Olive Knot (*Pseudomonas savastanoi*)

Olive

Pre-treatment Preparation: Remove soil from around underground galls by hosing away with water, or by other means; allow to dry 1 or more days before treatment. Cut off the major portion of all galls larger than a baseball.

Application: Shake well before using. DO NOT DILUTE

Paint gall and cut surfaces plus 1/4 inch of the surrounding healthy bark. Allow treated galls below ground level to dry 1 or more days before replacing soil. Examine after 4 to 6 months and re-treat if any live galls are found.

Time of Application: Make first application before breaking of dormancy or during the spring and early summer. Generally one application will give control. Retreatment may be necessary.

Compatibility: Do not mix or combine GALLEX with other pesticides.
Precaution: Complete girdling of the trunk by galls affects the water-conducting capacity of the tree. To prevent sudden loss of water movement, do not treat more than half of the galled trunk at any one time. Treat the remaining diseased tissue 4 to 6 months later when examination of initial treatment is made.
