasses.
Postemergence applications should be made to seedling grasses not exceeding the 2-
leaf stage. The addition of 0.25% (2 pints per 100 gallons of spray solution) of an 80%
active nonionic surfactant, cleared for application on growing crops, enhances the End
Zone herbicide activity on emerged weeds. When determining an appropriate use rate
where a range of rates is provided, use higher rates where heavy weed pressure is antic-
ipated, or where medium and fine soil textures exist and high organic matter soils are
present.

End Zone herbicide may be applied to conifer and deciduous species including the fol-
lowing:

Dosage
Apply 4 to 8 pints (1.0 to 2.0 lbs. active) of End Zone herbicide per broadcast acre for
preemergence and postemergence weed control. The addition of 0.25% (2 pints per
100 gallons of spray solution) of an 80% active nonionic surfactant cleared for applica-
tion on growing crops enhances the Galigan herbicide safety on emerged weeds.

For banded application, the amount of Galigan to be used per acre should be reduced
according to the following formula.

\[
\text{Row Band (inches)} \times \text{Rate per \text{Band}} = \text{Amount Needed per \text{Acre}}
\]

Method of Application
Conifers: End Zone herbicide can be applied pretransplant, post-directed, or poste-
mergence (over-the-top) to conifers. Postemergence or post-directed applications
should be applied prior to budbreak or after the foliage has had an opportunity to hard-
en off.

Deciduous: End Zone herbicide has exhibited selectivity to many deciduous species
when applied pretransplant or as a post-directed spray prior to budbreak. Special care
should be taken to direct the spray toward the base of the plant. Applications made after
budbreak may result in injury to the deciduous species, and are not recommended.

USE RESTRICTIONS

- Do not apply more than 8 pints (2.0 lbs. active) of End Zone herbicide per treated
acre per growing season as a result of single or multiple applications.
- Always apply End Zone herbicide to healthy deciduous and for conifer species.
- Do not apply End Zone herbicide to oil-bearing or deciduous species that have been
weakened or under stress from excessive fertilizer or soil salts, disease, nematodes, frost,
root damage, flooding, previously applied pesticides, soil insects, or winter injury, as
severe injury may result.

SPECIFIC USE RESTRICTIONS FOR INDIVIDUAL CROPS ARE FOUND UNDER
DIRECTIONS FOR USE IN EACH CROP GROUP SECTION.

Use Restrictions

- Read and observe all label directions before using. When tank mixing, always read
all individual manufacturer's labels. In interpreting all labels for the tank mixture, the
most restrictive situations must apply.

- Do not contaminate irrigation water or water used for domestic purposes.
END ZONE HERBICIDE EPA REG. NO. 34704-

- Do not use any plants treated with End Zone herbicide for feed or forage.
- Do not feed to or allow animals to graze on any treated areas with End Zone herbicide.
- End Zone herbicide should be applied only by ground application equipment except as specifically directed on this label or on other approved supplemental labeling.
- Do not apply when weather conditions favor drift. Avoid drift to all nontarget areas.
- End Zone herbicide is phototoxic to plant foliage.
- Thoroughly flush spray equipment (tank, pump, hoses, and boom) with clean water before and after each use. Residual End Zone herbicide remaining in spray equipment may damage other crops. To assist in the removal of End Zone herbicide residues in spray equipment, a nonionic surfactant such as Latron® AG-98 or Latron CS-7 may be added at the rate of 1 quart per 100 gallons of water during flushing.
- Use End Zone herbicide only for recommended purposes and at recommended rates.
- Do not treat ditch banks or waterways with End Zone herbicide.
- Rotation Crop Restrictions

APPLICATION THROUGH IRRIGATION SYSTEMS - CHEMIGATION

Apply this product only through sprinkler (center pivot, continuous lateral move, side (wheel) roll, solid set, portable lateral, or low-volume (microsprinkler), drip (trickle), or flood (basin) irrigation systems. Refer to the specific crop directions to determine which type of irrigation system to use. Do not apply this product through any other type of irrigation system.

Do not apply this product through any irrigation system unless the instructions for chemigation are followed. If application by chemigation is not specifically listed under the specific crop use instructions, End Zone may not be applied to that crop through an irrigation system.

Crop injury, lack of effectiveness, or illegal pesticide residues in the crop can result from nonuniform distribution of treated water.

If you have questions about calibration, you should contact State Extension Service specialists, equipment manufacturers, or other experts.

Do not connect an irrigation system (including greenhouse systems) used for pesticide application to a public water system unless the pesticide label-prescribed safety devices for public water systems are in place.

A person knowledgeable of the chemigation system and responsible for its operation or under the supervision of the responsible person, shall shut the system down and make necessary adjustments should the need arise.

SPRINKLER CHEMIGATION (FOLIAR SPRAY USES)

For sprinkler irrigation, sufficient water should be applied at the beginning of the irrigation period to ensure uniform wetting of the plant and/or soil surfaces. For solid set or portable lateral sprinkler systems, meter End Zone at a continuous uniform rate during the middle one-third of the irrigation period to allow for uniform distribution to the vegetation and/or soil surface. Continue irrigation during the final one-third of the irrigation period to allow for proper flushing of the irrigation system. For center pivot, continuous lateral move, side (wheel) roll sprinkler systems, meter End Zone at a continuous uniform rate during the entire irrigation period. During sprinkler irrigation, sufficient water should be applied to ensure water penetration to a depth of two inches.

To apply a pesticide using sprinkler chemigation, the chemigation system must meet the following specifications:

- The system must contain a functional check valve, vacuum relief valve, and low-pressure drain properly located on the irrigation pipeline to prevent water source contamination from backflow.
- The pesticide injection pipeline must contain a functional, automatic, quick-closing check valve to prevent the flow of fluid back toward the injection pump.

21
END ZONE HERBICIDE
EPA REG. NO. 34704-
• The pesticide injection pipeline must also contain a functional, normally closed, solenoid-operated valve located on the intake side of the injection pump and connected to the system interlock to prevent fluid from being withdrawn from the supply tank when the irrigation system is either automatically or manually shut down.
• The system must contain functional interlocking controls to automatically shut off the pesticide injection pump when the water pump motor stops.
• The irrigation line or water pump must include a functional pressure switch, which will stop the water pump motor when the water pressure decreases to the point where pesticide distribution is adversely affected.
• Systems must use a metering pump, such as a positive displacement injection pump (e.g., diaphragm pump) effectively designed and constructed of materials that are compatible with pesticides and capable of being fitted with a system interlock.

FLOOD (BASIN) CHEMIGATION (SOIL DRENCH USES)
End Zone herbicide should be continuously metered into the water during the entire irrigation period. Agitation in the pesticide supply tank is suggested. Best weed control results, from End Zone herbicide applied through flood (basin) irrigation systems, are obtained when a uniform distribution and flow of irrigation water is maintained over level land.

Systems using a gravity flow pesticide dispensing system must meter the pesticide into the water at the head of the field and downstream of a hydraulic discontinuity such as drop structure or weir box to decrease potential for water source contamination from backflow if water flow stops. Systems utilizing a pressurized water and pesticide injection system must meet the following requirements:
• The system must contain a functional check valve, vacuum relief valve, and low-pressure drain appropriately located on the irrigation pipeline to prevent water source contamination from backflow.
• The pesticide injection pipeline must contain functional automatic, quick-closing check valve to prevent the flow of fluid backward toward the injection pump.
• The pesticide injection pipeline must also contain a functional, normally closed, solenoid-operated valve located on the intake side of the injection pump and connected to the system interlock to prevent fluid from being withdrawn from the supply tank when the irrigation system is either automatically or manually shut down.
• The system must contain functional interlocking controls to automatically shut off the pesticide injection pump when the water pump motor stops.
• The irrigation line or water pump must include a functional pressure switch, which will stop the water pump motor when the water pressure decreases to the point where pesticide distribution is adversely affected.
• Systems must use a metering pump, such as a positive displacement injection pump (e.g., diaphragm pump) effectively designed and constructed of materials that are compatible with pesticides and capable of being fitted with a system interlock.

CHEMIGATION CALIBRATION FOR LOW-VOLUME SPRINKLERS (MICROSPRINKLERS) AND Drip (TRICKLE) IRRIGATION SYSTEMS
Calculation of use rate is based on wetted area around emitters-NOT ON acet.
To determine correct amount of End Zone herbicide, use the following formula:
1. Treated area = C

Example: If there are 500 emitters per acre, then
C = 500 x 300 = B = 1100.9 square feet wetted per acre
144

2. The area in square feet in each acre = B = A x emitters

Example: If there are 300 emitters per acre, then
B = 300 x 300 = B = 1100.9 square feet wetted per acre
144

3. The total area (in square feet) wet by your system = C

Example: If the system is used on 20 acres, then
C = 1100.9 x 20 = 22,112 square feet wetted by system

4. Amount of End Zone to inject = S

Rate per treated acre of End Zone = R
S = \[ \frac{2}{1} \] x R = quarts of End Zone

Example: If the desired application rate per treated acre is 1 quart of End Zone, then
S = 22112 x 0.1 = S = 0.507 quarts of End Zone should be injected into system

NOTE: Select the proper rate based on weed spectrum and length of control.

CHEMIGATION CALIBRATION FOR FLOOD (BASIN) IRRIGATION SYSTEMS
1. Determine acreage covered by flood irrigation.
2. Determine time required to irrigate area.
3. Fill metering solution tank with water and adjust flow rate to use content over the predetermined time interval required.
4. Determine the amount of End Zone herbicide required to treat area.
5. Add the recommended amount of End Zone herbicide and water (if necessary) to bring solution to the amount required to apply the proper rate for the time interval established during calibration.
6. Meter End Zone herbicide as recommended by label.

CHEMICATION SYSTEMS CONNECTED TO PUBLIC WATER SYSTEMS
If the chemigation system is connected to a public water supply, the following conditions must also be met:
• Public water systems means a system for the provision to the public of piped water for human consumption in an urban sanitary area (land area involving at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days out of the year).
• Chemigation systems connected to public water systems must contain a functional reduced-pressure zone, backflow preventer (RPZ) or the functional equivalent in the water supply line upstream from a point of pesticide introduction. As an option to the RPZ, the water from the public water system should be discharged into a reservoir tank or pesticide injection. There shall be a complete physical break (air gap) between the outlet end of the fill pipe and the top or overflow rim of the reservoir tank at least twice the inside diameter of the fill pipe.
• The pesticide injection pipeline must contain a functional, normally closed, solenoid-operated valve located on the intake side of the injection pump and connected to the system interlock to prevent fluid from being withdrawn from the supply tank when the irrigation system is either automatically or manually shut down.
• The system must contain functional interlocking controls to automatically shut off the pesticide injection pump when the water pump motor stops, or in cases where there is no water pump, when the water pressure decreases to the point where pesticide distribution is adversely affected.
• Systems must use a metering pump, such as a positive displacement injection pump (e.g., diaphragm pump) effectively designed and constructed of materials that are compatible with pesticides and capable of being fitted with a system interlock.
• Upon completion of herbicide application, remove scale, pesticide residues, and other foreign matter from the supply tank and entire irrigation system. Flush thoroughly with clean water.

STORAGE AND DISPOSAL
Do not contaminate water, food, or feed by storage or disposal.
STORAGE: Keep from freezing. Store above 32°F.
PESTICIDE DISPOSAL: Pesticide wastes are toxic. Improper disposal of excess pesticide, spray mixture, or rinse water is a violation of Federal law. If these wastes cannot be disposed of by use according to label instructions, contact your State Pesticide or Environmental Control Agency, or the Hazardous Waste representative at the nearest EPA regional office for guidance.
CONTAINER DISPOSAL: Triple rinse (or equivalent). Then offer for recycling or reconditioning, or puncture and dispose of in a sanitary landfill, or by incineration, or if allowed by State and local authorities, by burning. If burned, stay out of smoke.
STEPS TO BE TAKEN IN CASE MATERIAL IS RELEASED OR SPILLED: Ventilate area. Avoid breathing vapor. Use SHAVAN/GOG self-contained breathing apparatus, air-line respirator for large scale spills in confined areas. Discard the spill with inert material (sand, earth, etc) and transfer the liquid or solid diking material to separate containers for recovery or disposal. Remove the contaminated clothing promptly and wash exposed skin areas with soap and water. Wash clothing before reuse. Keep spill out of all sewers and bodies of water. For help with any spill, leak, fire or exposure involving this material, call day or night CHEMTREC - 1-800-424-9300.
