The control of fungal disease is based on prevention, including keeping garden and border areas clean, destroying leaves in the fall, and applying fungicides either before or at the onset of disease. Plant surfaces must be completely covered with fungicide to successfully prevent infection. Repeat applications may be needed for adequate control. Use the highest rate indicated during conditions of severe disease pressure, such as wet or humid weather. The lower rate is suitable for general preventive applications.

MIXING AND SPRAYING DIRECTIONS

Fill spray tank half full of water. Add recommended amount of LIQUI-COP. Add balance of water.

Using either a hose-end or pressurized hand sprayer, apply at the rate of one gallon mixed spray solution to 200 sq. ft. of garden area or up to two gallons mixed spray solution to a large tree. Thoroughly wet foliage to the point of runoff, taking care to cover all plant surfaces. Agitate the container of mixed spray solution regularly during application to maintain an adequate suspension.
