SEP 1 1 2009

Application for Pesticide Notification (PRN 98-10) Request General Label Changes: Advisory Statements and Directions for Use (Comply with California DPR Label Review) EPA Reg. No. 42750-199 Application Dated August 6, 2009

Dear Registrant:

SUBJECT:

The Agency is in receipt of your Application for Pesticide Notification under Pesticide Registration Notice (PRN) 98-10 dated 08/06/09 for the above product. The Registration Division (RD) has conducted a review of this request for its applicability under PRN 98-10 and finds that the action(s) requested fall within the scope of PRN 98-10. The label submitted with the application has been stamped "Notification" and will be placed in our records.

If you have any questions, please call me directly at 703-305-6249 or Owen F. Beeder of my staff at 703-308-8899.

Sincerely,

Linda Arrington Notifications & Minor Formulations Team Leader Registration Division.(7505P) Office of Pesticide Programs

Document Processing Desk (NOTIFY) Ms. Joanne Miller (PM 23) Registration Division (7504P) Office of Pesticide Programs U.S. Environmental Protection Agency One Potomac Yard (South Bldg) 2777 South Crystal Dr. Arlington, VA 22202

RE: Oxyfluorfen 4SC EPA Reg. No. 42750-199

Dear Ms. Miller,

The enclosed submission for the above referenced registration is a label notification under PR Notice 98-10 to correct various typos and add other advisory statements in response to comments from California DPR label review. These requested changes align Albaugh's label with the current Dow GoalTender label.

Changes made are as follows:

- Page 8 Changed Spotted spurge footnote to pre-emergence control only
- Page 32 Added "Maximum total application rate per year is 1.5 lb ai per acre" to Garbanzo Bean Restrictions
- Page 34 Replaced Dow AgroScience with Albaugh, Inc.
- Page 41 Replaced Dow AgroScience with Albaugh, Inc.
- Page 43 Replaced Dow AgroScience with Albaugh, Inc.
- Page 48 Added "Maximum total application rate per year is 1.5 lb ai per acre" to Tree Fruit/Nut/Vine Crops Restrictions
- Page 50 Added "Maximum total application rate per year is 1.5 lb ai per acre" to Pistachios, Walnuts Almonds Restrictions

Please call if you have any questions.

Regards,

Morris Gaskins Registrations Manager Albaugh, Inc.

PRECAUTIONARY STATEMENTS

Prolonged or frequently repeated skin contact may cause allergic reactions in some individuals. Avoid contact with skin or clothing. Wash thoroughly with soap and water after handling.

PERSONAL PROTECTIVE EQUIPMENT (PPE)

Some materials that are chemical-resistant to this product are listed below. If you want more options, follow the instructions for category A on an EPA chemical resistance category selection chart.

Mixers, loaders and applicators using engineering controls (see Engineering Controls requirements below) must wear:

- 1. Long-sleeved shirt and long pants
- 2. Shoes plus socks
- Chemical-resistant gloves such as Nitrile, Butyl, Neoprene, and/or Barrier Laminate) when mixing and loading
- 4. Chemical-resistant apron when mixing and loading

All other mixers, loaders, applicators and other handlers must wear:

- 1. Coveralls over long-sleeved shirt and long pants
- 2. Chemical-resistant footwear plus socks
- 3. Chemical-resistant gloves (such as , Neoprene, and/or Barrier Laminate).
- 4. Protective eyewear (goggles or face shield)
- 5. Chemical-resistant headgear for overhead exposure
- 6. Chemical-resistant apron when exposed to the product concentrate

Discard clothing and other absorbent materials that have been drenched or heavily contaminated with this product's concentrate. Do not reuse them. Follow manufacturer's instructions for cleaning/ maintaining PPE. If no such instructions for washables, use detergent and hot water. Keep and wash PPE separately from other laundry.

ENGINEERING CONTROLS.

Mixers and loaders supporting aerial applications to fallow land or ground applications to corn, cotton, or soybeans must use a closed system that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides [40 CFR 170.240(d)(4)], and must:

- Wear the personal protective equipment required above for mixers/loaders using engineering-controls.
- Wear protective eyewear if the system operates under pressure, and
- Be provided and have immediately available for use in case of emergency, such as a broken package, spill, or equipment breakdown, coveralls and chemical-resistant footwear.

Handlers performing applications to corn must use an enclosed cab that meets the definition in the Worker Protection Standard for agricultural pesticides [40 CFR 170.240(d)(5)] for dermal protection, in addition, such applicators must:

- Wear the personal protective equipment required above for applicators using engineering controls
- Be provided and must have immediately available for use in an emergency when they must exit the cab in the treated area: coveralls, chemical-resistant gloves, chemical-resistant footwear, and chemical-resistant headgear, if overhead exposure.

- Take off any PPE that was worn in the treated area before reentering the cab, and
- Store all such PPE in a chemical-resistant container, such as a plastic bag, to prevent contamination
 of the inside of the cab.

Pilots must use an enclosed cockpit in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides [40 CFR 170.240(d)(6).

When handlers use closed systems or enclosed cabs in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides [40 CFR 170.240(d)(4-6)], the handler PPE requirements may be reduced or modified as specified in the WPS.

USER SAFETY RECOMMENDATIONS

Users should:

- 1. Wash hands before eating, drinking, chewing gum, using tobacco or using the toilet.
- 2. Remove-contaminated clothing/PPE immediately if pesticide gets inside. Then wash thoroughly and put on clean clothing.
- 3. Remove PPE immediately after handling this product. Wash the outside of gloves before removing. As soon as possible, wash thoroughly and change into clean clothing.

ENVIRONMENTAL HAZARDS

This product is toxic to aquatic invertebrates and organisms. Do not apply directly to water, to areas where surface water is present or to intertidal areas below the mean high water mark. Runoff from treated areas may be hazardous to aquatic organisms in neighboring areas. See Directions for Use for additional restrictions. Do not contaminate water when disposing of equipment wash water.

DIRECTIONS FOR USE

It is a violation of Federal law to use this product in a manner inconsistent with its labeling. Read all Directions for Use carefully before applying.

Do not apply this product in a way that will contact workers or other persons, either directly or through drift. Only protected handlers may be in the area during application. For any requirements specific to your state or tribe, consult the agency responsible for pesticide regulation.

AGRICULTURAL USE REQUIREMENTS

Use this product only in accordance with its labeling and with the Worker Protection Standard, 40 CFR part 170. This Standard contains requirements for the protection of agricultural workers on farms, forests, nurseries, and greenhouses, and handlers of agricultural pesticides. It contains requirements for training, decontamination, notification, and emergency assistance. It also contains specific instructions and exceptions pertaining to the statements on this label about personal protective equipment (PPE) and restricted-entry interval. The requirements in this box only apply to uses of this product that are covered by the Worker Protection Standard.

Do not enter or allow worker entry into treated areas during the restricted entry interval (REI) of 24 hours, except for the following:

- Onions, garlic and horseradish: The REI is 48 hours
- Conifer seedlings: The REI is 3 days
- Conifer trees: The REI is 6 days

PPE required for early entry to treated areas that is permitted under the Worker Protection Standard and that involves contact with anything that has been treated, such as plants, soil or water, is: 1. Coveralls Chemical-resistant gloves made of any waterproof material
 Shoes plus socks

NON-AGRICULTURAL USE REQUIREMENTS

The requirements in this box apply to uses of this product that are not within the scope of the Worker. Protection Standard for agricultural pesticides (40 CER Part 170). The WPS applies when this product is used to produce agricultural plants on farms, forests, nurseries or greenhouses.

Do not enter or allow others to enter until sprays have dried.

STORAGE AND DISPOSAL: Do not contaminated water, food or feed by storage or disposal

PESTICIDE STORAGE: Keep from Freezing. Store above 32°F

PESTICIDE DISPOSAL: Pesticide Wastes are toxic. Improper disposal of excess pesticide spray mixture or rinsate is a violation of Federal Law. If these wastes cannot be disposed of by use according to label instructions, contact your State Pesticide or Environmental Control Agency, or the Hazardous Waste representative at the nearest EPA Regional Office for guidance.

CONTAINER DISPOSAL: Non-refillable containers (1, 2.5, 30 & 55 gallon): Do not reuse or refill this container. Offer for recycling, if available. Triple rinse or pressure rinse container (or equivalent) promptly after emptying.

(non-refillable <5 gallons): Triple rinse as follows: Empty the remaining contents into application equipment or a mix tank and drain for 10 seconds after the flow begins to drip. Fill the container ¼ full with water and recap. Shake for 10 seconds. Pour rinsate into application equipment or a mix tank or store rinsate for later use or disposal. Drain for 10 seconds after the flow begins to drip. Repeat this procedure two more times.

(non-refillable >5 gallons): Triple rinse as follows: Empty the remaining contents into application equipment or a mix tank. Fill the container ¼ full with water. Replace and tighten closures. Tip container on its side and roll it back and forth, ensuring at least one complete revolution, for 30 seconds. Stand the container on its end and tip it back and forth several times. Turn the container over onto its other end and tip it back and forth several times. Turn the container over onto its other end and tip it back and forth several times. Turn the container over onto its other end and tip it back and forth several times. Empty the rinsate into application equipment or a mix tank or store rinsate for later use or disposal. Repeat this procedure two more times.

Pressure rinse as follows: Empty the remaining contents into application equipment or a mix tank and continue to drain for 10 seconds after the flow begins to drip. Hold container upside down over application equipment or mix tank or collect rinsate for later use for disposal. Insert pressure rinsing nozzle in the side of the container, and rinse at about 40 PSI for at least 30 seconds. Drain for 10 seconds after the flow begins to drip.

Refillable container (250 gallon & bulk): Refill this container with pesticide only. Do not reuse this container for any other purpose. Cleaning the container before final disposal is the responsibility of the person disposing of the container. Cleaning before refilling is the responsibility of the refiller.

Steps to be Taken In Case Material Is Released or Spilled: Ventilate area. Avoid breathing vapors. Use MSHA/NIOSH self-contained breathing apparatus or airline respirator for large spills in confined areas. Dike the spill with inert material (sand, earth, etc.) and transfer the liquid or solid diking material to separate containers for recovery or disposal. Remove contaminated clothing promptly and wash exposed skin areas with soap and water. Wash clothing before reuse. Keep spill out of all sewers and bodies of

water.

GENERAL USE INFORMATION

OXYFLUORFEN 4SC herbicide is a selective herbicide for postemergence and preemergence residual weed control in labeled crops. Directions provided in the General Use Information section of this label apply to all uses of this product. Use directions for listed crops are provided in the Crop-Specific Use Directions section of this label.

USE RESTRICTIONS.

The following use restrictions apply to all labeled uses of OXYFLUORFEN 4SC (Refer to directions for use for individual crops for additional crop-specific use restrictions.):

- Do not graze or harvest plants from areas treated with OXYFLUORFEN 4SC for feed or forage.
- Apply OXYFLUORFEN 4SC only with ground equipment unless otherwise specified in crop-specific use directions.
- OXYFLUORFEN 4SC is phytotoxic to plant foliage. Avoid accidental spray contact or drift with established crops. Do not apply when weather conditions favor drift to non-target areas.
- Some labeled crops are tolerant to over-the-top applications of OXYFLUORFEN 4SC if applied during dormancy. Do not make over-the-top applications unless specifically allowed in crop-specific use directions.
- Do not treat ditch banks or waterways with OXYFLUORFEN 4SC or contaminate water used for irrigation or domestic purposes.
- Do not apply OXYFLUORFEN 4SC in enclosed greenhouses as foliage injury will result.

Spray Drift Buffer Restrictions

- A 25 foot vegetative buffer strip must be maintained between all areas treated with this product and lakes, reservoirs, rivers, permanent streams, marshes or natural ponds, estuaries and commercial fish farm ponds.
- Do not allow spray to drift from the application site and contact people, structures people may occupy at any time and the associated property, parks and reaction areas, non-target crops, aquatic and wetland areas, woodlands, pastures, rangelands, or animals;
- For ground boom applications, apply with nozzle height no more than 4 feet above the ground or crop canopy when wind speed is 10 mph or less at the application site as measured by an anemometer.
- Use coarse spray according to ASAE 572 definition for standard nozzles or VMD of 475 microns for spinning atomizer nozzles.
- The applicator also must use all other measures necessary to control drift.

Rotation Crop Restrictions

- Do not rotate to small-grain crops (includes barley, buckwheat, corn, pearl millet, proso millet, oats, popcorn, rice, rye, sorghum, triticale, wheat, wild rice) within 10 months following an application of OXYFLUORFEN 4SC.
- Do not direct seed any crop, other than a crop labeled for use with OXYFLUORFEN 4SC, within 60 days following application.
- Do not transplant seedlings of crops, other than crops labeled for use with OXYFLUORFEN 4SC, within 30 days following application.
- IMPORTANT: Unless otherwise specified elsewhere in this label or Albaugh supplemental labels or product bulletins, treated soil must be thoroughly mixed to a depth of 4 inches after harvest (or abandoning) of the treated crop but prior to planting of the rotational crop. Failure to achieve

thorough and complete mixing or to follow the required minimum plant-back interval may result in crop injury, stand reduction and/Or vigor reduction of the plant-back crop. See specific fallow bed labeling instructions for required treatment-to-planting intervals following

¹ Highest rate and/or multiple applications may be required for acceptable control. ¹¹ Preemergence control only

APPLICATION METHODS AND RECOMMENDED CULTURAL PRACTICES

Preemergence Weed Control

Apply the recommended rate in a broadcast spray volume of 15 or more gallons of water per acre using calibrated spray equipment capable of uniform application to the soil surface. Seedling weeds are controlled as they come in contact with the soil-applied herbicide during emergence. Preemergence weed control is most effective when OXYFLUORFEN 4SC is applied to soil surfaces that are clean (free of crop or weed residues or clippings) and weed-free. Prior to application, weed or crop residues should be removed by thorough incorporation into the soil using tillage equipment or by blowing the area to be treated. At least 0.25 inch of irrigation or rainfall is required to activate OXYFLUORFEN 4SC and should occur within 3 or 4 weeks after application. For optimum results, OXYFLUORFEN 4SC should be applied to prepared beds or soil surfaces that will be left undisturbed during the time period for which weed control is desired. Cultural practices that disturb or redistribute surface soil following treatment with OXYFLUORFEN 4SC such as cutting water furrows will reduce weed control effectiveness.

Application Rates and Rate Ranges:

Where rate ranges are given, use the lower rate in the rate range on coarse texture soils with less than 1% organic matter and lighter weed infestations. Use higher rates in the rate range on medium to fine texture soils, soils containing greater than 1% organic matter, heavy weed infestations, or for extended residual preemergence weed control.

Postemergence Weed Control

Apply the recommended rate in a broadcast spray volume of 20 or more gallons of water per acre (a minimum 10 gallons if applying OXYFLUORFEN 4SC in tank mix with glyphosate). Because OXYFLUORFEN 4SC is a contact herbicide, complete and uniform coverage of weed foliage is essential for optimum postemergence control. Increase the spray volume to ensure complete and uniform coverage as weedeight and density increases or in the presence of heavy trash (weed or crop residue). Postemergence applications of OXYFLUORFEN 4SC are most effective when made to weeds at the seedling stage. Applications made later than the 4-inch or 4 leaf stage may result in partial control or suppression. Postemergence applications should be made to seedling grasses not exceeding the 2-leaf stage. The addition of 0.25% v/v (2 pints per 100 gallons of spray) of an 80% active nonionic surfactant, labeled for application to growing crops, will enhance herbicidal effectiveness in controlling emerged weeds.

Postemergence Application Rates:

Where a rate range is given, use a higher rate in the rate range for heavy weed infestations, weeds in advanced stages of growth or for extended residual preemergence weed control following control of existing emerged weeds.

Q

GROUND APPLICATION

Ground Broadcast:

Apply OXYFLUORFEN 4SC using conventional low-pressure ground spray equipment with flat fan spray nozzles. Follow manufacturer's recommendation for spraying pressure and boom height. An off-center (OC) nozzle positioned at the end of the boom may be desired. Check calibration of spray equipment before each use.

Directed Sprays:

Apply OXYFLUORFEN 4SC as a coarse low-pressure spray in a spray volume of 20 or more gallons of spray per acre (broadcast basis). Follow manufacturer's recommendations for nozzle spacing and operating pressure. Spray should be directed toward the soil at the base of the crop; in row crops, use a minimum of 2 flat fan nozzles per row (one on each side) and for optimum spray coverage use 4 flat fan nozzles per row (two on each side). The 2 forward nozzles should point forward and downward while the rear nozzles should point to the rear and downward. With either sprayer system, nozzles should be adjusted to cover the weed foliage but minimize contact with the crop. Do not apply with hollow cone nozzles.

IMPORTANT: OXYFLUORFEN 4SC is a contact herbicide. Contact of sprays or drift with foliage or green stems can cause severe crop injury. Use directed sprays and spray shields and/or leaf lifters as necessary to minimize contact of spray or drift with crop foliage or stems. Young green stems of woody plants are also susceptible to injury from spray contact. Potential for injury to woody stems diminishes with loss of green color and the development of relatively impervious non-living corky tissue (bark) on the surface of the stem.

Band Application:

Application rates listed in this label are for broadcast application. For band application, the rate per broadcast acre should be reduced according to the following formula:

Band Width (in inches) X Rate per Row Width (in inches) Broadcast Acre Amount Needed per Acre for Banded Application

Spot Application

For spot application, apply sprays uniformly to soil for preemergence weed control or on a spray-to-wet basis for postemergence weed control. Mix the required amount of OXYFLUORFEN 4SC with the recommended amount of water. For preemergence weed control, use one-half to one gallon of spray per 1000 sq ft. For postemergence weed control use a minimum of 1 gallon of spray per 1000 sq ft and add an 80% nonionic surfactant at the rate of 0.5 fl.oz (1 Tbs) per gallon of spray. If making spot applications within an established crop, use coarse low-pressure sprays and direct the spray to the soil beneath the plants. To avoid crop injury, do not allow spray to contact leaves and stems of herbaceous plants or leaves or green stems of woody plants.

Amount	of OXYFLUORFEN	4SC Required to T	reat 1000 sq ft at	Specified Applic	ation Rate
0,25 pt/acre	0.5 pt/acre	1 .0 pt/acre	1 .5 pt/acre	2.0 pt/acre	4.0 pt/acre
0.1 fl oz	0.2 fl 02	0.4 fl oz	0.55 fl oz	0.75 fl.oz	1 .5 fl oz
(2.75 ml)	(5.5ml)	(11 ml)	(16.5ml)	(22 ml)	(44 ml)

1 pint = 16 fl oz; 1 fl oz = 29.6 (30) ml

Aerial Application

Use aerial boom equipment designed for use with herbicides and a minimum spray volume of 10 gallons per acre (5 gallons per acre if tank mixed with glyphosate). Do not aerially apply OXYFLUORFEN 4SC unless crop-specific use directions specifically allow and provide directions for aerial application.

AVOID DRIFT: Exercise extreme care to avoid herbicide contact with any desirable dormant or nondormant crop, plant, tree or vegetation as severe injury may result Extreme care must be exercised to prevent spray drift that could result in damage to other crops or desirable vegetation. Adhere to the following guidelines when aerial applications are to be made.

Spray Drift Management (Aerial Application):

Avoiding spray drift at the application site is the responsibility of the applicator. The potential for spray drift is controlled by the Interaction of many equipment-and-weather-related factors. The applicator and the grower are responsible for considering all these factors when making decisions. The following drift management requirements must be followed to avoid off-target drift movement from aerial applications to agricultural field crops. These requirements do not apply to forestry applications, public health uses or to applications using dry formulations.

- 1. The distance of the outer most nozzles on the boom must not exceed 34 the length of the wingspan
- or rotor.
- Nozzles must always point backward parallel with the air stream and never be pointed downwards more than 45 degrees.

Where states have more stringent regulations, they should be observed.

The applicator must adhere to the following requirements when OXYFLUORFEN 4SC is aerially applied:

- 1. Do not apply when the wind direction is not stable, when inversion conditions exist, or when wind velocity, exceeds 10 mph.
- When wind speeds are 5 mph or less, maintain a minimum downwind buffer zone of at least 1/2 mile from all crops and desirable vegetation, except the following: Maintain a minimum downwind bufferzone of:
 - 150 feet from dormant treefruit/nut/vine crops and overwintering sugar beets.
 - 650 feet from garlic, jojoba, legumes, onions, pastures, small grains, seedling sugar beets, and non-targeted vegetable fallow beds.
- 3. When wind speeds are between 5 and 10 mph, downwind buffer zones in excess of those listed above are suggested.
- 4. For upwind and side borders; maintain a minimum buffer zone of 150 feet from any non-targeted vegetable fallow bed, crop, or desirable vegetation.

The use of a drift control agent may be required by local regulations. However, the drift control agent may decrease the weed control effectiveness.

Important: Aerial applicators must be familiar with the label for OXYFLUORFEN 4SC and follow all applicable use precautions. Applying OXYFLUORFEN 4SC in a manner other than recommended in this label is done at the user's risk. Users are responsible for all loss or damage resulting from aerial spraying. In addition, aerial applicators should follow all applicable state and local regulations and ordinances. In interpreting the label and local regulations, the most restrictive limitations apply.

Chemigation Instructions

Do not apply this product through any irrigation system unless the instructions for chemigation are

followed. Do not apply OXYFLUORFEN 4SC through chemigation equipment unless chemigation is allowed by Crop-Specific Use Directions.

Apply this product only through sprinkler (center pivot, solid set, portable lateral; or low-volume (microsprinkler)), drip (trickle), or flood (basin) irrigation systems. Refer to use directions for specific crops for instructions as to which type of irrigation system may be used. Do not apply this product through any other type of irrigation system.

- Crop injury, lack of effectiveness, or illegal pesticide residues in the crop can result from nonuniform distribution of treated water.
- If you have questions about calibration, you should contact State Extension Service specialists, equipment manufacturers, or other experts.
- Do not connect an irrigation system (including greenhouse systems) used for pesticide application to a public water system unless the pesticide label-prescribed safety devices for public water systems are in place.
- A person knowledgeable of the chemigation system and responsible for its operation or under the supervision of the responsible person, shall shut the system down and make necessary adjustments should the need arise.

Sprinkler Chemigation (Foliar Spray Uses)

For sprinkler irrigation, sufficient water should be applied at the beginning of the irrigation period to insure uniform wetting of the plant and/or soil surfaces. Meter OXYFLUORFEN 4SC into the sprinkler irrigation system at a continuous uniform rate during the middle 1/3 of the irrigation period to allow for uniform distribution to target weeds and/or soil surface. Continue irrigation during the final 1/3 of the irrigation period to insure proper flushing of the irrigation system. During sprinkler irrigation, sufficient water should be applied to insure water penetration to a depth of two inches.

AVOID DRIFT: Extreme care must be exercised to prevent spray drift that could result in damage to other crops or desirable vegetation. Use the following guidelines when applications of OXYFLUORFEN 4SC are made through sprinkler irrigation equipment:

- 1. Do not apply when the wind direction is not stable, when inversion conditions exist, or when wind velocity exceeds 10 mph.
- When wind speeds are 5 mph or less, maintain a minimum download buffer zone of at least Vz mile from all crops and desirable vegetation, except for the following: Maintain a minimum download buffer zone of:
 - 150 feet from dormant treefruit, dormant vines and overwintering sugar beets.
 - 650 feet from garlic, jojoba, legumes, onions, pastures, small grains, seedling sugar beets and vegetable fallow beds.
- 3. When wind speeds are between 5 and 10 mph, downwind buffer zones in excess of those listed above are suggested.
- 4. For upwind and side borders, maintain a minimum buffer zone of 150 feet from any vegetable fallow bed, crop, or desirable vegetation.

To apply a pesticide using sprinkler chemigation, the chemigation system must meet the following specifications:

- The system must contain a functional check valve, vacuum relief, valve, and low-pressure drain
- appropriately located on the irrigation pipeline to prevent water source contamination from backflow.
- The pesticide injection pipeline must contain a functional, automatic, quick-closing check valve to
- prevent the flow of fluid back toward the injection pump.
- The pesticide injection pipeline must also contain a functional, normally closed, solenoid-operated valve located on the intake side of the injection pump and connected to the system interlock to

prevent fluid from being withdrawn from the supply tank when the irrigation system is either automatically or manually shut down.

- The system must contain functional interlocking controls to automatically shut off the pesticide injection pump when the water pump motor stops.
- The irrigation line or water pump must include a functional pressure switch, which will stop the water pump motor when the water pressure decreases to the point where pesticide distribution is adversely, affected.
- Systems must use a metering pump, suchas a positive displacement injection pump (e.g., diaphragm pump) effectively designed and constructed of materials that are compatible with pesticides and capable of being fitted with a system interlock.
- Do not apply when wind speed favors drift beyond the area intended for treatment.

Flood (Basin) Chemigation (Soil Drench Uses)

OXYFLUORFEN 4SC should be continuously metered into the water during the entire irrigation period. Agitation in the pesticide supply tank is suggested. Best weed control results from OXYFLUORFEN 4SC applied through flood (basin) irrigation systems are obtained when a uniform distribution and flow of irrigation water is maintained over level land.

Systems using a gravity flow pesticide dispensing system must meter the pesticide into the water at the head of the field and downstream of a hydraulic discontinuity such as drop structure or weir box to decrease potential for water source contamination from backflow if water flow stops. Systems utilizing a pressurized water and pesticide injection system must meet the following requirements:

- The system must contain a functional check calve, vacuum relief valve, and low-pressure drain appropriately located on the irrigation pipeline to prevent water source contamination from backflow.
- The pesticide injection pipeline must contain functional automatic, quick-closing check valve to
 prevent the flow of fluid back toward the injection pump.
- The pesticide injection pipeline must also contain a functional, normally closed, solenoid-operated valve located on the intake side of the injection pump and connected to the system interlock to prevent fluid from being withdrawn from the supply tank when the irrigation system is either automatically or manually shutdown:
- The system must contain functional interlocking controls to automatically shut off the pesticide injection pump when the water pump motor stops.
- The irrigation line or water pump must include a functional pressure switch, which will stop the water pump motor when the water pressure decreases to the point where pesticide distribution is adversely affected.
- Systems must use a metering pump, such as a positive displacement injection pump (e.g., diaphragm pump) effectively designed and constructed of materials that are compatible with pesticides and capable of being fitted with a system interlock.

Drip (Trickle) Chemigation (Soll Drench Uses)

To achieve optimum distribution of OXYFLUORFEN 4SC in the soil surface, meter OXYFLUORFEN 4SC at a continuous uniform rate during the middle 1/3 of the irrigation period. For best results, OXYFLUORFEN 4SC should be uniformly distributed across the wetted area to help reduce the "ring effect" of weed escapes. Continue irrigation during the final 1/3 of the irrigation period to insure proper flushing of the irrigation system.

To apply a pesticide using drip (trickle) Chemigation, the Chemigation system must meet the following specifications:

The system must contain a functional check valve, vacuum relief valve and low pressure drain.

appropriately located on the irrigation pipeline to prevent water source contamination from backflow. The pesticide injection pipeline must contain a functional, automatic, quick-closing check valve to prevent the flow of fluid back toward the injection pump.

- The pesticide injection pipeline must also contain a functional, normally closed, solenoid-operated valve located on the intake side of the injection pipe and connected to the system interlock to prevent fluid from being withdrawn from the supply tank when the irrigation system is either automatically or manually shut down.
- The system must contain functional interlocking controls to automatically shut off the pesticide injection pump when the water pump motor stops. The irrigation line or water pump must include a functional pressure switch, which will stop the water pump motor when the water pressure decreases to the point where pesticide distribution is adversely affected.
- Systems must use a metering pump such as a positive displacement injection pump (e.g., diaphragm pump) effectively designed and constructed of materials that are compatible with pesticides and capable of being fitted with a system interlock.

Chemigation Calibration: For Low-Volume Sprinklers (Micro-sprinklers) and Drip (Trickle) irrigation Systems

Calculation of use rate is based on wetted area around emitters - NOT on grove acres. To determine correct amount of OXYFLUORFEN 4SC, use the following formula:

1: Treated area per each emitter = A A = 3.14 x (radius x radius)

> Example: If the average distance from emitter to perimeter of wetted area measured at the soil surface is 13 inches, then $A = 3.14 \times (13" \times 13")$ $A = 3.14 \times (169")$ A = 530.7 square inches

- The area in square feet wet in each acre = B
 B = A X emitters/acre
 144
 - Example: If there are 300 emitters per acre, then $B = 530.7 \times 300 = B = 1105.6$ square feet wetted per acre 144
 - The total area (in square feet) wet by your system = C C \approx B X acres covered by system

Example: If the system covers 20 acres, then C = 1105.6 square feet per acre x 20 acres C = 22,112 square feet wetted by system

Amount of OXYFLUORFEN 4SC to inject = S Rate per treated acre of OXYFLUORFEN 4SC = R S = C X R = pints of OXYFLUORFEN 4SC 43.560

Example: If the desired application rate per treated acre is 1 guart of OXYFLUORFEN 4SC, then $S = 22,112 \times 1.0 = S = 0.507$ pints of OXYFLUORFEN 4SC should be injected into system. 43,560

14

4,

3.

Note: Select the proper rate based on weed spectrum and desired length of control (See Rate Ranges section below).

Chemigation Systems Connected to Public Water Systems

If the Chemigation system is connected to a public water supply, the following conditions must also be met:

- Public water systems means a system for the provision to the public of piped water for human consumption if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days out of the year.
- Chemigation systems connected to public water systems must contain a functional reduced-pressure zone, backflow preventer (RPZ) or the functional equivalent in the water supply line upstream from a point of pesticide introduction. As an option to the RPZ, the water from the public water system should be discharged into a reservoir tank prior to pesticide introduction. There shall be a complete physical break (air gap) between the outlet end of the fill pipe and the top or overflow rim of the reservoir tank of at least twice the inside diameter of the fill pipe.
- The pesticide injection pipeline must contain a functional, normally closed, solenoid-operated valve located on the intake side of the injection pump and connected to the system interlock to prevent fluid from being withdrawn from the supply tank when the irrigation system is either automatically or manually shutdown.
- The system must contain functional interlocking controls to automatically shut off the pesticide injection pump when the water pump motor stops, or in cases where there is no water pump, when the water pressure decreases to the point where pesticide distribution is adversely affected.
- Systems must use a metering pump, such as a positive displacement injection pump (e.g., diaphragm pump) effectively designed and constructed of materials that are compatible with pesticides and capable of being fitted with a system interlock.

MIXING DIRECTIONS

Shake well before use. Fill the spray tank at least one-third full of clean water. With the pump and agitator running, add the recommended amount of herbicides to the spray tank. The order of addition to the spray tank should be (1) wettable powders, (2) flowables and (3) soluble liquids. Complete filling of the spray tank with water.

Use of Surfactants: For all applications of OXYFLUORFEN 4SC where postemergence weed control is desired (except garlic and onions), add a minimum of 2 pints of 80% active nonionic surfactant (cleared for application to growing crops) per each 100 gallons of spray. The addition of 4 pints of nonionic surfactant is recommended to enhance postemergence activity when hard water (greater than 600 ppm) is used. Maintain agitation until spraying is completed.

Tank Mixing Precautions:

- Follow applicable use directions, precautions, and limitations on the respective product labels. In interpreting the labels of tank mixed products, the most restrictive label limitations must apply.
- Do not exceed recommended application rates. Do not tank mix this product with another pesticide that contains the same active ingredient as this product unless the label of either tank mix partner specifies the maximum dosages that may be used.

Tank Mix Compatibility Testing:

A jar test is recommended prior to tank mixing to ensure compatibility of this product and other

pesticides. Use a clear glass quart jar with lid and mix the tank mix ingredients in their relative proportions. Invert the jar containing the mixture several times and observe the mixture for approximately 1/2 hour. If the mixture balls-up, forms flakes, sludges, jels, oily films or layers, or other precipitates, it is not compatible and the tank mix combination should not be used.

Sprayer Clean-up:

Thoroughly flush spray equipment (tank, pump, hoses and boom) with clean water before and after each use. Residues of OXYELUORFEN 4SC remaining in spray equipment may damage other crops. The addition of a non-ionic surfactant to equipment flushing waters at the rate of 1 quart per 100 gallons is recommended to aid in removal of residues of OXYELUORFEN 4SC.

CROP-SPECIFIC USE DIRECTIONS

ARTICHOKE (GLOBE)

Post-l	Dire	cted	Spray	Applic	ations

Weed Control	Rate	Specific Use Directions
Constant and a state of the	(pint/acre)	
Preemergence	2 - 3	Application Method:
		Apply as a directed spray to the soil surface between the
Postemergence		rows and at the base of artichoke plants in a minimum
		spray volume of 40 gallons per acre:
		Timing to Crop:
		Apply after completion of ditching operations. Separate
		applications of up to 2 pint/acre may be made 8 to 10
	الم	weeks apart or a single application of up to 3 pt/acre may
		be made.
		Timing to Weeds: Preemergence up to 8 leaf stage.
Precautions:		

- Do not apply over-the-top. Contact with direct spray or drift will cause injury to artichoke fronds or severe injury to buds or flowers.
- Application of OXYFLUORFEN 4SC to artichoke plantings should be delayed a minimum of 60 days after cutting back or transplanting.

Restrictions:

- Do not apply more than 3 pints of OXYFLUORFEN 4SC per acre per season as a result of a single.
- application or multiple applications.
- Preharvest Interval: Do not apply within 5 days of harvest.

¹OXYFLUORFEN 4SC at the 3 pint/acre will provide control of filaree and other weeds up to 4-inch stage. Applications to weeds beyond the 4-inch stage may result in partial control. ¹¹ Highest rate and/or multiple applications may be required for acceptable control. ¹¹ Maximum 0.5-inch diameter

CLARY SAGE

Clary Sage (Salvia sclarea) Grown and Utilized in the Essence Industry (For Use Only in North Carolina)

25/70

22

Weed Control	Rate (pint/acre)	Specific Use Directions
Postemergence	0.25 - 0.5	OXYFLUORFEN 4SC may be applied to established clary sage for control of henbit (Lamium amplexicaule) and other winter annual broadleaf weeds during the winter and spring season.
		Apply shortly after the first flush of henbit is in the 2-: to 4-leaf stage of growth. Additional applications may be required to control subsequent weed flushes through the spring season. After treatment, henbit will stop growing and slowly die. Increase the spray volume if weed growth is dense.

 Clary sage may respond to the topical application of this product with some marginal leaf burn, but recovery is rapid.

Crop-Specific Restrictions:

Do not apply more than 3 pints per acre per year.

COFFEE (BEARING AND NONBEARING) (For Use Only in Hawaii)

OXYFLUORFEN 4SC may be applied to established coffee, recently transplanted coffee, or as a pretransplant treatment. In established non-dormant coffee, apply as a directed spray avoiding contact with crop foliage. Newly established transplants should be healthy and well established and of sufficient size to allow use of directed sprays without contacting crop foliage.

OXYFLUORFEN 4SC may be applied over-the-top of dormant coffee transplants. Transplants are considered to be dormant when active terminal growth has ceased and terminal buds have formed. Application over-the-top of coffee plants after buds start to swell (a sign that new growth has resumed) may result in crop injury and is not recommended.

	Rate	Specific Use Directions
reemergence	(pint/acre) 1 - 4	Preemergence Weed Control:
ostemergence	T - T	 Apply as a directed spray to the orchard floor beneath established coffee plants.
		• Up to 2 pints per acre may be applied as a pre-transplant application prior to transplanting coffee plants.
	· · · · · · · · · · · · · · · · · · ·	Postemergence Weed Control: Increase the spray volume when weed growth is dense or trash is
		present; or use a higher rate within the rate range for extended residual preemergence weed control.
ank Mixing: efer to Mixing Direct	ions section for	Tank Mixing Precautions. Apply tank mixes only as a directed
recaution: To prever rift to contact active		lo not apply during periods of rapid new growth or allow spray or je.
rop-Specific Restricti		gence to direct-seeded coffee.

- 12 pints per broadcast acre per year.
- Pre-harvest Interval: Do not apply OXYFLUORFEN 4SC within one (1) day of harvest.

Key Weeds Controlled:

Preemergence	Postemergence
Ageratum Buttonweed	purslane, common spurge, garden
crotalaria purslane, common spurge, garden	

CONIFER SEEDBEDS, TRANSPLANTS, CONTAINER STOCK AND SELECTED FIELD GROWN DECIDUOUS

General Use Precautions and Restrictions:

- Not for conifer release in forest management programs or for forest regeneration applications,
- Do not apply OXYFLUORFEN 4SC in an enclosed greenhouse structure as injury to plant foliage may result.
- Do not store or transport treated container stock in an enclosed structure until completion of 4 irrigations (minimum 21 days) as injury to non-labeled plants may occur.
- Apply OXYFLUORFEN 4SC only to healthy conifer stock. Do not apply OXYFLUORFEN 4SC to conifers
 that are under stress from excessive fertilizer or soil salts, disease, nematodes, frost, drought,
 flooding, previously applied pesticides, soil insects, or winter injury, as severe injury may result.
- Do not graze or harvest livestock forage from treated areas.

Key Weeds Controlled: When OXYFLUORFEN 4SC is applied preemergence or postemergence at recommended dosages and weed stages.

Barnyardgrass[†] bedstraw, catchweed bittercress, lesser bluegrass, annual buckwheat, wild burclover carpetweed clover, red¹ clover, white[†] cocklebur, common crabgrass, large¹ fiddleneck, coast^{*} filaree, broadleaf filaree, redstem fireweed (from seed) flixweed foxtail, giant qoosegrass' groundcherry, cutleaf groundcherry, wright groundsel, common henbit imsonweed knotweed, prostrate ladysthumb lambsquarters, common lettuce, prickly mallow, little mayweed minerslettuce morningglory, ivyleaf¹ morningglory, tall¹

mustard; blue mustard, tumble mustard, wild nettle, burning nightshade, black nightshade, hairy oats, wild orach, red pepperweed, yellowflower pigweed, prostrate pigweed, redroot pimpernel, scarlet purslane, common redmaids rocket, London sandspurry, red Shepherdspurse[†] sida, prickly smartweed, Pennsylvania sorrel, red (from seed) sowthistle, annual speedwell; birdseye spurge, prostrate¹ spurge, spotted^{††} spurry, corn tansymustard thistle, bull thistle, Russian velvetleaf witchgrass woodsorrel, yellow"

[†] Highest rate and/or multiple applications may be required for acceptable control. ^{††} Preemergence control only.

CONIFER SEEDBEDS

Agricultural Use Requirements: Do not enter or allow worker entry into treated areas during the restricted entry interval (REI) of 3 days.

PPE required for early entry to treated areas that is permitted under the Worker Protection Standard and that involves contact with anything that has been treated, such as plants, soil or water, is:

- Coveralls
- Chemical-resistant footwear plus socks
- Chemical-resistant gloves made of any waterproof material.
- Shoes plus socks

OXYFLUORFEN 4SC provides both postemergence and residual preemergence control of many broadleaf weeds and annual grass species.

Seeded conifers are tolerant to preemergence and postemergence applications of OXYFLUORFEN 4SC. For weed control during the establishment of conifer seedlings, OXYFLUORFEN 4SC can be applied after seeding of conifers, but prior to emergence. For weed control in emerged conifers, OXYFLUORFEN 4SC may be applied over-the-top, but the application must be delayed at a minimum of 5 weeks after seedling emerges. If applying during cool or cloudy weather, make certain that seedlings have hardened-off prior to spraying.

Weed Control	Rate (pint/acre)	Specific Use Directions
Preemergence	0.5 - 2	Application after planting, but prior to emergence of conifer seedlings: Where grass weeds are present, apply 1 to 2 pints of OXYFLUORFEN 4SC per acre. In known areas of high weed competition, apply 2 pints of OXYFLUORFEN 4SC per acre. Broadcast to beds and irrigate with 1/2 to 3/4 inch of sprinkler irrigation before weed emergence. OXYFLUORFEN 4SC is most effective on annual grasses when applied preemergence:
Postemergence	0.5 - 1	Application after emergence of conifer seedlings: Application should be made to seedling weeds less than 4 inches in height (seedling grasses not exceeding the 2-leaf stage). Depending of subsequent weed flushes, multiple applications may be necessary to achieve season-long weed control.

Chemigation: OXYFLUORFEN 4SC may be applied at labeled rates through sprinkler irrigation systems. For center pivot irrigation systems, apply the specified dosage of OXYFLUORFEN 4SC per acre metered at a continuous uniform rate during the entire irrigation period, otherwise meter OXYFLUORFEN 4SC at a continuous uniform rate during the middle 1/3 of the irrigation period. When applying by sprinkler irrigation, follow directions given in the Chemigation Instructions section of this label.

- Precautions:
- Occasionally spotting, crinkling, or flecking may appear on leaves of conifers. Leaves that receive direct spray or drift may be injured, but typically outgrow this condition rapidly and develop normally.
- Crop-Specific Restrictions:

Do not apply more than 4 pints of OXYFLUORFEN 4SC per acre per year

OXYFLUORFEN 4SC may be applied to conifer seedbeds of the following species:

Important: When applied as directed, the conifer species listed on this label have shown tolerance to OXYFLUORFEN 4SC. It is impossible, however, to evaluate this product on all varieties, biotypes and cultivars of listed species under all possible growing conditions. Until familiar with results under local growing conditions, the user should exercise reasonable judgment and caution with this product. Limit application of this product to a few plants in a small area to determine plant tolerance and extent of injury if such occurs, prior to initiating large-scale applications.

Douglas fir	Pseudotsuga menziesii	
Fir	Fraser (Abies fraseri) Grand (Abies grandis)	
	Noble (Abies procera)	
Hemlock	Eastern hemlock (Tsuga canaden	sis)
Pine	Austrian (Pinus nigra) Eastern White (Pinus strobus)	
	Himalayan (Pinus wallichiana) Jack (Pinus banksiana) Loblolly (Pinus taeda)	
	Lodgepole (Pinus contorta) Longleaf (Pinus palustris)	
	Monterey (Pinus radiata) Mugo (Pinus mugo),	
	Ponderosa (Pinus ponderosa) Scotch (Pinus sylvestris)	
	Shortleaf (Pinus echinata) Slash (Pinus e/liottii) Virginia (Pinus virginiana)	
Spruce	Blue (Picea pungens) Dwarf (Picea glauca Conica)	
	Alberta (Picea abies) Norway (Picea sitchensis)	
	intervery (incea sitericiisis)	

CONIFER TRANSPLANTS AND CONTAINER STOCK (INCLUDES 2-0 SEEDLING AND CHRISTMAS TREE PLANTINGS)

Agricultural Use Requirements: Do not enter or allow worker entry into treated areas during the restricted entry interval (RE1) of 6 days.

PPE required for early entry to treated areas that is permitted under the Worker Protection Standard and that involves contact with anything that has been treated, such as plants, soil or water, is:

- 1. Coveralls
- 2. Chemical-resistant footwear plus socks
- 3. Chemical-resistant gloves made of any waterproof material
- 4. Shoes plus socks

Many container-grown conifers and conifer transplants are tolerant to preemergence and postemergence applications of OXYFLUORFEN 4SC. Applied postemergence, OXYFLUORFEN 4SC provides postemergence control of emerged weeds and preemergence residual control of many broadleaf weeds and grasses (see Key Weeds Controlled) at the beginning of this section.

Weed Control	Rate (pint/acre)	Specific Use Directions
Preemergence Postemergence	2 - 4	Transplanted and Container Grown Conifers: For best results, preemergence applications should be made immediately after
r osterner genee		transplanting seedlings or to weed-free container stock. Postemergence applications should be made to weeds less than 4
		inches in height. Two applications may be necessary, in fall- transplanted conifer fields, for season-long weed control. The addition
		of a non-ionic surfactant (0.25% v/v) labeled for application to growing crops, enhances the activity of OXYFLUORFEN 4SC on emerged weeds.

Do not make over-the-top applications during periods of active conifer growth. Apply only before bud break or after new terminal growth has hardened off.

Crop-Specific Restrictions:

Do not apply more than 4 pints of OXYFLUORFEN 4SC per acre in a single application or more than 8 pints per acre per year.

In addition to those conifer species listed under the Conifer Seedbed section, the following conifer species have been shown to be tolerant to OXYFLUORFEN 4SC:

1.5.5 P. 1.5.	· · · · · · · · · · · · · · · · ·	• ·	· •
Arborvitae	Thuja occidentalis Thuja orientalis	• • • •	
Juniper	Juniperus chinensis Juniperus horizontalis Juniperus procumbens Juniperus sabina		
	Juniperus scopulorum		
Red cedar	Juniperus virginiana		
Western	Tsuga heterophylla		
Yew	Taxus species	a ta s	, set i .

SELECTED FIELD-GROWN DECIDUOUS TREES

Listed field-grown deciduous trees are tolerant only to directed spray applications of OXYFLUORFEN 4SC. OXYFLUORFEN 4SC provides both preemergence and postemergence control of listed broadleaf weeds and grasses.

Timing to Crop: Apply OXYFLUORFEN 4SC to established deciduous trees or after transplanting. For optimum weed control, applications should be made prior to weed germination. Apply only as a directed spray to soil beneath the trees.

Weed Control	Rate	Specific Use Directions
a transformer and the second	(pint/acre)	
Preemergence	1 - 3	OXYFLUORFEN 4SC may be applied to established deciduous trees
Early postemergence		or after transplanting as a single or split application: Apply as a
		directed spray to the soil surface. Use of spray shields to reduce
		exposure of foliage and bark is recommended. The addition of a
		non-ionic surfactant (0.25% v/v) labeled for application to growing
· · · ·		crops, will enhance herbicidal activity on emerged weeds.
		Spot Application: Spot treatments at recommended rates may be
		used to control localized weed infestations. See use directions for
		Spot Application in the Application Methods and Recommended
		Cultural Practices section.
	3	
Directions section for T Precautions:		
trees have initiated	I dormancy in	ted applications should be prior to budbreak in the spring or after. the fall. Avoid contact of spray or drift with foliage or stems with
		swell may result in crop injury and is not recommended. If a non-

1.3

¹ Do not apply to maple trees used for production of maple sap or maple syrup. ¹¹ Apply only to nonbearing trees. For bearing treefruit, nut and vine crops, refer to specific use directions in the Treefruit/Nut/Vine section of this label.

CORN

FOR USE ONLY ON FIELD CORN IN CONJUNCTION WITH THE USDA WITCHWEED ERADICATION PROGRAM IN NORTH CAROLINA AND SOUTH CAROLINA

Apply OXYFLUORFEN 4SC only as a directed spray from May through August for preemergence and postemergence control of witchweed (Striga asiatica). Corn must be a minimum of 24 inches tall at the first application. Examine witchweed infested fields during the early part of the growing season to determine uniformity of corn stand and grass weed pressure. If necessary, cultivate weed-infested fields prior to initial application of OXYFLUORFEN 4SC to allow for optimum soil coverage during the initial application. Fields treated with OXYFLUORFEN 4SC should be inspected regularly for any breakthrough of witchweed. If breakthrough occurs, a second application should be made as soon as possible after appearance of witchweed. Repeat treatments should occur prior to bloom stage to prevent seed set.

Weed Control	Rate (pint/acre)	Specific Use Directions
Preemergence	1 - 1.5	Initial Application: Apply as a directed spray over the entire row surface at the rate of 1 pint per acre. Use up to 3 pints per acre in areas of heavy witchweed infestation. Use a minimum spray volume of 20 gallons per acre and a non-ionic surfactant at the rate of 2 pints per 1 00 gallons of spray.
Postemergence	0.5 - 1	Repeat Applications: In case of witchweed breakthrough a repeat application may be made at 0.5 to 1 pints per acre.
Precautions:		

 Do not spray over the top of the corn, as this may result in severe corn injury. Spray should contact only the lower 3 to 8 inches of the corn stalk and any leaves in this zone. Spray droplets contacting the lower leaves will cause necrotic spotting or streaking of sprayed tissue.

Crop-Specific Restrictions:

Do not apply more than 2.5 pints (1.25 lb active) of OXYFLUORFEN 4SC per acre during the growing season.

Do not apply any apply within 60 days of harvest.

Do not use corn plants from a treated field for green chop, ensilage, forage, or fodder:

COTTON .

Application Methods and Equipment:

OXYFLUORFEN 4SC may be applied as a post-direct spray to cotton a minimum of 6 to 8 inches, tall. Care must be exercised to avoid spray contact with the cotton leaves. Use rigid precision ground spray equipment and spray shields to prevent spray contact with cotton foliage. Use branch lifters or shields, as necessary, to avoid contact of directed sprays with cotton plant.

Accurate placement of spray nozzles is essential for uniform coverage of weeds and to minimize injury to cotton plants. Use a minimum broadcast spray volume of 20 gallons per acre and operate the sprayer at the minimum spray pressure recommended by the spray nozzle manufacturer. OXYFLUORFEN 4SC may be applied as a post-direct spray with only 2 flat fan nozzles per row (1 nozzle on each side of the row). For optimum coverage, use 4 flat fan nozzles per row (2 nozzles on each side of the row). The 2 forward nozzles should point forward and downward while the rear nozzles should point to the rear and downward. With either sprayer setup, nozzles should be carefully adjusted to cover the weed foliage with minimum contact to cotton plants. OXYFLUORFEN 4SC may also be applied as a band application. Do not use hollow cone nozzles.

Tank Mixing:

For control of additional broadleaf and grass weeds, OXYFLUORFEN 4SC may be applied as a postemergence directed spray in tank, mix combination with other herbicides registered for postemergence use in cotton (see Tank Mixing Precautions under Mixing Directions).

Weed Control	Rate (pint/acre)	Specific Use Directions
Postemergence	0.5 - 1	Apply as a post-directed spray. For optimum control, use the 1 pint per acre rate on actively growing weed seedlings with no more than 4 true leaves (not counting cotyledon leaves).
		Effective control of succulent weeds at the 2- to 3-leaf stage can usually be obtained at the 0.5 pint per acre rate. See Mixing Directions for surfactant recommendations.
		Where available, irrigation may be applied prior to application of OXYFLUORFEN 4SC to encourage maximum weed emergence. Irrigation following application will improve preemergence activity of OXYFLUORFEN 4SC against nightshade and groundcherry species.

- Precautions:
- Do not apply to cotton less than 6 inches tall or severe crop injury will result.
- Exercise care to avoid spray contact with cotton leaves. Leaves accidentally sprayed will exhibit necrotic (dead) spots and may be dropped from the plant. Crop injury may be enhanced if application is made when excessive soil moisture is present or rainfall occurs immediately after application, however, cotton will outgrow this condition and develop normally.
- Crop-Specific Restrictions:
- Western Cotton (AZ and CA): Do not apply more than 1 pint (0.5 lb active) of OXYFLUORFEN 4SC per acre in a single application, or more than a total of 2 pints (1.0 lb active) of OXYFLUORFEN 4SC per broadcast acre per season as a result of multiple applications. Do not apply within 75 days of harvest.
- Southern Cotton (All other states): Do not apply more than 1 pint (0.5 lb active) of OXYELUORFEN 4SC per acre of per season as a result of a single application or multiple applications. Do not apply within 90 days of harvest.

Knowtweed, prostate	Shepherdspurse
Lambsquarter, common	Smartweed, Pennsylvania

EUCALYPTUS

Apply OXYFLUORFEN 4SC for preemergence and postemergence control of listed broadleaf weeds in established eucalyptus plantings.

Weed Control	Rate (pint/acre	Specific Use Directions
Preemergence Postemergence	23	 Directed Spray: OXYFLUORFEN 4SC may be applied as a single or split application. Apply as a directed spray to soil at the base of eucalyptus trees. Use the higher rate in the rate range for extended preemergence weed control or for postemergence control of weeds up to the 6 leaf stage. The addition of a non-lonic surfactant at the rate of 2 pints per 100 gallons of spray, will enhance the postemergence activity of OXYFLUORFEN 4SC on emerged weeds. Over-the-Top Application: In new plantings, apply OXYFLUORFEN 4SC just before or immediately after transplanting eucalyptus seedlings that are in a dormant
Precautions:		condition (i.e., leaves may be present, but terminal growth has hardened off and terminal buds have formed). In established plantings, OXYFLUORFEN 4SC may be applied as an over-the-top spray when plants are in a dormant condition. FLUORFEN 4SC only to healthy "dormant" healthy eucalyptus stock. In

established plantings, use spray shields, if needed, to prevent exposure of foliage and bark of small and/or actively growing plants.

To avoid phytotoxicity, make over-the-top applications only to eucalyptus trees in a dormant condition. Do not make over-the-top applications after bud break and resumption of active growth.

Crop-Specific Restrictions:

Do not apply more than 3 pints of OXYFLUORFEN 4SC per acre in a single application or more than 9 pints per acre per year.

USE ON FALLOW BEDS

(Not for use prior to planting soybeans in California)

Used alone or in tank mix combination with glyphosate, OXYFLUORFEN 4SC provides preemergence and/or postemergence control of winter annual broadleaf weeds on land to be planted to crops.

Prior to planting, treated fallow beds should be thoroughly tilled (incorporated) to a depth of at least 2.5 inches. OXYFLUORFEN 4SC is no longer herbicidally effective once the active layer in the soil surface is disrupted by soil incorporation.

Aerial Application: OXYFLUORFEN 4SC may be aerially applied for weed control in fallow beds. Follow requirements for Aerial Application in the General Information section of this label.

filaree, whitestem	redmaids
geranium, Carolina	rocket, London
groundcherry, cutleaf	Shepherdspurse
groundsel, common	Sida, prickly
henbit	sowthistle, annual
ladysthumb	velvetleaf (wild cotton)

Thorough spray coverage is essential to maximize the postemergence activity of OXYFLUORFEN 4SC. For postemergence control when applied by air, a tank mixture of OXYFLUORFEN 4SC with either glyphosate or paraquat (Gramoxone) is recommended.

Requires maximum rate and/or multiple applications for effective control,

FALLOW LAND

(For Use Only In Idaho, Oregon and Washington)

Used alone or in a tank mix combination with glyphosate, OXYFLUORFEN 4SC provides preemergence and/or postemergence control of listed annual broadleaf weeds in a fallow land system. GoalTender may be used to reduce weed growth prior to the establishment of a dry soil mulch. Use is restricted to summer fallow on land that will be planted the following year to winter wheat, barley or oats.

Weed Control	Rate (pint/acre)	Specific Use Directions
Preemergence Postemergence	0.25 - 1	OXYFLUORFEN 4SC Alone: Preemergence weed control occurs as seedling weeds come in contact with the soil-applied herbicide during emergence. Postemergence weed control is most effective when OXYFLUORFEN 4SC is applied to seedling weeds less than 4 inches in height. Apply OXYFLUORFEN 4SC in 15 or more gallons of water per acre and increase spray volume if weed growth is dense. Use of an 80% active nonionic surfactant cleared for use on growing crops is recommended for optimum postemergence weed control.
tank mixed with labeled	rates of glyph sate product. I	grass weeds, 0.25 - 1 pint/acre of OXYFLUORFEN 4SC may be losate. Follow label-instructions for Fallow and Reduced Tillage Refer to Mixing Directions section for Tank Mixing Precautions.

• Do not apply more than 1 pint per acre per application or more than 1 pint per use season.

Key Weeds Controlled:

OXYFLUORFEN 4SC provides preemergence and postemergence control of the following weeds on fallow land:

fiddleneck, coast	pigweed, redroot
henbit	Purslane, common
lettuce, prickly (china lettuce)	Shepherdspurse
mustard, blue (purple	Sowthistle, annual
mustard)	
mustard, tumble (Jim Hill	
mustard)	

GARBANZO BEANS

(For Use Only in Arizona and California)

GARLIC

Agricultural Use Requirements: Do not enter or allow worker entry into treated areas during the restricted entry interval (REI) of 48 hours.

PPE required for early entry to treated areas that is permitted under the Worker Protection Standard and that involves contact with anything that has been treated, such as plants, soil or water, is:

- Coveralls
- Chemical-resistant footwear plus socks
- Chemical-resistant gloves made of any waterproof material
- Shoes plus socks

Cultural Considerations: For optimum preemergence weed control, the soil surface should be smooth and free of excessive trash (clippings, plant residues, etc.). Following application, treated beds should be left undisturbed during the time period for which weed control is desired. Cultural practices that result in soil disturbance or redistribution or untreated soil can result in reduced weed control.

Direct Seeded Garlic (Postemergence Application):

Weed Control	Rate	Specific Use Directions
	(per acre)	
Postemergence	1 – 2 fl. oz.	Northeastern States Including Connecticut, Maine,
		Massachusetts, New Hampshire, New Jersey, New York, Rhode
and the second second		Island and Vermont: Apply OXYFLUORFEN 4SC at 1 to 2 fl oz
		per acre to seeded garlic that has at least 3 true leaves using
		ground equipment. Multiple treatments at 1 to 2 fl oz per acre
		may be applied up to a maximum of 1 pint (16 fl oz) per acre
		pre use season. For optimum postemergence control, apply
		when susceptible weeds are in the 2 to 4-leaf stage and
19		actively growing. Application at later than 4-leaf growth stage
		may result in reduced weed control.
Postemergence	0.25 – 0.5 pints	Western States Including Arizona, California, Colorado, Idaho,
		Nevada, New Mexico, Oregon, Texas, Utah and Washington:
		Apply OXYFLUORFEN 4SC at 0.25 to 0.5 pint per acre to
		seeded garlic that has at least 2 true leaves using ground
		equipment. Multiple treatments at 0.25 to 0.5 pint per acre
		may be applied up to a maximum of 1.25 pints per acre pre
		use season. For optimum postemergence weed control, apply
		when susceptible weeds are in the 2 to 4-leaf stage and
		actively growing. Application at later than 4-leaf growth stage
		may result in reduced weed control.
Postemergence	0.25 pints	All Other States:
		Apply OXYFLUORFEN 4SC at 0.25 pint per acre to seeded garlic
		that has at least 2 true leaves using ground equipment.
		Multiple treatments at 0.25 pint per acre may be applied up to
		a maximum of 1 pint per acre pre use season. For optimum
		postemergence control, apply when susceptible weeds are in
		the 2 to 4-leaf stage and actively growing. Application at later
		than 4-leaf growth stage may result in reduced weed control.
······································		

Direct Seeded Garlic (California Only)

Weed Control	Rate	Specific Use Directions
· · · · ·	(per acre)	
Preemergence Postemergence	0.5 pints	Application after planting but Prior to Garlic Emergence: Apply OXYFLUORFEN 4SC after planting, but prior to crop emergence, for preemergence control of listed broadleaf and grass weeds using ground, air or sprinkler irrigation (chemigation).
		Aerial Application: Apply in a minimum spray volume of 10 gallons per acre. Follow Aerial Application instructions and precautions in the General Information section of this label.
		Postemergence Directed Application: Apply OXYFLUORFEN 4SC as a directed spray to garlic that is at least 12 inches tall. Accurate, uniform placement of directed postemergence sprays is essential for effective weed control and to minimize injury to garlic plants. Use low-pressure sprays and a minimum spray volume of 20 gallons per acre: Adjust nozzles for minimum spray contact with garlic plants, directing the spray to the soil at the base of garlic plants and adjacent bed top and furrow area. For optimum postemergence control, apply when susceptible weeds are in the 2 to 4-leaf stage and actively growing. Application at later than 4- leaf growth stage may result in reduced weed control.
		Sprinkler Irrigation (Portable Lateral or Solid Set) Preemergence or Postemergence: Apply OXYFLUORFEN 4SC at the recommended broadcast application rate using sufficient irrigation to wet soil-to a depth of 2 inches. Apply after planting but prior to garlic emergence or postemergence when garlic is at least 12 inches tall. Follow the application directions and precautions for "Sprinkler Chemigation" given in the Chemigation section of this label.

 Garlic Response to Preemergence Applications of OXYFLUORFEN 4SC: Following a preemergence application of OXYFLUORFEN 4SC, a chlorotic band around some of the leaves may be observed after the first irrigation (or rainfall) following garlic emergence.

Transplanted Garrie, FOS	ternergence A	oplication Immediately after Planting
Weed Control	Rate	Specific Use Directions
	(per/acre)	
Preemergence	up to 1 pint	All States Except Northeastern States:
Postemergence		Transplanted garlic is most tolerant of a postemergence
		application immediately after transplanting. An application of up
		to 1 pint per acre may be made within two days after
		transplanting, if less than 1 pint per acre is applied, a second
· · ·		application can be made two weeks or more after transplanting.
	·	Do not exceed the maximum use rate of 1 pint per acre of
		OXYFLUORFEN 4SC per season as a result of multiple
		applications.

39

Transplanted Garlic: Pos	stemergence A	pplication Immediately after Planting
Weed Control	Rate (per/acre)	Specific Use Directions
Preemergence Postemergence	1 - 2 fl oz	Northeastern States, including Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Rhode Island and Vermont: Multiple treatments at 1 to 2 fl oz per acre may be applied up to a maximum of 1 pint (1 6 fl oz) per acre pre use season.

Key Weeds Controlled:		· 24
canarygrass (annual)	puncturevine	· · ·.
eveningprimrose, cutleaf	purslane, common [†]	
groundsel, common	rocket, London	
mallow, little (malva)	sage, lanceleaf	· · · .
nightshade, black	shepherdspurse	- · . · ·
pigweed, prostrate [†]	sowthistle, annual	
piqweed, redroot [†]		

Key weeds controlled at recommended rates in Northeastern States.

Garlic - Crop-Specific Precaution (Postemergence Application):

 Postemergence applications of OXYFLUORFEN 4SC may cause chlorotic leaf banding, necrotic lesions, or stunting of the garlic plants. Symptoms may be more severe if garlic emerged under cool, wet, overcast, or foggy weather. These conditions are temporary and should not affect the vigor or development of garlic plants.

Crop-Specific Restrictions (Applicable to All Methods of Application):

- In all states except Northeastern states, do not apply until direct seeded garlic plants have two (2)fully developed true leaves: In the Northeastern states, do not apply until direct seeded garlic plants have three (3) fully developed true leaves. Application made prior to the specified growth stage may result in serious crop injury and is not recommended.
- Do not apply more than a total of 1 pint per acre of OXYFLUORFEN 4SC per use season as a result of multiple applications.
- Do not apply within 60 days of harvest.
- In direct seeded garlic (except in California), do not apply OXYFLUORFEN 4SC as a preemergence treatment.
- Use only on dry bulb garlic.
- Do not apply to garlic grown for seed.
- For weed control in garlic, do not mix OXYFLUORFEN 4SC with oils, surfactants, liquid fertilizers or
- pesticides except as specified on approved Albaugh, Inc Supplemental Labeling.
- Do not apply to garlic plants that are under stress due to drought, flooding, excessive fertilizer or soil salts, storage conditions, wind injury, hail, frost damage, injury from previously applied pesticides, or injury due to insects, nematodes or diseases.

GUAVA (Bearing and Non-bearing) (For Use Only in Hawaii)

Weed Control	Rate (pint/acre)	Specific Use Directions
Preemergence	2.5 - 4	Preemergence or Postemergence: In established guava plantings, apply preemergence or
Postemergence	1 - 4	 postemergence to weeds. Increase the spray volume to ensure adequate coverage in high densities of emerged weeds or heavy trash. Minimize contact with guava plants by directing the spray to the soil surface. Spray shields are suggested to minimize spray contact in young plantings. For broader spectrum postemergence control of grass and broadleaf weeds, OXYFLUORFEN 4SC may be applied in tank mix combination with paraquat (Gramoxone) or glyphosate. Follow applicable use directions, precautions and limitations on the labels of the respective tank mix products.

Precautions:

Prevent direct spray or drift from contacting green stems, fruit or foliage, as injury may result. Alone or in tank mix combination, OXYFLUORFEN 4SC should be applied to only healthy growing

- trees.
- Application of OXYFLUORFEN 4SC should be made only after new follage growth has hardened off.

Crop-Specific Restrictions:

Do not apply more than 4 pints per acre of OXYFLUORFEN 4SC in a single application or more than

41

- 8 pints per season.
- Do not apply OXYFLUORFEN 4SC within 1 day of harvest.

Key Weeds Controlled:

Preemergence	Postemergence -
ageratum buttonweed	purslane, common spurge, garden
crotalaria purslane, common spurge, garden	

HORSERADISH

Agricultural Use Requirements: Do not enter or allow worker entry into treated areas during the restricted entry interval (REI) of 48 hours.

PPE required for early entry to treated areas that is permitted under the Worker Protection Standard and that involves contact with anything that has been treated, such as plants, soil or water, is:

- Coveralls
- Chemical-resistant footwear plus socks
- Chemical-resistant gloves made of any waterproof material
- Shoés plus socks

Weed Control	Rate	Specific Use Directions
	(pint/acre)	
Preemergence	1	Apply OXYFLUORFEN 4SC after the horseradish roots have been
		planted but prior to emergence of new horseradish leaves.
		Emerged leaves that receive direct or indirect spray (drift)
	1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1	contact will be injured. If necessary, cultivate before application
		to destroy germinated weeds.

Precautions:

 Do not apply OXYFLUORFEN 4SC to horseradish plantings that have been weakened or stressed due to unfavorable temperature conditions, disease, fertilizer, nematodes, insects, pesticides, drought or excessive moisture.

42

Crop-Specific Restrictions:

Do not apply more than 1 pint of OXYFLUORFEN 4SC per acre per crop.

JÓJÓBA

Weed Control	Rate	Specific Use Directions
	(pint/acre)	
Preemergence	2 - 3	Initial application may be made when jojoba plants have
Postemergence		reached a height of 6 inches or more. Use sufficient spray
		volume to ensure thorough coverage of dense weed growth.
		Sprays should be directed to the base of jojoba plants to avoid
		possible phytotoxicity to foliage. Spray shields are suggested
•		for use in young plantings. Use higher rate in rate range for
		extended residual preemergence weed control. Make follow-
and the second		up applications as necessary to maintain weed control
		For early postemergence control of susceptible seedling weeds
		(less than 8 inches tall) a pply OXYFLUORFEN 4SC at the rate
		of 2 pints per acre. OXYFLUORFEN 4SC may be applied at the
10 		rate of 3 pints per acre for postemergence control of weeds
		up to 12 inches tall. For optimum residual control, apply
		during the fall or winter months. Control may be
		unsatisfactory for weeds greater than 12 inches tall.
Precautions:		
		ith jojoba flowers or buds as severe injury may result.

Over-the-top applications may cause burning, crinkling or bronzing of jojoba foliage, particularly to the youngest leaves, flowers, or buds present at the time of application.

Crop-Specific Restrictions:

Do not apply more than 3 pints per acre per year •

Key Weeds Controlled:

Premergence	Postemergence
burclover	fiddleneck, coast
fiddleneck, coast	filaree, broadleaf ¹¹
filaree, broadleaf	filaree, redstem ¹¹

rocket, London	
shepherdspurse	
sowthistle, annual	

[†] Highest rate may be required for acceptable postemergence control. ^{††} OXYFLUORFEN 4SC at the 3-pint rate will provide control of filaree not exceeding the 4-inch stage. Applications to filaree beyond the 4-inch stage may result in partial control.

MINT (SPEARMINT AND PEPPERMINT)

Mint (Spearmint and Per	opermint) Gro	own on Mineral Soils
Weed Control	Rate	Specific Use Directions
	(pint/acre)	
Preemergence	2 - 3	Oregon and Washington (East of Cascades), California, Montana,
Postemergence		Idaho, Nevada, South Dakota and Utah:
		Apply from December through March when mint is dormant. When
		used postemergence (to weeds); add an 80% active ingredient
		nonionic surfactant at the rate of one quart per 100 gallons of
		spray volume and apply before weeds exceed a height of 4 inches.
7		
		Late winter applications will provide maximum activity on summer
		weeds; but summer grass control may be inconsistent. For best
		results, fall-plowed fields should be harrowed to provide a smooth surface for application. In furrow-irrigated fields, corrugating must
	en e	be done prior to application. Corrugating or harrowing will result in
· · · · ·		disturbance of treated soil or movement of untreated soil into
		treated areas, resulting in poor weed control.
Preemergence	1 - 1.5	Peppermint (Western Oregon Willamette Valley):
		Apply OXYFLUORFEN 4SC from November through February to
		dormant peppermint only. Treatments in January or February
		generally provide better residual preemergence control of annual
		broadleaf weeds. Full season weed control should not be expected
		from this treatment.
Precautions:		
 Application must be 	made prior to	emergence of new spring growth or severe crop injury may result.
		pply OXYFLUORFEN 4SC to mint that has been plowed.
		healthy stands of spearmint and peppermint. Do not apply to
		ed by disease, drought, flooding, excessive fertilizer, soil salts, hatodes, insects, or winter injury, as severe injury may result.
Crop-Specific Restriction		ication of OXYELLIOREEN 4SC per season

Key Weeds Controlled:	
bedstraw, catchweed	'oats, wild
[†] bluegrass, annual	orach, red
fixweed	pepperweed, yellowflower
groundsel, common	pigweed, redroot
lambsquarters, common	ryegrass, Italian
lettuce, prickly (china lettuc	ce) shepherdspurse
mustard, blue (purple	sowthistle, annual
mustard)	tansymustard
mustard, tumble (Jim hill	thistle, Russian
mustard)	
nightshade, hairy	

Control of annual grasses is best obtained when OXYFLUORFEN 4SC is applied prior to emergence. Postemergence control of winter annual grasses is generally unsatisfactory if applications are made after the 1 to 2-leaf stage.

Weed Control	Rate (pint/acre)	Specific Use Directions
reemergence ostemergence	2 - 3	Note: Use directions in this section apply only to spearmint and peppermint grown on muck soils (organic matter content of 20% or greater). When used postemergence (to weeds), add an 80% active ingredient nonionic surfactant at the rate of one quart per 100 gallons of spray volume and apply before weeds exceed a height of 4 inches.
To avoid excessive cr peppermint. Apply OXYFLUORFEN	op injury, do 4SC only to	emergence of new spring growth or severe crop injury may resul o not apply within 4 days of planting (sprigging) spearmint or healthy spearmint or peppermint. Do not apply to spearmint or hed by disease, nematodes; soil insects, or winter injury, as severe

NON-CROP USE

(Non-Food-Producing, Non-Cultivated Agricultural or Non-Agricultural Areas, such as Highway and Utility Rights-of-Way, Industrial Sites, Tank Farms, Storage Areas, Airports, Fencerows, and Farmsteads)

Weed Control	Rate (pint/acre)	Specific Use Directions
Preemergence	2.5 - 4	Preemergence: Use higher rate in rate range for longer residual control.
Postemergence		Postemergence: Use the lower rate in the rate range for control of susceptible weeds in the early postemergence stage, less than 4 inches tall. Use the higher rate for weeds up to 12 inches tall. Application to weeds beyond the 4-inch stage may result in partial control.

directions, precautions, and limitations on the respective product labels. In interpreting the labels of tank mixed products, the most restrictive label limitations must apply.

 Preemergence: For broader-spectrum residual preemergence weed control, OXYFLUORFEN 4SC may be applied in tank mix combination diuron (Karmex) or simazine.

46

 Postemergence: For additional postemergence control of susceptible grass and broadleaf weeds, OXYFLUORFEN 4SC may be applied in tank mix combination with paraquat (Grarhoxone) or glyphosate.

Site-Specific Restrictions:

- Do not feed or allow animals to graze on any area treated with OXYFLUORFEN 4SC.
- Do not apply more than 4 pints per acre, in a single application.

ONIONS

Agricultural Use Requirements: Do not enter or allow worker entry into treated areas during the restricted entry interval (REI) of 48 hours.

PPE required for early entry to treated areas that is permitted under the Worker Protection Standard and that involves contact with anything that has been treated, such as plants, soil or water, is:

- Coveralls
- Chemical-resistant footwear plus socks
- Chemical-resistant gloves made of any waterproof material
- Shoes plus socks

Cultural Considerations:

For maximum preemergence activity, the soil surface should be smooth and free of excessive trash (clippings, plant residues, etc.). Following application, cultural practices that result in redistribution or disturbance of the soil surface or move untreated soil into treated areas will reduce weed control. For best results, make applications to established beds that are left undisturbed during the time period for which weed control is desired.

Direct Seeded Onions	: Postemergen	ce Application
Weed Control	Rate (per acre)	Specific Use Directions
Postemergence	1 - 2 fl oz	Northeastern States Including Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Rhode Island and Vermont: Apply OXYFLUORFEN 4SC at 1 to 2 fl oz per acre to seeded onions that have at least 3 true leaves using ground equipment. Multiple treatments at 1 to 2 fl oz per acre may be applied up to a maximum of 1 pint (16 fl oz) per acre pre use season. For optimum postemergence control, apply when susceptible weeds are in the 2 to 4-leaf stage and actively growing.
Postemergence	0.25 - 0.5 pints	Western States Including Arizona, California, Colorado, Idaho, Nevada, New Mexico, Oregon, Texas, Utah and Washington: Apply OXYFLUORFEN 4SC at 0.25 to 0.5 pint per acre to seeded onions that have at least 2 true leaves using ground equipment. Multiple treatments at 0.25 to 0.5 pint per acre may be applied up to a maximum of 1.25 pints per acre pre use season. For optimum postemergence control, apply when susceptible weeds are in the 2 to 4-leaf stage and actively growing.
Postemergence	0.25 pints	All Other States: Apply OXYFLUORFEN 4SC at 0.25 pint per acre to seeded onions that have at least 2 true leaves using ground equipment. Multiple treatments at 0.25 pint per acre may be applied up to a maximum of 1 pint per acre pre use season. For optimum postemergence control, apply when susceptible weeds are in the 2 to 4-leaf stage and actively growing.

Direct Seeded Onions	: Postemerger	ice Application
Weed Control	Rate (per acre)	Specific Use Directions
Postemergence	(see above)	Sprinkler Irrigation - All Except Northeastern States (Center Pivot, Portable Lateral or Solid Set): Apply OXYFLUORFEN 4SC at the recommended broadcast application rate using sufficient irrigation to wet soil to a depth of 2 inches. Follow the application directions and precautions for "Sprinkler Chemigation" given in the Chemigation section of this label.

Transplanted Onion	ns: Application Im	mediately before Planting
Weed Control	Rate	Specific Use Directions
	(per acre)	
Preemergence	0.5 – 1 pint	Pre-transplant Application (Not for Use in Northeastern States or
Postemergence		Western States:
		OXYFLUORFEN 4SC may be applied as a broadcast or band
		application after completion of tillage operations, but before
		transplanting of onion plants. Transplanting should be
	· · ·	accomplished with a minimum of soil disturbance and, for
		optimum weed control, soil surfaces should be left undisturbed
		after transplanting for the period for which weed control is
		desired. However, timely cultivation after weed emergence will
		assist in weed control. If less than 1 pint per acre was applied as
		a pre-transplant application, postemergence applications may be
		made as instructed for seeded onions. Do not exceed the
		maximum use rate of 1 pint per acre per use season as a result
		of multiple applications.

Transplanted Onions: Ap	plication mini	
Application Timing for	Rate	Specific Use Directions
Target Weeds	(per acre)	
Preemergence	up to 1 pint	All States Except Northeastern States:
		Transplanted onions are most tolerant of a postemergence application immediately after transplanting. An application of up
		to 1 pint per acre may be made within two days after transplanting. If less than 1 pint -per acre is applied, a second application can be made two weeks or more after transplanting.
		Do not exceed the maximum use rate of 1 pint per acre of OXYFLUORFEN 4SC per season as a result of multiple
		applications.
Preemergence	1 - 2 fl oz	Northeastern States including Connecticut, Maine, Massachusetts New Hampshire, New Jersey, New York, Rhode Island and Vermont:
		Multiple treatments at 1 to 3 fl oz per acre may be applied up to a maximum of 1 pint (16 fl oz) per acre pre use season.

Onions- Use Precautions (Applicable to All Areas and Methods of Application). • OXYFLUORFEN 4SC can cause necrotic lesions, twisting, pigtailing or stunting of the onion plants.

- Injury will be more severe if applications are made immediately following or during cool, wet weather and/or if applications are made prior to the specified onion growth stage of the onion plants as specified in Specific Use Directions.
- Do not apply to onion plants that are under stress due to drought, flooding, excessive fertilizer or soil salts, storage conditions, wind injury, hail, frost damage, injury from previously applied pesticides, or injury due to insects, nematodes or diseases.

Onions - Crop Specific Restrictions (Applicable to All Areas and Methods of Application):

- In all states except Northeastern states, do not apply until direct seeded onion plants have at least two (2) fully developed true leaves. In the Northeastern states, do not apply until direct seeded onion plants have at least three (3) fully developed true leaves. Application made prior to the specified growth stage may result in serious crop injury and is not recommended.
- Do not apply more than a total of 1 pint per acre of OXYFLUORFEN 4SC per use season as a result of multiple applications.
- Do not apply within 45 days of harvest.
- Do not apply OXYFLUORFEN 4SC as a preemergence treatment to direct seeded onions.
- Use only on dry bulb onlons.
- Do not apply to onions grown for seed, except as instructed in separate use directions.
- For use in onions, do not mix OXYFLUORFEN 4SC with oils, surfactants, liquid fertilizers or pesticides except as specified on approved Albaugh, Inc. Supplemental Labeling.

Key Weeds Controlled:

Postemergence canarygrass (annual) eveningprimrose, cutleaf ^(a) groundsel, common mallow, little (malva) nightshade, black pigweed, prostrate ^(b) pigweed, redroot ^(a,b) puncturevine purslane, common ^(a,b) rocket, London sage, lanceleaf shepherdspurse ^(b) sowthistle, annual

^(a) Weeds controlled when applied as a pre-transplant application. In addition, OXYFLUORFEN 4SC at the rate of 0.5 to 1 pint per acre will provide control/suppression of carpetweed, Pennsylvania smartweed, galinsoga, common lambsquarters, and wild mustard. Applications of OXYFLUORFEN 4SC to muck solls may result in partial control or suppression of the weeds listed.

^(b) Specific weeds controlled at rates recommended for use in northeastern states (see DOSAGE section).

ONIONS GROWN FOR SEED

Agricultural Use Requirements: Do not enter or allow worker entry into treated areas during the restricted entry interval (REI) of 48 hours.

PPE required for early entry to treated areas that is permitted under the Worker Protection Standard and that involves contact with anything that has been treated, such as plants, soil or water:

- Coveralls,
- Chemical-resistant footwear plus socks
- Chemical-resistant gloves made of any waterproof material
- Shoes plus socks

Weed Control	Rate	Specific Use Directions
State of the	(rate per acre)	
Preemergence	1 fl. oz.	Northeastern States including Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Rhode Island and Vermont:
		Multiple treatments at 1 fl oz per acre may be applied up to a maximum of 1 pint (16 fl oz) per acre pre use season. Prior to initial treatment, seeded onions must have at least four (4) true leaves. Multiple treatments at the aforementioned rate may be applied.
Preemergence	Up to 0.25	All other States:
	pints	Apply OXYFLUORFEN 4SC at up to 0.25 pint per acre to seeded onions that have at least three (3) true leaves. Multiple treatments at 0.25 pint per acre may be applied up to a maximum of 1 pint per acre, pre use season. For optimum postemergence control, apply when susceptible weeds are in the 2 to 4-leaf stage and actively growing.
		Sprinkler Irrigation - Portable Lateral or Solid Set: Apply OXYFLUORFEN 4SC at the recommended broadcast application rate using sufficient irrigation to wet soil to a depth of 2 inches. Follow the application directions and precautions for "Sprinkler Chemigation" given in the Chemigation section of this label.

- Notice: Some varieties or inbred lines of onions may be more susceptible to OXYFLUORFEN 4SC.
 Care should be taken to insure that the particular onion variety or line being grown is tolerant to OXYFLUORFEN 4SC. It is suggested that all onion varieties or lines be tested in limited areas to ensure an adequate level of crop tolerance prior to an application for postemergence weed control.
- OXYFLUORFEN 4SC can cause necrotic lesions, twisting, plgtailing or stunting of the onion plants. Injury will be more severe if applications are made immediately following or during cool, wet weather and/or if applications are made prior to the specified onion growth stage of the onion plants as specified in Specific Use Directions.
- Do not apply to onion plants that are under stress due to drought, flooding, excessive fertilizer or soil saits, wind injury, hail, frost damage, injury from previously applied pesticides, or injury due to insects or diseases.
- Crop-Specific Restrictions:
- In all states, do not apply Goal2XL until the onions have reached the minimum leaf stage specified. Application prior to the recommended stage of development may result in serious injury and is not recommended.
- Do not apply more than a total of 1 pint per acre of OXYFLUORFEN 4SC during one use season

- Do not apply within 60 days of harvest.
- For seeded onions, do not apply OXYFLUORFEN 4SC with oils, surfactants, liquid fertilizers or other pesticides except as specified in approved Albaugh, Inc. Supplemental Labeling.

amarantn, spiny purslane, common spurge, garden

SOYBEANS (Not for Use in California)

Soybeans - Early Prep	lant Application i	n Conservation Tillage Systems
Weed Control	Rate	Specific Use Directions
	(pint/acre)	
Preemergence	0.75 - 1.5	Early Preplant Application: Surface apply OXYFLUORFEN 4SC to the stale seedbed approximately 14 days before planting conservation tillage soybeans for postemergence and preemergence residual broadleaf control. Use a spray volume of 20 or more gallons per acre and increase the spray volume if growth of existing weeds is dense. OXYFLUORFEN 4SC at 1 to 1.5 pints provides early season suppression of annual grasses, but should not be relied upon as a basic grass herbicide. A planned program utilizing herbicides registered for early preplant, preemergence
		or postemergence grass control in soybeans is recommended.
		Use of ridge or slot planter or a similar planting implement that causes minimal soil disturbance is recommended. Movement or redistribution of surface soil will reduce herbicidal effectiveness.

Soybeans: No-Till (Do	uble-Crop)	
Weed Control	Rate	Specific Use Directions
	(pint/acre)	
Preemergence	0.25 - 1	Preemergence Application to Soybeans:
Postemergence		Applied preemergence, OXYFLUORFEN 4SC provides
		postemergence and residual preemergence control of
		susceptible broadleaf weeds. Apply OXYFLUORFEN 4SC within
		one day after planting. Later applications may result in severe
		-crop injury and are not recommended. Apply in a minimum
		spray volume of 20 gallons per acre and increase spray volume
		if growth of existing weeds is dense.
		ence control of existing grass and broadleaf weeds,
OXYFLUORFEN 4SC m	ay be tank mixe	d with paraquat (Gramoxone) or glyphosate. For extended
		ill soybeans, OXYFLUORFEN 4SC may also be tank mixed with a
residual grass herbicid	e such as Bronc	o Herbicide, Dual Magnum Herbicide, or Lasso Herbicide.
Postemergence	0.5	Postemergence Directed Application: OXYFLUORFEN 4SC may
· · · · · · · · · · · · · · · · · · ·		be applied as a post-directed application. Optimum control is
		achieved when OXYFLUORFEN 4SC is applied to seedling
		weeds not exceeding 4 true leaves (not counting cotyledon
		leaves) and actively growing. Use of an 80% nonionic
		surfactant cleared for application to growing crops at the rate
	· · · · ·	of 2 pints per 100 gallons of spray is recommended whenever
		postemergence weed control is desired. For postemergence
		application, Soybeans must be a minimum 8 inches tall. Use a
		minimum of 2 flat fan nozzles per row. Use branch lifters or
		shields to prevent excessive spray contact to the soybean
		plants. Do not use hollow cone nozzles.

- Tank Mixing: Read and observe all label directions before using. Follow applicable use directions, precautions and limitations on the labels of the respective tank mix products. Refer to Mixing Directions section for Tank Mixing Precautions. Follow applicable use directions, precautions, and limitations on the respective product labels. In interpreting the labels of tank mixed products, the most restrictive limitations must apply.
- Do not make more than two applications of OXYFLUORFEN 4SC per growing season.
- Do not apply more than T pints (0.5 lbs active) of OXYFLUORFEN 4SC per acre during one growing season as a result of preemergence application in no-till (double-crop) or conventional till soybeans, or post-directed in conventional till soybeans. If early preplant application is made, do not apply more than 1.5 pints (0.75 lb active) of OXYFLUORFEN 4SC per acre during one growing season.
- Do not apply a post-directed application of OXYFLUORFEN 4SC to soybeans after the initial appearance of blooms.

Key Weeds Controlled (OXYFLUORFEN 4SC Alone):

[†] Multiple applications may be required for acceptable control.

¹¹ Post-direct applications of OXYFLUORFEN 4SC will kill or suppress seedlings not exceeding the one true leaf stage.

TARO (For Use Only in Hawaii)

For use only to dryland taro grown in Hawaii. Dryland taro is defined as taro grown without irrigation, or by using irrigation practices that do not result in run-off, irrigation return flow, or other loss of irrigation water from the production area. If irrigation is used, the water applied shall not exceed the field capacity of the soil.

Weed Control	Rate (pint/acre)	Specific Use Directions
Preemergence	1	Preemergence to Taro and Weeds: A single application of OXYFLUORFEN 4SC at the rate of 2 pints per acre may be applied within 1 week after transplanting but prior to emergence of taro plants.
Postemergence	0.5	Postemergence to Taro and Weeds: OXYFLUORFEN 4SC may be applied as a post-directed or band application at the rate of 1 pint per acre. Effective control of succulent weed seedlings in the 2-to 3-leaf stage can usually be obtained. Applications to weeds beyond the 3-leaf stage may result in partial control.
 minimize crop inju 4SC must be applie Occasionally, after leaves of the taro. Do not use OXYFL 	ry. Taro folia ed, using rig the use of C Leaves that UORFEN 4SC	of OXYFLUORFEN 4SC is essential for effective weed control and to age receiving accidental spray or drift will be injured. OXYFLUORFEN id precision ground sprayer equipment. DXYFLUORFEN ASC, spotting, crinkling or flecking may appear on the receive direct or indirect (drift) spray contact will be injured. C on taro plantings that are weak, or under stress due to temperature, insects, pesticides, drought or excessive moisture.
 Crop-Specific Restrictions: Do not apply more than 1 pint of OXYFLUORFEN 4SC per broadcast acre as a single preemergence application. Do not apply more than 0.5 pint of OXYFLUORFEN 4SC per acre in a single post-direct spray or more than 1 pint per acre per season as a result of multiple post-directed applications. Do not apply more than 2 pints of OXYFLUORFEN 4SC per acre per season as a result of preemergence and post-direct applications. Do not apply more than 2 pints of OXYFLUORFEN 4SC per acre per season as a result of preemergence and post-direct applications. Do not apply OXYFLUORFEN 4SC within 6 months of harvest of taro (corms, leaves).

Crop-Specific Restrictions:

- In all states, unless otherwise specified, do not apply OXYFLUORFEN 4SC during the period between bud swell and completion of final harvest or when fruit/nuts are present. OXYFLUORFEN 4SC may be applied upon completion of final harvest.
- In Arizona and California, OXYFLUORFEN 4SC may be applied during the period following completion of final harvest up to February 15 (February 1st in the Coachella Valley, California). Applications made after these calendar dates, but prior to bud swell, may result in significant crop injury and are the responsibility of the user.
- For banded applications, up to 4 pints per acre of OXYFLUORFEN 4SC per use season may be applied within the treated band. Do not apply more than a maximum of 3 pints per acre per use season on a broadcast basis.
- Do not apply to grapes or kiwl established less than 3 years unless vines are on a trellis wire a minimum of 3 feet above the soil surface.
- Do not apply to grapes or kiwi that are not staked or trellised unless vines are free standing.
- Maximum total application rate per year is 1.5 lb/al per acre.

GRAPES (Non-Dormant Application) (California Only)

OXYFLUORFEN 4SC may be applied as a directed spray or, for supplemental preemergence weed control, through low-volume sprinkler (micro-sprinkler) or drip irrigation systems for control or suppression of listed broadleaf weeds in non-dormant-grapes (raisin and wine grapes only). OXYFLUORFEN 4SC may also be applied to all grapes (raisin, table, and wine) as a dormant season application. Refer to Treefruit/Nut/Vine Crops (Dormant Application) section above for use directions for dormant season application to grapes.

Weed Control	Rate (pint/acre)	Specific Use Directions		
Preemergence	1. (* * 2.)	OXYFLUORFEN 4SC may be applied preemergence or postemergence to weeds either as a directed spray in a minimum		
Postemergence	0.5 - 1			
When applied as a postemergence directed spray, add 1 quart 80% active nonionic surfactant cleared for application to growi crops per 100 gallons of spray. Sprays should be directed to th soil and the base of vines.				
Tank Mixing:				
may be applied in of 10 gallons pe applicable use (n tank mix with r acre. Refer directions, pre	stemergence spray using ground equipment, OXYFLUORFEN 4SC n paraquat (Gramoxone) or glyphosate in a minimum spray volume to Mixing Directions section for Tank Mixing Precautions. Follow cautions, and limitations on the respective product labels. In ixed products, the most restrictive label limitations must apply.		
 Chemigation: Follow Low Volume Sprinkler or drip Meter Goal 2 XL application during system. Use of C the "ring effect" 	chemigation in nkler (Micro spi systems desig at a continuous g the final 1/3 XYFLUORFEN of weed escap	structions in General Information section. inkler) and Drip (Trickle) Irrigation: Apply only through low-volume ned to uniformly distribute irrigation water beneath the canopy. rate during the middle 1/3 of the irrigation period and discontinue of the irrigation period to insure proper flushing of the irrigation ISC through low-volume sprinklers or drip emitters helps to reduce es in areas around sprinklers or emitters where previously applied s begin to break down.		
Precautions:				
dormant grapes. drift, soil contact grape leaves. Th expanding at the injury. Grapes ma	Grape foliage) exposure. Th e grape plant v e time of cont ay exhibit some	YFLUORFEN 4SC may result in varying degrees of injury to non- will typically exhibit injury symptoms from direct or indirect (spray is injury may result in necrosis, reddening, cupping or crinkling of will continue to grow normally: Grape leaves that are immature or act with OXYFLUORFEN 4SC are the most susceptible to foliage small blemishes (spots or flicks) on the fruit.		
 OXYFLUORFEN 4SC is phytotoxic to plant foliage. Avoid drift to all other crops and nontarget areas. Do not apply when weather conditions favor drift. 				
Crop-Specific Use Restrictions:				
 The total amour harvest through acre as a result of area of the low-v 	it of OXYFLUC dormancy to no of multiple appl olume sprinkler	RFEN 4SC applied during one season (from completion of final on-dormant use covered by this section) cannot exceed 3 pints per ications in any given area (broadcast, banded, or within the wetted or drip irrigation system).		
 Do not apply within 14 days of harvest. Do not initiate application of OXYFLUORFEN 4SC in non-dormant grapes until the completion of the 				

63

bloom period.

- Do not apply to grapes established less than 3 years unless vines are either on a trellis wire a minimum of 3 feet above the soil surface, or protected by grow tubes.
- OXYFLUORFEN 4SC should be applied only by ground application equipment or through low-. . volume sprinkler

61

- .
- (micro-sprinkler) or drip (trickle) irrigation systems. Apply OXYFLUORFEN 4SC as a non-dormant application to wine grapes or raisin grapes only. .

WINDBREAKS AND SHELTERBELTS (For Use Only in Minnesota, North Dakota, South Dakota and Wyoming)

Weed Control	Rate	Specific Use Directions
	(pint/acre)	
Preemergence	2 - 3	Apply OXYFLUORFEN 4SC may be applied as a broadcast, banded or
Postemergence		post-directed spray. Preemergence control is most effective when
		spray is applied to clean, weed-free soil surfaces. Pre-transplant
· .		applications must be made after completion of soil preparation but
		prior to transplanting. Transplanting should be completed with
		minimal soil disturbance. For optimum weed control results, treated
		soil surfaces should be left undisturbed during the time period for
		which weed control is desired.
		Postemergence Weed Control: For best results, apply before 4-leaf
2000 A. 1997 A.		stage for broadleaf weeds or 2-leaf stage for grass weeds.
		Conifers: OXYFLUORFEN 4SC can be applied pre-transplant, post-
		directed or postemergence (over-the-top) to conifers.
		Postemergence or post-directed applications should be applied prior
· · · · · · · · · · · · · · · · · · ·		to budbreak or after new growth foliage has hardened off and new
· .		terminal buds have formed.
		Deciduous Hardwoods: OXYFLUORFEN 4SC has exhibited selectivity
		to many deciduous species when applied pre-transplant or as a
		post-directed spray prior to budbreak.
Precautions:		
Important: Some varieties or cultivars of conifers or deciduous species listed may be susceptible to OXYELLOPEEN 45C. Care should be taken to answe that the particular variable to be obtained with		
OXYFLUORFEN 4SC. Care should be taken to ensure that the particular variety to be sprayed with		
OXYFLUORFEN 4SC is tolerant. For unfamiliar species, it is suggested that OXYFLUORFEN 4SC be tested on a limited number of plants prior to large-scale application.		
		DXYFLUORFEN 4SC, a spotting, crinkling or flecking may appear on
		becies. Leaves that receive direct or indirect (drift) spray contact will
		typically rapidly outgrow these symptoms and develop normally.
		y result in injury to deciduous species and is not recommended. If
non-dormant a	nlication is re	quired, apply only after foliage has fully expanded and hardened off
		contact with the foliage by applying to the soil surface as a directed
spray.	manece spray	
	REEN 4SC on	y to healthy deciduous and/or conifer trees. Do not apply
• Apply OXTELOOREEN 4SC only to healthy deciduous and/or conner trees. Do not apply OXYELUOREEN 4SC to conifers or deciduous trees that have been weakened or under stress from		
excessive fertilizer or soil salts, disease, nematodes, frost, drought, flooding, previously applied		
pesticides, soil insects, or winter injury, as severe injury may result.		
Specific Use Restric		
		ts of OXYFLUORFEN 4SC per acre in a single application or more than
9 pints per acre

Key Broadleaf Weed	s Controlled	
buckwheat, wild		hustard, wild
Deciviticacy mild	1.1	

Key Broadleaf Weeds Controlled:	
buckwheat, wild	mustard, wild
burclover	nettle, burning
carpetweed	nightshade, black
dock, curly	nightshade, hairy
groundcherry, cutleaf	oats, wild
groundcherry, Wright	orach, red

groundsel, common	pepperweed, yellow flower
henbit	pigweed, prostrate
jimsonweed	pigweed, redroot
knotweed, prostrate	purslane, common
kochia	rocket, London
ladysthumb	shepherdspurse [†]
lambsquarters, common	smartweed, Pennsylvania
lettuce, prickly	sowthistle, annual
mallow, little	tansymustard
mayweed	thistle, Russian (seedling)
mustard, blue	velvetleaf
mustard, tumble	

[†] The highest rate or multiple applications may be required for acceptable control.

Key Grasses Controlled:		
barnyardgrass	foxtail, giant	
bluegrass, annual	goosegrass	1 · ·
crabgrass, large	witchgrass	' ''

Goal 2XL may be applied to numerous conifer and deciduous species, including the following:

Conifer Species

Common Name	Scientific Name
douglas-fir	Pseudotsuga menziesii
fir	
grand	Abies grandis
fraser	Abies fraseri
noble	Abies procera
hemlock	
eastern hemlock	Tsuga canadensis
western hemlock	Tsuga heterophylla
pine	
Austrian	Pinus nigra
eastern white	Pinus strobus
jack	Pinus banksiana
Himalayan	Pinus graffithii
lobiolly	Pinus taeda
lodgepole	Pinus contorta
longleaf	Pinus palustris
monterey	Pinus radiata
mugo	Pinus mugo
ponderosa	Pinus ponderosa
scotch	Pinus sylvestris
shortleaf	Pinus echinata
slash	Pinus eiliottii
Virginia	Pinus virginiana
spruce	
blue	Picea pungens
dwarf Alberta	Picea glauca conica
Norway	Picea abies
Sitka	Picea sitchensis

Arborvitae	Thuja occidentalis Thuja orientalis
juniper	Juniperus chinensis Juniperus horizontalis Juniperus procumbens Juniperus sabina Juniperus scopulorum
red cedar	Juniperus virginiana
Yew	Taxus spp.

Deciduous Hardwood Species

Scientific Name
Fraxinus spp.
Malus spp.
Eucalyptus spp.
Syringa vulgaris
Acer nigrum
Quercus rubra
Elaeagnus angustifolia
Populus spp.
Liquidambar styraciflua
Platanus occidentalis
Juglans nigra
