

U.S. ENVIRONMENTAL PROTECTION AGENCY

Office of Pesticide Programs
Biopesticides and Pollution Prevention Division (7511P)
1200 Pennsylvania Avenue NW
Washington, D.C. 20460

Registration Number:

EPA

Date of Issuance:

67979-13

DEC 2 2 2011

Term of Issuance:

Conditional, Time Limited

Name of Pesticide Product:

Bt11 x MIR162 x MIR604 corn

NOTICE OF PESTICIDE:

X Registration
Reregistration

(under FIFRA, as amended)

Name and Address of Registrant (include ZIP Code):

Syngenta Seeds, Inc. - Field Crops - NAFTA

3054 East Cornwallis Road

P.O. Box 12257

Research Triangle Park, NC 27709-2257

Note: Changes in labeling, differing in substance from that accepted in connection with this registration, must be submitted to and accepted by the Biopesticides and Pollution Prevention Division prior to use of the label in commerce. In any correspondence on this product, always refer to the above EPA Registration Number.

On the basis of information furnished by the registrant, the above named pesticide is hereby registered/reregistered under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA or the Act). Registration is in no way to be construed as an endorsement or recommendation of this product by the Environmental Protection Agency (EPA or the Agency). In order to protect health and the environment, the Administrator, on his or her motion, may at any time suspend or cancel the registration of a pesticide in accordance with the Act. The acceptance of any name in connection with the registration of a product under this Act is not to be construed as giving the registrant a right to exclusive use of the name or to its use if it has been covered by others.

This product is conditionally registered in accordance with FIFRA section 3(c)(7)(A) provided that you comply with the following terms and conditions:

- 1) The subject registration will automatically expire at midnight on December 31, 2013.
- 2) The subject registration will be limited to Cry1Ab [Bacillus thuringiensis Cry1Ab delta-endotoxin protein and the genetic material necessary for its production (via elements of vector pZO1502) in corn event Bt11 (OECD Unique Identifier: SYN-BTØ11-1)] x Vip3Aa20 [Bacillus thuringiensis Vip3Aa20 insecticidal protein and the genetic material necessary for its production (via elements of vector pNOV1300) in corn event MIR162 (OECD Unique Identifier: SYN-IR162-4)] x mCry3A [Bacillus thuringiensis mCry3A protein and the genetic material necessary for its production (via elements of vector pZM26) in corn event MIR604 (OECD Unique Identifier: SYN-IR6Ø4-5)] for use in field corn.

MARTIN

DATE 12/22/2611 22/54/11

- 3) Submit/cite all data required for registration of your product under FIFRA section 3(c)(5) when the Environmental Protection Agency (EPA) requires registrants of similar products to submit such data.
- 4) Submit/cite all data and/or information, which are required to support individual plant-incorporated protectants in YieldGard® Insect Resistant Corn, MIR162 maize, and Agrisure® RW Rootworm-Protected Corn within the time frames required by the terms and/or conditions of EPA Registration Numbers 67979-1, 67979-14, and 67979-5, respectively. These data and/or information must be determined by EPA to be acceptable.
- 5) This plant-incorporated protectant may be combined through conventional breeding with other registered plant-incorporated protectants that are similarly approved for use in combination, through conventional breeding, with other registered plant-incorporated protectants to produce inbred corn lines and hybrid corn varieties with combined pesticidal traits.
- 6) You must submit the following data and/or information in the time frames listed:

Study Type	Required Data/Information	Due Date
Insect Resistance Management – Grower Agreement	A copy of the grower agreement, associated stewardship documents, and written description of a system, which assure that growers will sign grower agreements and persons purchasing Bt11 x MIR162 x MIR604 corn will annually affirm that they are contractually bound to comply with the requirements of the insect resistance management (IRM) program, must be submitted.	March 30, 2012
Insect Resistance Management – Compliance	A revised compliance assurance program (CAP) to address the items in section 7(c) (paragraphs 16–22) of this registration notice.	March 30, 2012

- 7) You must commit to do the following IRM Program, consisting of the following elements:
 - Requirements relating to creation of a refuge for the Cry1Ab, Vip3Aa20, and mCry3A components that meets the requirements of the individual traits. The refuge for these traits may be combined by planting non-Bacillus thuringiensis (Bt) corn as the refuge, or the refuge for each trait may be planted separately. In the latter case, corn rootworm-resistant Bt corn may be planted in the lepidopteran refuge for the Cry1Ab and Vip3Aa20 components, and lepidopteran-resistant Bt corn may be planted in the corn rootworm refuge for the mCry3A component.
 - Requirements for Syngenta Seeds, Inc. Field Crops NAFTA (Syngenta) to prepare and
 require Bt11 x MIR162 x MIR604 corn users to sign grower agreements that impose binding
 contractual obligations on growers to comply with the refuge requirements.

- Requirements for Syngenta to develop, implement, and report to EPA on programs to educate growers about IRM requirements.
- Requirements for Syngenta to develop, implement, and report to EPA on programs to evaluate and promote growers' compliance with IRM requirements.
- Requirements for Syngenta to develop, implement, and report to EPA on monitoring programs to
 evaluate whether there are statistically significant and biologically relevant changes in
 susceptibility to the Cry1Ab, Vip3Aa20, and/or mCry3A proteins in the target insects.
- Requirements for Syngenta to develop, and if triggered, to implement a remedial action plan that
 would contain measures Syngenta would take in the event that any field-relevant insect resistance
 was detected, as well as to report on activity under the plan to EPA.
- Requirements for Syngenta, on or before January 31st of each year, to submit reports on units sold by state (units sold by county level will made available to EPA upon request), IRM grower agreement results, and the compliance assurance program, including the education program.
- Requirements for Syngenta, on or before August 31st of each year, to submit reports on resistance monitoring.

a. Refuge Requirements for Bt11 x MIR162 x MIR604 Corn

These refuge requirements do not apply to seed increase/propagation of inbred and hybrid seed corn up to a total of 20,000 acres per county and up to a combined United States total of 250,000 acres per plant-incorporated protectant active ingredient per registrant per year.

When on-farm assessments identify non-compliance with refuge requirements for one or more *Bt* corn products, additional educational material and assistance will be provided by Syngenta to help these growers meet the refuge requirements across their farming operations.

Grower agreements (also known as stewardship agreements) will specify that growers must adhere to the refuge requirements as described in the grower guide/product use guide and/or in supplements to the grower guide/product use guide.

For Bt11 x MIR162 x MIR604 corn, two options for deployment of the refuge are available to growers.

The first option is planting a <u>common refuge</u> for both corn borers and corn rootworms. The common refuge must be planted with corn hybrids that do not contain *Bt* technologies for the control of corn borers or corn rootworms. The common refuge area must represent at least 20% of the grower's corn

acres (i.e., sum of Bt11 x MIR162 x MIR604 corn acres and common refuge acres). It must be planted as a block adjacent to the Bt11 x MIR162 x MIR604 corn field, perimeter strips (i.e., strips around the field), or in-field strips. If perimeter or in-field strips are implemented, the strips must be at least 4 consecutive rows wide. If the common refuge is planted on rotated ground, then Bt11 x MIR162 x MIR604 corn must also be planted on rotated ground. If the common refuge is planted in continuous corn, the Bt11 x MIR162 x MIR604 corn field may be planted on either continuous or rotated land. The common refuge can be treated with a soil-applied or seed-applied insecticide to control corn rootworm larvae and other soil pests. The common refuge can also be treated with a non-Bt foliar insecticide for control of late season pests, if pest pressure reaches an economic threshold for damage; however, if corn rootworm adults are present at the time of foliar applications, then the Bt11 x MIR162 x MIR604 corn field must be treated in a similar manner. Economic thresholds will be determined using methods recommended by local or regional professionals (e.g., Extension Service agents or crop consultants). Pests other than adult corn rootworms can be treated with an appropriate pest-labeled insecticide on the common refuge acres without treating the Bt11 x MIR162 x MIR604 corn acres only if treatment occurs when adult corn rootworms are not present. Pests on the Bt11 x MIR162 x MIR604 corn acres can be treated as needed without having to treat the common refuge.

The second option is planting separate refuge areas for corn borers and corn rootworms. The corn borer refuge must be planted with corn that is not a lepidopteran-protected Bt hybrid, must represent at least 20% of the grower's corn acres (i.e., sum of Bt11 x MIR162 x MIR604 corn acres and corn borer refuge acres), and must be planted within ½ mile of the Bt11 x MIR162 x MIR604 corn field. Refuge planting options include separate fields, blocks within fields (e.g., along the edges or headlands), perimeter strips (i.e., strips around the field), or in-field strips. If perimeter or in-field strips are implemented, the strips must be at least 4 consecutive rows wide. The corn borer refuge can be treated with a soil-applied or seed-applied insecticide for corn rootworm larval control or a non-Bt foliar-applied insecticide for corn borer control, if pest pressure reaches an economic threshold for damage. Economic thresholds will be determined using methods recommended by local or regional professionals (e.g., Extension Service agents or crop consultants).

The corn rootworm refuge must be planted with corn that is not a corn rootworm-protected *Bt* hybrid, must represent at least 20% of the grower's corn acres (i.e., sum of Bt11 x MIR162 x MIR604 corn acres and corn rootworm refuge acres), and must be planted as an adjacent block, perimeter strips (i.e., strips around the field), or in-field strips. If perimeter or in-field strips are implemented, the strips must be at least 4 consecutive rows wide. If the corn rootworm refuge is planted on rotated ground, then Bt11 x MIR162 x MIR604 corn must also be planted on rotated ground. If the corn rootworm refuge is planted in continuous corn, the Bt11 x MIR162 x MIR604 corn field may be planted on either continuous or rotated land. More generally, the corn rootworm refuge should utilize comparable agronomic practices as the Bt11 x MIR162 x MIR604 corn acres. The corn rootworm refuge can be treated with a soil-applied or seed-applied insecticide to control corn rootworm larvae and other soil pests. The corn rootworm refuge can also be treated with a non-*Bt* foliar insecticide for control of late season pests, if pest pressure

reaches an economic threshold for damage; however, if corn rootworm adults are present at the time of foliar applications, then the Bt11 x MIR162 x MIR604 corn field must be treated in a similar manner. Economic thresholds will be determined using methods recommended by local or regional professionals (e.g., Extension Service agents or crop consultants). Pests other than adult corn rootworms can be treated with an appropriate pest-labeled insecticide on the corn rootworm refuge acres without treating the Bt11 x MIR162 x MIR604 corn acres only if treatment occurs when adult corn rootworms are not present or if a pesticide without activity against adult corn rootworms is used. Pests on the Bt11 x MIR162 x MIR604 corn acres can be treated as needed without having to treat the corn rootworm refuge.

b. Grower Agreements for Bt11 x MIR162 x MIR604 Corn

- 1) Persons purchasing Bt11 x MIR162 x MIR604 corn must sign a grower agreement. The term grower agreement refers to any grower purchase contract, license agreement, or similar legal document.
- 2) The grower agreement and/or specific stewardship documents referenced in the grower agreement must clearly set forth the terms of the current IRM program. By signing the grower agreement, a grower must be contractually bound to comply with the requirements of the IRM program.
- 3) Syngenta must continue to implement a system, which is reasonably likely to assure that persons purchasing Bt11 x MIR162 x MIR604 corn will affirm annually that they are contractually bound to comply with the requirements of the IRM program.
- 4) Syngenta must continue to use its current grower agreement for Bt11 x MIR162 x MIR604 corn. If Syngenta wishes to change any part of the grower agreement or any specific stewardship documents referenced in the grower agreement that would affect either the content of the IRM program or the legal enforceability of the provisions of the agreement relating to the IRM program, thirty (30) days prior to implementing a proposed change, Syngenta must submit to EPA the text of such changes to ensure that it is consistent with the terms and conditions of this registration.
- 5) Syngenta must continue to implement an approved system, which is reasonably likely to assure that persons purchasing Bt11 x MIR162 x MIR604 corn sign grower agreement(s).
- 6) Syngenta shall maintain records of all Bt11 x MIR162 x MIR604 corn grower agreements for a period of three (3) years from December 31st of the year in which the agreement was signed.
- 7) Annually, Syngenta shall provide EPA with a report showing the number of units of Bt11 x MIR162 x MIR604 corn seeds sold or shipped and not returned, and the number of such units that were sold to persons who have signed grower agreements. The report shall cover the time frame of the 12-month period covering the prior August through July.

8) Syngenta must allow a review of the grower agreements and grower agreement records by EPA or by a State pesticide regulatory agency if the State agency can demonstrate that confidential business information, including names, personal information, and grower license numbers of the growers, will be protected.

c. IRM Education and Compliance Monitoring Programs for Bt11 x MIR162 x MIR604 Corn

- 1) Syngenta must continue to implement and enhance (as set forth in paragraph 17 of this section) a comprehensive, ongoing IRM education program designed to convey to Bt11 x MIR162 x MIR604 corn users the importance of complying with the IRM program. The program shall include information encouraging Bt11 x MIR162 x MIR604 corn users to pursue optional elements of the IRM program relating to refuge configuration and proximity to Bt11 x MIR162 x MIR604 corn fields. The education program shall involve the use of multiple media (e.g., face-to-face meetings, mailing written materials, EPA-reviewed language on IRM requirements on the bag or bag tag, and electronic communications such as by Internet, radio, or television commercials). Copies of the materials will be provided to EPA for its records. The program shall involve at least one (1) written communication annually to each Bt11 x MIR162 x MIR604 corn user separate from the grower technical guide. The communication shall inform the user of the current IRM requirements. Syngenta shall coordinate its education programs with educational efforts of other registrants and organizations, such as the National Corn Growers Association and state extension programs.
- 2) Annually, Syngenta shall revise, and expand as necessary, its education program to take into account the information collected through the compliance survey, required under paragraphs 6–8 of this section, and from other sources. The changes shall address aspects of grower compliance that are not sufficiently high.
- 3) Annually, Syngenta must provide EPA any substantive changes to its grower education activities as part of the overall IRM compliance assurance program report. Syngenta must either submit a separate report or contribute to the report from the industry working group, Agricultural Biotechnology Stewardship Technical Committee (ABSTC). The required features of the compliance assurance program are described in paragraphs 4–22 of this section.
- 4) Syngenta must continue to implement and improve an ongoing IRM compliance assurance program designed to evaluate the extent to which growers purchasing Bt11 x MIR162 x MIR604 corn are complying with the IRM program and that takes such actions as are reasonably needed to assure that growers who have not complied with the program either do so in the future or lose their access to Syngenta's Bt corn products. Syngenta shall coordinate with other Bt corn registrants in improving its compliance assurance program and continue to integrate this registration into the current compliance assurance program used for its other Bt corn plant-incorporated protectants. Other required features of

the program are described in paragraphs 5-22 of this section.

- 5) Syngenta must maintain and publicize a phased compliance approach (i.e., a guidance document that indicates how it will address instances of non-compliance with the terms of the IRM program and general criteria for choosing among options for responding to any non-compliant growers after the first year of non-compliance). While recognizing that, for reasons of difference in business practices, there are needs for flexibility between different companies, Syngenta must use a consistent set of standards for responding to non-compliance. An individual grower found to be significantly out of compliance two (2) years in a row would be denied access to Syngenta's *Bt* corn products the next year. Similarly, seed dealers who are not fulfilling their obligations to inform/educate growers of their IRM obligations will lose their opportunity to sell *Bt* corn.
- 6) The IRM compliance assurance program shall include an annual survey, conducted by an independent third party, of a statistically representative sample of growers of Bt11 x MIR162 x MIR604 corn who plant the vast majority of all corn in the United States and in areas in which the selection intensity is greatest. The survey shall consider only those growers who plant 200 or more acres of corn in the Corn Belt and who plant 100 or more acres of corn in corn-cotton areas. The survey shall measure the degree of compliance with the IRM program by growers in different regions of the country and consider the potential impact of non-response. The sample size and geographical resolution may be adjusted annually, based upon input from independent marketing research firms and academic scientists, to allow analysis of compliance behavior within regions or between regions. The sample size must provide a reasonable sensitivity for comparing results across the United States. A third party is defined as a party other than Syngenta, the grower, or anyone else with a direct interest in IRM compliance for *Bt* corn.
- 7) The survey shall be designed to provide an understanding of any difficulties growers encounter in implementing IRM requirements. An analysis of survey results must include the reasons, extent, and potential biological significance of any implementation deviations.
- 8) The survey shall be designed to obtain grower feedback on the usefulness of specific educational tools and initiatives.
- 9) Syngenta shall provide a final written summary of the results of the prior year's survey (together with a description of the regions, the methodology used, and the supporting data) to EPA, on or before January 31st of each year. Syngenta shall confer with other registrants and EPA on the design and content of the survey prior to its implementation.
- 10) Annually, Syngenta shall revise, and expand as necessary, its compliance assurance program to take into account the information collected through the compliance survey, required under paragraphs 6–8 of this section, and from other sources. The changes shall address aspects of grower compliance that are not

sufficiently high. Syngenta must confer with EPA prior to adopting any changes.

- 11) Syngenta shall conduct an annual on-farm assessment program. Syngenta shall train its representatives who make on-farm visits with Bt11 x MIR162 x MIR604 corn growers to perform assessments of compliance with IRM requirements. There is no minimum corn acreage size for this program. Therefore, growers will be selected for this program from across all farm sizes. In the event that any of these visits result in the identification of a grower who is not in compliance with the IRM program, Syngenta shall take appropriate action, consistent with its phased compliance approach, to promote compliance.
- 12) Syngenta shall carry out a program for investigating legitimate tips and complaints that Bt11 x MIR162 x MIR604 corn growers are not in compliance with the IRM program. Whenever an investigation results in the identification of a grower who is not in compliance with the IRM program, Syngenta shall take appropriate action, consistent with its phased compliance approach.
- 13) If a grower, who purchases Bt11 x MIR162 x MIR604 corn for planting, was specifically identified as not being in compliance during the previous year, Syngenta shall visit with the grower and evaluate whether the grower is in compliance with the IRM program for the current year.
- 14) Annually, Syngenta shall provide a report to EPA summarizing the activities carried out under its compliance assurance program for the prior year and the plans for the compliance assurance program during the current year. Within one (1) month of submitting this report to EPA, Syngenta shall meet with EPA to discuss its findings. The report will include information regarding grower interactions (including, but not limited to, on-farm visits, verified tips and complaints, grower meetings and letters), the extent of non-compliance, corrective measures to address the non-compliance, and any follow-up actions taken. The report must inform EPA of the number of growers deemed ineligible to purchase *Bt* corn seed on the basis of continued non-compliance with the insect resistance management refuge requirements. Syngenta may elect to coordinate information with other registrants and report collectively the results of compliance assurance programs.
- 15) Syngenta and the seed corn dealers for Syngenta must allow a review of the compliance records by EPA or by a State pesticide regulatory agency if the State agency can demonstrate that confidential business information, including the names, personal information, and grower license numbers of the growers, will be protected.
- 16) Syngenta shall revise and expand its existing compliance assurance program to include the following elements. Syngenta must prepare and submit, on or before March 30, 2012, a written description of its revised compliance assurance program. Syngenta may coordinate with other registrants in designing and implementing its compliance assurance program.

- 17) Syngenta will enhance the refuge education program throughout the seed delivery channel:
 - i. Ensure sales representatives, licensees, seed dealers, and growers recognize the importance of correct refuge implementation and potential consequences of failure to plant the required refuge.
 - ii. Include the refuge size requirement on all Bt11 x MIR162 x MIR604 corn seed bags or bag tags. The Bt11 x MIR162 x MIR604 corn label accepted by EPA must include how this information will be conveyed to growers via text and graphics. This requirement may be phased in over the next three (3) growing seasons. Revised Bt11 x MIR162 x MIR604 corn labels must be submitted by March 30, 2012, 50% implementation on the Bt11 x MIR162 x MIR604 corn bags or bag tags must occur by the 2013 growing season, and full implementation must occur by the 2014 growing season.
- 18) Syngenta will focus the majority of on-farm assessments on regions with the greatest risk for resistance:
 - i. Use *Bt* corn adoption, pest pressure information, and other available information to identify regions where the risk of resistance is greatest.
 - ii. Focus approximately two-thirds of on-farm assessments on these regions, with the remaining assessments conducted across other regions where Bt11 x MIR162 x MIR604 corn is used.
- 19) Syngenta will use its available Bt11 x MIR162 x MIR604 corn sales records and other information to refine grower lists for on-farm assessments of their compliance with refuge requirements:
 - i. Identify for potential on-farm assessment growers whose sales information indicates they have purchased Bt11 x MIR162 x MIR604 corn but may have purchased little or no refuge seed from Syngenta, licensees, or affiliated companies.
- 20) Syngenta will contract with third parties to perform on-farm assessments of compliance with refuge requirements:
 - i. The third-party assessors will conduct all first-time on-farm assessments, as well as second-year on-farm assessments, of those growers found out of compliance in a first-time assessment.

- 21) Annually, Syngenta will refine the on-farm assessment program for Bt11 x MIR162 x MIR604 corn to reflect the adoption rate and level of refuge compliance for Bt11 x MIR162 x MIR604 corn.
- 22) Syngenta will follow up with growers who have been found significantly out of compliance under the on-farm assessment program and are found to be back in compliance the following year:
 - i. All growers found to be significantly out of compliance in a prior year will annually be sent additional refuge assistance information for a minimum of two (2) years by Syngenta, a seed supplier, or a third-party assessor, after completing the assessment process.
 - ii. Syngenta will conduct follow-up checks on growers found to be significantly out of compliance within three (3) years after they are found to be back in compliance.
 - iii. A grower found with a second incident of significant non-compliance with refuge requirements for Bt11 x MIR162 x MIR604 corn within a 5-year period will be denied access to Syngenta's Bt corn products the next year.

d. Insect Resistance Monitoring and Remedial Action Plans for Bt11 x MIR162 x MIR604 Corn

- 1) EPA is imposing the following conditions for the mCry3A toxin expressed in Bt11 x MIR162 x MIR604 corn:
 - i. Syngenta must monitor for mCry3A resistance and/or trends in increased tolerance for corn rootworm. Sampling should be focused in those areas in which there is the highest risk of resistance development. EPA recognizes that the resistance monitoring submission requirements, described in paragraphs ii—v, may have been fulfilled with submissions for other Syngenta registrations containing mCry3A.
 - ii. The resistance monitoring plan must include the following: baseline sensitivity data, sampling (number of locations, samples per locations), sampling methodology and life stage sampled, bioassay methodology, standardization procedures (including quality assurance/quality control provisions), detection technique and sensitivity, statistical analysis of the probability of detecting resistance, and a revised description of rootworm damage guidelines.
 - iii. Syngenta must develop a functional diagnostic assay for corn rootworm resistance monitoring to detect potentially resistant individuals and incorporate this assay into the annual resistance monitoring program by the 2012 season, with reporting in 2013. As part of this effort, Syngenta must investigate the feasibility of using the Sublethal Seedling Assay (Nowatzki *et al.* 2008) as a diagnostic assay.

- iv. Syngenta must develop a proactive resistance monitoring program for northern corn rootworm (*Diabrotica barberi*) by the 2012 season, with reporting in 2013. This program should include a proposal for annual sampling and testing of northern corn rootworm susceptibility to mCry3A. As part of the effort, Syngenta may need to investigate novel techniques for rearing and conducting bioassays with northern corn rootworm.
- v. Syngenta must submit revised corn rootworm damage guidelines (to characterize unexpected pest damage). The revised guidelines must take into consideration the comments and recommendations from EPA's June 30, 2010 review of the rootworm resistance monitoring program for mCry3A.
- vi. Syngenta must follow-up on grower, extension specialist, or consultant reports of unexpected damage or control failures for corn rootworm.
- vii. Syngenta must provide EPA with a resistance monitoring report on or before August 31st of each year, reporting on populations collected the previous year.
- viii. The following program summary describes, in order or events, the steps that must be taken to implement a remedial action plan if resistance to corn rootworm is confirmed (this general process has been implemented for other lepidopteran and corn rootworm *Bt* corn products).
 - 1. Definition of Suspected Resistance. Resistance will be suspected if investigations of unexpected damage reports show that:
 - implicated maize plant roots were expressing the mCry3A protein at the expected level;
 - alternative causes of damage or lodging, such as nontarget pest insect species, weather, physical damage, larval movement from alternate hosts, planting errors, and other reasonable causes for the observations, have been ruled out;
 - the level of damage exceeds guidelines for expected damage.

If resistance is suspected, Syngenta will instruct affected growers to use alternate pest control measures such as adulticide treatment, crop rotation the following year, or use of soil or seed insecticides the following year. These measures are intended to reduce the possibility of potentially resistant insects contributing to the following year's pest population.

- 2. Confirmation of Resistance. Resistance will be confirmed if all of the following criteria are met by progeny from the target pest species sampled from the area of suspected resistance:
 - the proportion of larvae that can feed and survive on mCry3A roots from neonate to adult is significantly higher than the baseline proportion (currently being established);
 - the LC₅₀ of the test population exceeds the upper limit of the 95% confidence interval for the LC₅₀ of a standard unselected population and/or survival in the diagnostic assay is significantly greater than that of a standard unselected population, as established by the ongoing baseline monitoring program;
 - the ability to survive is heritable;
 - mCry3A plant assays determine that damage caused by surviving insects would exceed economic thresholds; and
 - the identified frequency of field resistance could lead to widespread product failure if subsequent collections in the affected field area(s) demonstrated similar bioassay results.
- 3. Response to Confirmed Resistance. When resistance is confirmed, the following steps will be taken:
 - EPA will receive notification within thirty (30) days of resistance confirmation;
 - affected customers and extension agents will be notified about confirmed resistance;
 - affected customers and extension agents will be encouraged to employ alternative corn rootworm control measures;

- sale and distribution of mCry3A corn in the affected area will cease immediately; and
- a long-term resistance management action plan will be devised according to the characteristics of the resistance event and local agronomic needs.
 [The details of such a plan should be approved by approved by EPA and all appropriate stakeholders.]

2) EPA is imposing the following conditions for the Cry1Ab and Vip3Aa20 toxins expressed in Bt11 x MIR162 x MIR604 corn:

Syngenta will monitor for resistance to the Cry1Ab and Vip3Aa20 toxins expressed in Bt11 x MIR162 x MIR604 corn. The monitoring program shall consist of two approaches: (1) focused population sampling and laboratory testing and (2) investigation of reports of less-than expected control of labeled insects. Should field-relevant resistance be confirmed, an appropriate resistance management action plan will be implemented.

Focused Population Sampling

Syngenta shall annually sample and bioassay populations of the key target pests: Ostrinia nubilalis (European corn borer; ECB), Diatraea grandiosella (southwestern corn borer; SWCB), and Helicoverpa zea (corn earworm; CEW). Sampling for the target pests will be focused in areas identified as those with the highest risk of resistance development (e.g., where lepidopteran-active Bt hybrids are planted on a high proportion of the corn acres, and where the insect species are regarded as key pests of corn). Bioassay methods must be appropriate for the goal of detecting field-relevant shifts in population response to Bt11 x MIR162 x MIR604 corn and/or changes in resistance allele frequency in response to the use of Bt11 x MIR162 x MIR604 corn and, as far as possible, should be consistent across sampling years to enable comparisons with historical data. Monitoring for ECB is not required for the Vip3Aa20 toxin, since it is not active against this insect.

The number of populations to be collected shall reflect the regional importance of the insect species as a pest, and specific collection regions will be identified for each pest. For ECB, a minimum of twelve (12) populations across the sampling region will be targeted for collection at each annual sampling. For SWCB, the target will be a minimum of six (6) populations. For CEW, the target will be a minimum of ten (10) populations. Pest populations should be collected from multiple corn-growing states reflective of different geographies and agronomic conditions. To obtain sufficient sensitivity to detect resistance alleles before they become common enough to cause measurable field damage, each population collection shall attempt to target 400 insect genomes (egg masses, larvae, mated females, and/or mixed-sex adults), but a successful population collection will contain a minimum of 100 genomes. It is

recognized that it may not be possible to collect the target number of insect populations or genomes due to factors such as natural fluctuations in pest density, environmental conditions, and area-wide pest suppression.

The sampling program and geographic range of collections may be modified as appropriate based on changes in pest importance and for the adoption levels of Bt11 x MIR162 x MIR604 corn. EPA shall be consulted prior to the implementation of such modifications.

Syngenta will report to EPA, on or before August 31st of each year, the results of the population sampling and bioassay monitoring program.

Any incidence of unusually low sensitivity to the Cry1Ab and/or Vip3Aa20 proteins in bioassays shall be investigated as soon as possible to understand any field relevance of such a finding. Such investigations shall proceed in a stepwise manner until the field relevance can be either confirmed or refuted, and results of these shall be reported to EPA annually on or before August 31st. The investigative steps will include the following:

- 1. Re-test progeny of the collected population to determine whether the unusual bioassay response is reproducible and heritable. If it is not reproducible and heritable, no further action is required.
- 2. If the unusual response is reproducible and heritable, progeny of insects that survive the diagnostic concentration will be tested using methods that are representative of exposure to Bt11 x MIR162 x MIR604 corn under field conditions. If progeny do not survive to adulthood, any suspected resistance is not field relevant and no further action is required.
- 3. If insects survive steps 1 and 2, resistance is confirmed, and further steps will be taken to evaluate the resistance. These steps may include the following:
 - determining the nature of the resistance (i.e., recessive or dominant, and the level of functional dominance);
 - estimating the resistance allele frequency in the original population;
 - determining whether the resistance-allele frequency is increasing by analyzing field collections in subsequent years sampled from the same site where the resistance allele(s) was originally collected;

> determining the geographic distribution of the resistance allele by analyzing field collections in subsequent years from sites surrounding the site where the resistance allele(s) was originally collected.

Should field-relevant resistance be confirmed, and the resistance appears to be increasing or spreading, Syngenta will consult with EPA to develop and implement a case-specific resistance management action plan.

Investigation of Reports of Unexpected Levels of Damage by the Target Pests

Syngenta will follow up on grower, extension specialist, or consultant reports of unexpected levels of damage by the lepidopteran pests listed on the pesticide label. Syngenta will instruct its customers to contact them if such incidents occur. Syngenta will investigate all legitimate reports submitted to the company or the company's representatives.

If reports of unexpected levels of damage lead to the suspicion of resistance in any of the key target pests (ECB, SWCB, and CEW), Syngenta will implement the actions described below, based on the following definitions of *suspected resistance* and *confirmed resistance*.

Suspected Resistance

EPA defines *suspected resistance* to mean field reports of unexpected levels of insect-feeding damage for which:

- the corn in question has been confirmed to be lepidopteran-active Bt corn;
- the seed used had the proper percentage of corn expressing Bt protein;
- the relevant plant tissues are expressing the expected level of Bt protein; and
- it has been ruled out that species not susceptible to the protein could be responsible for the damage, that no climatic or cultural reasons could be responsible for the damage, and that that there could be no other reasonable causes for the damage.

EPA does not interpret *suspected resistance* to mean grower reports of possible control failures or suspicious results from annual insect monitoring assays, nor does EPA intend that extensive field studies and testing be undertaken to confirm scientifically the presence of insects resistant to Bt11 x MIR162 x MIR604 corn in commercial production fields before responsive measures are undertaken.

If resistance is suspected, Syngenta will instruct growers to do the following:

- Use alternative control measures in Bt11 x MIR162 x MIR604 corn fields in the affected region to control the target pest during the immediate growing season.
- Destroy Bt11 x MIR162 x MIR604 corn crop residues in the affected region within one (1) month after harvest with a technique appropriate for local production practices to minimize the possibility of resistant insects over-wintering and contributing to the next season's target pest population.

Additionally, if possible, and prior to the application of alternative control measures or destruction of crop residues, Syngenta will collect samples of the insect population in the affected fields for laboratory rearing and testing. Such rearing and testing shall be conducted as expeditiously as practical.

Confirmed Resistance

EPA defines *confirmed resistance* to mean, in the case of field reports of unexpected levels of damage from the key target pests, that all of the following criteria are met:

- There is >30% insect survival and commensurate insect feeding in a bioassay, initiated with neonate larvae, that uses methods that are representative of exposure to *Bt* corn hybrids under field conditions (ECB and SWCB only).
- In standardized laboratory bioassays using diagnostic concentrations of the Bt protein suited to
 the target pest in question, the pest exhibits resistance that has a genetic basis and the level of
 survivorship indicates that there may be a resistance allele frequency of ≥ 0.1 in the sampled
 population.
- In standardized laboratory bioassays, the LC₅₀ exceeds the upper limit of the 95% confidence
 interval of the LC₅₀ for susceptible populations surveyed both in the original baselines developed
 for this pest species and in previous years of field monitoring.

Response to Confirmed Resistance in a Key Target Pest as the Cause of Unexpected Levels of Damage in the Field

When field resistance is *confirmed* (as defined above), the following steps will be taken by Syngenta:

• EPA will receive notification within thirty (30) days of resistance confirmation;

- Affected customers and extension agents will be notified about confirmed resistance within thirty (30) days;
- Monitoring will be increased in the affected area and local target pest populations will be sampled annually to determine the extent and impact of resistance;
- If appropriate (depending on the resistant pest species, the extent of resistance, the timing of
 resistance, and the nature of resistance, and the availability of suitable alternative control
 measures), alternative control measures will be employed to reduce or control target pest
 populations in the affected area. Alternative control measures may include advising customers
 and extension agents in the affected area to incorporate crop residues into the soil following
 harvest to minimize the possibility of over-wintering insects, and/or applications of chemical
 insecticides;
- Unless otherwise agreed with EPA, stop sale and distribution of the relevant lepidopteran-active *Bt* corn hybrids in the affected area immediately until an effective local mitigation plan, approved by EPA, has been implemented;
- Syngenta will develop a case-specific resistance management action plan within ninety (90) days
 according to the characteristics of the resistance event and local agronomic needs. Syngenta will
 consult with appropriate stakeholders in the development of the action plan, and the details of
 such a plan shall be approved by EPA prior to implementation;
- Notify affected parties (e.g., growers, consultants, extension agents, seed distributors, university cooperators, and state/federal authorities as appropriate) in the region of the resistance situation and approved action plan; and
- In subsequent growing seasons, maintain sales suspension and alternative resistance management strategies in the affected region(s) for the *Bt* corn hybrids that are affected by the resistant population until an EPA-approved local resistance management plan is in place to mitigate the resistance.

A report on results of resistance monitoring and investigations of damage reports must be submitted to EPA, on or before August 31st of each year, for the duration of the registration.

e. Annual Reporting Requirements for Bt11 x MIR162 x MIR604 Corn

1) <u>Annual Sales</u>: reported and summed by state (county level data available by request), on or before January 31st of each year.

- 2) Grower Agreement Results: number of units of Bt11 x MIR162 x MIR604 corn seeds sold or shipped and not returned, and the number of such units that were sold to persons who have signed grower agreements, on or before January 31st of each year.
- 3) <u>Grower Education</u>: substantive changes to the education program completed during the previous year, on or before January 31st of each year.
- 4) <u>Compliance Assurance Program</u>: compliance assurance program activities and results for the previous year and plans for the compliance assurance program during the current year, on or before January 31st of each year.
- 5) <u>Compliance Assurance Program Survey Results</u>: survey results for the previous year and plans for the current year, on or before January 31st of each year.
- 6) <u>Insect Resistance Monitoring Results</u>: results of monitoring and investigations of damage reports, on or before August 31st of each year.

If these conditions are not complied with, the registration will be subject to cancellation in accordance with FIFRA section 6(e). Your release for shipment of this product constitutes acceptance of these conditions. A stamped copy of the label is enclosed for your records.

Sincerely,

Keith A. Matthews, Director Biopesticides and Pollution Prevention Division (7511P)

Bt11 x MIR162 x MIR604 Corn

[Alternate brand name: Agrisure[™] 3100]

Under the Federal Insecticide, Fungicide, and Rodenticide Act, as amended, for the pesticide registered under EPA Reg. No. 67979-13

OECD Unique Identifier: SYN-BTØ11-1 x SYN-IR162-4 x SYN-IR6Ø4-5

Plant-incorporated protectant: Cry1Ab, Vip3Aa20 and mCry3A proteins for control of corn borers, other lepidopteran pests and corn rootworms

This product is effective in controlling corn leaf, stalk, and ear damage caused by certain lepidopteran pests and root feeding damage caused by corn rootworms.

DIRECTIONS FOR USE

It is a violation of Federal law to use this product in a manner inconsistent with its labeling.

The subject registration will automatically expire at midnight on December 31, 2013.

This plant-incorporated protectant may be combined through conventional breeding with other registered plant-incorporated protectants that are similarly approved for use in combination, through conventional breeding, with other registered plant-incorporated protectants to produce inbred corn lines and hybrid corn varieties with combined pesticidal traits.

All maize seed that contains the plant-incorporated protectant sold or distributed by Syngenta Seeds, Inc. or its distributors must be accompanied by informational material (e.g., a bag tag) indicating the registration number (67979-13) and the active ingredients, and stipulating that growers read the Grower Guide (or equivalent guidance) prior to planting the seed.

> Important grower information. Please read before planting.

For more information, please refer to the Syngenta Stewardship guide

Insects Controlled or Suppressed

Field corn has been genetically transformed to produce the insecticidal proteins, Cry1Ab, Vip3Aa20 and mCry3A, for control or suppression of the following lepidopteran and coleopteran insects:

European corn borer (Ostrinia nubilalis) Southwestern corn borer (Diatraea grandiosella) Southern cornstalk borer (Diatraea crambidoides) Corn earworm (Helicoverpa zea) Fall armyworm (Spodoptera frugiperda)

Beet armyworm (Spodoptera exigua)

Black cutworm (Agrotis ipsilon)

Western bean cutworm (Striacosta albicosta)

Sugarcane borer (Diatraea saccharalis)

Western corn rootworm (Diabrotica virgifera virgifera)

Northern corn rootworm (Diabrotica barberi)

Mexican corn rootworm (Diabrotica virgifera zeae) Common stalk borer (Papaipema nebris) Dingy Cutworm (Feltia jaculifera)

Insect Resistance Management

These refuge requirements do not apply to seed increase/propagation of inbred and hybrid seed corn up to a total of 20,000 acres per county and up to a combined United States (U.S.) total of 250,000 acres per plant-incorporated protectant (PIP) active ingredient per registrant per year.

Refuge Requirements for Bt11 x MIR162 x MIR604 Corn

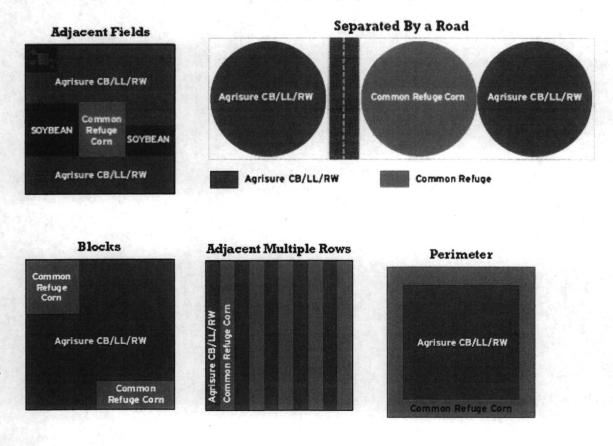

The following information regarding commercial production of Bt11 x MIR162 x MIR604 corn must be included in the Grower Guide (or equivalent).

Grower agreements (also known as stewardship agreements) will specify that growers must adhere to the refuge requirements as described in the grower guide/product use guide and/or in supplements to the grower guide/product use guide.

Two options for deployment of the refuge are available to growers.

The first option is planting a common refuge for both corn borers and corn rootworms. The common refuge must be planted with corn hybrids that do not contain Bt technologies for the control of corn rootworms or corn borers. The common refuge area must represent at least 20% of the grower's corn acres (i.e., sum of Bt11 x MIR162 x MIR604 corn acres and common refuge acres). It must be planted as a block adjacent to the Bt11 x MIR162 x MIR604 corn field, perimeter strips (i.e., strips around the field), or in-field strips. If perimeter or in-field strips are implemented, the strips must be at least 4 consecutive rows wide. If the common refuge is planted on rotated ground, then Bt11 x MIR162 x MIR604 corn must also be planted on rotated ground. If the common refuge is planted in continuous corn, the Bt11 x MIR162 x MIR604 corn field may be planted on either continuous or rotated land. The common refuge can be treated with a soil-applied or seed-applied insecticide to control corn rootworm larvae and other soil pests. The common refuge can also be treated with a non-Bt foliar insecticide for control of late season pests, if pest pressure reaches an economic threshold for damage; however, if corn rootworm adults are present at the time of foliar applications, then the Bt11 x MIR162 x MIR604 corn field must be treated in a similar manner. Economic thresholds will be determined using methods recommended by local or regional professionals (e.g., Extension Service agents or crop consultants). Pests other than adult corn rootworms can be treated with an appropriate pestlabeled insecticide on the common refuge acres without treating the Bt11 x MIR162 x MIR604 corn acres only if treatment occurs when adult corn rootworms are not present. Pests on the Bt11 x MIR162 x MIR604 corn acres can be treated as needed without having to treat the common refuge.

The following is a schematic of common refuge deployment options:

The second option is planting separate refuge areas for corn borers and corn rootworms. The corn borer refuge must be planted with corn that is not a lepidopteran-protected Bt hybrid, must represent at least 20% of the grower's corn acres (i.e., sum of Bt11 x MIR162 x MIR604 corn acres and corn borer refuge acres), and must be planted within ½ mile of the Bt11 x MIR162 x MIR604 corn field. Refuge planting options include separate fields, blocks within fields (e.g., along the edges or headlands), perimeter strips (i.e., strips around the field), or in-field strips. If perimeter or in-field strips are implemented, the strips must be at least 4 consecutive rows wide. The corn borer refuge can be treated with a soil-applied or seed-applied insecticide for corn rootworm larval control or a non-Bt foliar-applied insecticide for corn borer control, if pest pressure reaches an economic threshold for damage. Economic thresholds will be determined using methods recommended by local or regional professionals (e.g., Extension Service agents or crop consultants).

The corn rootworm refuge must be planted with corn that is not a corn rootworm-protected Bt hybrid, must represent at least 20% of the grower's corn acres (i.e., sum of Bt11 x MIR162 x MIR604 corn acres and corn rootworm refuge acres), and must be planted as an adjacent block, perimeter strips (i.e., strips around the field), or in-field strips. If perimeter or in-field strips are implemented, the strips must be at least 4 consecutive rows wide. If the corn rootworm refuge is planted on rotated ground, then Bt11 x MIR162 x MIR604 corn must also be planted on rotated ground. If the corn rootworm refuge is planted in continuous corn, the Bt11 x MIR162 x MIR604 corn field may be planted on either continuous or rotated land. More generally, the corn rootworm refuge should utilize comparable agronomic practices as the Bt11 x MIR162 x MIR604 corn acres. The corn rootworm refuge can be treated with a soil-applied or seed-applied insecticide to control corn rootworm larvae and other soil pests. The corn rootworm refuge can also be treated with a non-Bt foliar insecticide for control of late season pests, if pest pressure reaches an economic threshold for damage; however, if corn rootworm adults are present at the time of foliar applications, then the Bt11 x MIR162 x MIR604 corn field must be treated in a similar manner. Economic thresholds will be determined using methods recommended by local or regional professionals (e.g., Extension Service agents or crop consultants). Pests other than adult corn rootworms can be treated on the corn rootworm refuge acres without treating the Bt11 x MIR162 x MIR604 corn acres only if treatment occurs when adult corn rootworms are not present or if a pesticide without activity against adult corn rootworms is used. Pests on the Bt11 x MIR162 x MIR604 corn acres can be treated as needed without having to treat the corn rootworm refuge.

The following is a schematic of separate refuge deployment options:
