DIRECTIONS FOR USE

It is a violation of Federal law to use this product in a manner inconsistent with its labeling.

INSTRUCTIONS FOR USE

NOMATE CM Spiral is intended to prevent damage to pome fruit and walnuts caused by codling moth. The product functions by disrupting the mating communication between the sexes of the adult moths. By interfering with the natural mating process, fertile egg laying and subsequent larval infestation can be suppressed, thus reducing the need for conventional insecticides. Reduction in the use of conventional insecticides permits an increase in the populations of parasites and predators which assist in the biological control of other pests.

RATE OF APPLICATION

The recommended rate of application is 500-1,000 spirals per acre (1,250-2,500 spirals per hectare).

METHOD OF APPLICATION

NOMATE CM Spiral is applied directly by wrapping the spiral around stems or branches. Open the container just prior to application. Reseal unused product and refrigerate.

Apply the product to the upper portion of the canopy whenever possible. Also, the spirals should be placed at least 1 to 2 feet within the canopy.

For maximum effectiveness, it may be necessary to increase density of dispenser placement around the orchard perimeter.

TIMING OF APPLICATION

Monitor, using the "wing style" traps and Scentry® CM pheromone lures, to determine the time of application. Trap placement should begin at early petal fall to determine first flight and should continue throughout the season to help assess treatment effectiveness.

The application of NOMATE CM Spiral should occur within 2 to 3 days after the first male moth is captured in a trap. Prediction Day Degree Models can provide assistance in determining application timing. Model information and economic thresholds that may vary from geographical regions are available from your county Farm Advisor.
