CONTAINER DISPOSAL: Completely empty bag into application equipment. Then dispose of empty bag in a sanitary landfill or by incineration, or, if allowed by State and local authorities, by burning. If burned, stay out of smoke.

This product is a preemergence herbicide for use in controlling crabgrass, creeping bentgrass, smart weed, dandelions, redroot bigweed, purslane, lambsquarter, foxtail, barnyard grass, and Bermuda grass. A preemergence herbicide is capable of controlling weeds only at the time of germination. There is no post-emergence activity from A-Maizing Lawn. Any weeds which have germinated before application of A-Maizing Lawn will not be controlled.

DIRECTIONS FOR USE:

Use on turfgrasses as a preemergence herbicide. DO NOT use on grass which as recently been sown. (Apply anytime after first mowing.) The cool weather of spring and fall creates two prime germination periods for perennial, broadleaf, and grassy weeds. The fall germination period is often overlooked in spite of the fact that dandelions and many other weeds germinate readily in favorable fall conditions, establishing themselves for rapid growth and flowering the following spring.

SPRING APPLICATION

For crabgrass and other spring germinating weeds, apply 20 lbs. per 1,000 sq. ft. at the time forsythia begins to bloom in your area. As an alternate timing guide, apply when crocuses have finished blooming or when the first daffodils or jonquils begin to bloom. (To use bulb blooming times as a guide, bulbs must be located 15 ft. or more away from any foundation.)

FALL APPLICATION

For dandelions and other fall germinating weeds, apply 20 lbs. per 1000 sq. ft. following the hot, dry stress period of mid-summer. In

1045
most regions, application time would be from August 15th to September 15th.

Although rains usually provide adequate moisture, you may want to water in A-Maizing Lawn following application. If you do water, water deeply and infrequently, allowing the soil surface to dry. To be most effective, A-Maizing Lawn requires a drying period. The soil surface should not be continuously wet. (As would be the case with automatic irrigation systems.)

How It Works:

Through an inhibitory process, which we do not yet fully understand, the Maize Gluten Meal in A-Maizing Lawn stops root development of germinating seeds. Since A Maizing Lawn is an effective herbicide on a wide range of seeds, it is important to allow desired plants to become established before applying A-Maizing Lawn. Over-application, up to 40 lbs. per 1,000 sq. ft., will not harm your grass. In fact, the percentage of weed control increases as the application rate increases (up to 40 lbs./1,000 sq. ft.).

What It Is:

Maize Gluten Meal is a by-product of the wet milling process of making corn starch or corn syrup. Maize Gluten Meal is 60% protein and is widely used as a food ingredient for fish, poultry, horses, cattle, and in pet food. As A-Maizing Lawn decomposes, it makes nitrogen available to established grass. As a result, you should reduce or eliminate regular fertilization programs for at least 6 to 8 weeks after application of A-Maizing Lawn. If fertilization is to be applied at the same time as A-Maizing Lawn, the fertilizer should be low in nitrogen and higher in phosphorous and potassium.

There are no re-entry restrictions following use of A-Maizing Lawn. People, pets, and animals may use the lawn immediately following application.
