

U.S. ENVIRONMENTAL PROTECTION AGENCY

Office of Pesticide Programs Antimicrobials Division (7510P) 1200 Pennsylvania Avenue NW Washington, D.C. 20460

NOTICE OF PESTICIDE:

x Registration

Reregistration (under FIFRA, as amended)

EPA	Reg.	Number

Date of Issuance:

86131-1

DEC 1 2 2013

Term of Issuance:

Conditional

Name of Pesticide Product:

Enrich Products Ionization Systems

Name and Address of Registrant (include ZIP Code):

Enrich Products, Inc.

1018 Penn Avenue

Pittsburgh, PA 15221

Note: Changes in labeling differing in substance from that accepted in connection with this registration must be submitted to and accepted by the Antimicrobials Division prior to use of the label in commerce. In any correspondence on this product always refer to the above EPA registration

On the basis of information furnished by the registrant, the above named pesticide is hereby registered/reregistered under the Federal Insecticide, Fungicide and Rodenticide Act. Registration is in no way to be construed as an endorsement or recommendation of this product by the Agency. In order to protect health and the environment, the Administrator, on his motion, may at any time suspend or cancel the registration of a pesticide in accordance with the Act. The acceptance of any name in connection with the registration of a product under this Act is not to be construed as giving the registrant a right to exclusive use of the name or to its use if it has been covered by others.

The application referred to above, submitted under the Federal Insecticide, Fungicide and Rodenticide Act, as amended is acceptable under FIFRA sec. 3(c)(7)(A) provided that you:

- 1. Submit and/or cite all data required for registration/registration/registration review of your product when the Agency requires all registrants of similar products to submit such data.
 - a. The Silver DCI was issued on July 6, 2012 and the Copper DCI was issued on January 16, 2012, and you are responsible for addressing the data requirements outlined in both data call-ins. A copy of the DCIs can be located in the Dockets for these active ingredientshttp://www.regulations.gov/#!documentDetail;D=EPA-HQ-OPP-2009-0334-0032 and http://www.regulations.gov/#!docketDetail;D=EPA-HQ-OPP-2005-0558. If you have specific questions about the DCIs, contact Rose Kyprianou at 703-305-5354.
- 2. Submit a one-year study required to satisfy the storage stability and corrosion characteristics requirements (Guidelines 830.6317 and 830.6320). You have 18 months from the date of registration to provide these data.

A stamped copy of your labeling is enclosed for your records. Submit a final printed label before distributing or selling this product. The basic CSF dated 3/19/09 was found to be acceptable.

Enrich Products Ionization

Use Site Locations:

Building types include: Hospitals, Nursing Facilities, Retail Facilities and Amusement The Enrich Products Ionization System is Buildings, Commercial Buildings, Grocery a secondary treatment for potable water. Training / Workout facilities, Showering Stores, Dental Offices, Event Facilities, Manufacturing Plants, Government Facilities, Dormitories, Correctional Condominiums, Office Buildings, Homes, Hotels, Apartments,

Enrich Products Ionization, EPA Reg. No. 86131-R

[Claims:]

The Enrich Products Ionization (EPI) system is effective against legionella sp, ATCC33153, in both hot and cold potable water systems. The Enrich system achieves action as a strong biocide through cationic and surface-active emissions of positively charged copper and silver ions.

With more than 15 years of ionization experience, Enrich provides a proven solution. The Enrich system is capable of operating in multiple control modes, to best suit the application. The controller, software driven computer, constantly monitors all functional parameters to maintain the precise dose rate of copper and silver ions, providing protection and prevention of recontamination. The dose rate can be monitored locally and remotely over the internet. This protection and prevention of recontamination makes the Enrich system superior.

The Enrich controller receives multiple environmental data inputs and makes immediate compensatory adjustments. In the event of loss of power, all settings are stored in memory so that normal operation will resume once power returns. The Enrich system controls Legionella and requires minimal attention and maintenance.

Enrich equipment is capable of closed and open loop proportional ion level control. This results in precise control of copper and silver ions. Enrich equipment can be installed in circulating or non-circulating cold and hot water systems.

Enrich ionization technology provides a solution for controlling Legionella in cold and hot water systems. Legionella are killed rather than suppressed providing protection.

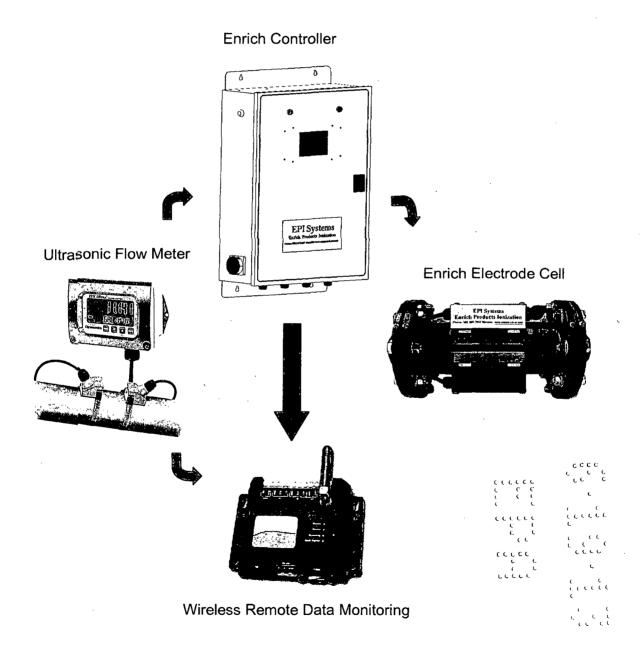

The levels of active silver and copper added to the water remain within the levels accepted by the Environmental Protection Agency

Limited Warranty and Disclaimer

The directions for use of this product are believed to be adequate and must be followed carefully, but it is impossible to eliminate all risks inherently associated with the use of this product. Ineffectiveness or other unintended consequences may result due to factors such as power or utility interruption, incorrect uses or application, or water stagnation or flow issues resulting from an error in the configuration of the plumbing system, all of which are beyond the configuration of the plumbing system.

Enrich Products' customers will develop a flushing protocol and document the operating of the system in accordance with the ionization equipment's specifications.

1. General Directions

It is a violation of federal law to use this product in a manner inconsistent with its labeling.

Before using this product, read the entire label and EPI Systems Enrich Products Ionization Installation and Operation Manual.

The Enrich Products Ionization (EPI) System uses a copper/silver ionization process to control Legionella in potable water distribution systems. Ionization creates a biocide as a result of charged copper and silver ions bonding with negatively charged sites on the bacteria cell walls. This electrostatic bond stresses the cell wall, which distorts cell wall permeability, thus reducing the normal intake of life-sustaining nutrients.

The **EPI System** maintains target levels of copper and silver below EPA maximum and secondary contaminant limits in drinking water.

2. Device Components

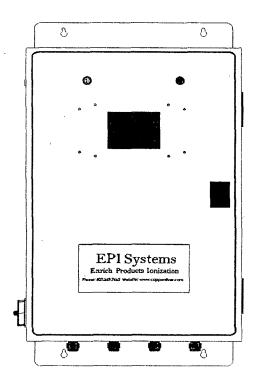

The Enrich Products Ionization system consists of three components: Controller, Electrode Cell, and Flow Meter.

The Controller is a wall-mounted software-based device that supplies an alternating DC voltage to the cell and is capable of operating in multiple output control modes, to improve control of the copper and silver ion output. The Controller applies a direct current across the alloy electrodes inside the Electrode Cell, stimulating the controlled release of ions. All Controller models incorporate a physical lock-out key and an HMI color touchscreen display for monitoring the system's status and making adjustments. All Controller models are capable of 0-100 VDC output, self-adjusting. All controller models contain a 4-20mA input for flow meter connections, an additional 4-20mA input, and 0-5 VDC output connections for Current and Voltage.

The rugged, epoxy coated aluminum Electrode Cell supplied with the Enrich control unit houses copper-silver alloy electrodes. The electrode cell is installed in the water pipe-work and is the source of the copper and silver ions. The metals used in the manufacture of the electrodes are of the highest assayed quality. Enrich supplies electrical quick connects from the Controller to the Electrode Cell in use. This provides easy connection and disconnection, when routine maintenance is required.

The flow meter detects the amount of water consumed when installed in hot or cold water applications. The output current of the Controller is automatically adjusted in direct proportion to the amount of flow registered by the flow meter. This reduces the likelihood of over or under ionization and lessens the frequency of maintenance needed on the Electrode Cell.

3. Enrich Equipment Specs 3.1. Enrich Controller

Dimensions: Width: 18.4" x Height: 32" x Depth 7", 54 Lbs.

Electrical Data: 120-240 VAC, 50/60 Hz, single-phase. DC output voltage is 0-100 volts for all models.

Control Unit Model	Max Current Draw	DC Output
CU-EPI-1	1.5 amps	1 amp
CU-EPI-2	3 amps	2 amps
CU-EPI-3	4 amps	3 amps
CU-EPI-4	5 amps	4 amps
CU-EPI-5	6.25 amps	5 amps
CU-EPI-6	7.5 amps	6 amps
CU-EPI-7	8.5 amps	7 amps
CU-EPI-8	10 amps	8 amps
CU-EPI-9	11 amps	9 amps
CU-EPI-10	12.5 amps	10 amps

3.2. Electrode Cell Specs

The Electrode Cell body is machined from a solid core of Aluminum, 6061 T-6 with no welds. The cell body can withstand pressures greater than 200 psi @ 200 F.

It is then coated with Corvel ECA 1626 blue fusion bond epoxy to a minimum thickness of 15 mils. This coating conforms to NSF61 and FDA 175.300. At 150 F at 500 hours there is no loss of adhesion and no blisters. Dielectric strength is >1000 volts/mil.

Electrode Cell Model	Electrode Count	Weight & Dimensions
EC-EPI3"x2	2	14.25"x7.25"; 22 lbs
EC-EPI4"x4	4	16.2"x8.5"; 35 lbs
EC-EPI4"x8	8	28.75"x8.5"; 60 lbs

EC = Electrode Cell, EPI = Enrich Products Ionization, 3" or 4"= Internal Diameter, 2, 4 or 8 = Quantity of Electrodes

All Electrode Cells include:

2" SS 316 male NPT threads for pipe connections

Electrode cell is manufactured from a solid aluminum core with no welds

Electrode cell is powder coated with NSF 61 certified epoxy

All wetted non consumable parts conform to NSF 61

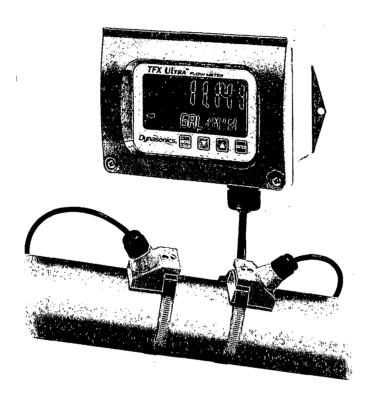

Electrical connections are housed within a machined black acetyl enclosure

Electrical quick connect is an insulated water tight connector

3.3. Flow Meter

The non (pipe) invasive ultrasonic flow meter is installed onto the cold water supply pipe-work to the water system. Detailed instructions for the installation of the Dynasonics® Ultrasonic Flow Meter are supplied with the meter.

The flow meter detects the amount of water consumed when installed in hot or cold water applications. The output current of the Controller is automatically adjusted in direct proportion to the amount of flow registered by the flow meter.

4. Monitoring

4.1. Site Copper Testing

After commissioning, site copper testing needs to be performed weekly, with at least two samples collected per system. One sample should be collected from the treated water supply, and the second should be from a location far away from the water supply (distal).

4.2. Lab Testing for Copper / Silver levels

Lab testing is the only way to accurately measure silver, reveals whether copper and silver levels are within optimal ranges, and determines whether system adjustments are needed.

4.3. Suggested Target Ranges for Ion levels

Copper: 0.28 – 0.80 mg/l Silver: 0.01 – 0.08 mg/l

The suggested ranges are recommended throughout the United States regardless of water conditions.

4.4. Site Copper Test Procedures

The following procedures apply to each site tested:

- Step 1: Turn the hot water on at the fixture / site.
- Step 2: Wait until the circulating hot water temperature is achieved and fill a 250 ml sample bottle to the top.
- Step 3: Collect samples in this manner until all samples are collected and take them to your shop.
- Step 4: Unscrew the covers from the glass bottles housed in the copper test kit carrying case.
- Step 5: Rinse the insides of two of the glass bottles.
- Step 6: Fill the two bottles to the 10 ml marked line with the water from one of the sample bottles and set them aside.
- Step 7: Remove one of the copper reagent foil packets.
- Step 8: Cut open the reagent packet along the dotted line.
- Step 9: Pour the entire contents of the reagent packet into only one of the glass bottles.
- Step 10: Screw on the covers to the glass bottles.
- Step 11: Shake the glass bottle that the reagent was poured into for approximately 10 seconds and set aside (make sure not to mix up the two glass bottles).
- Step 12: Remove water from the exterior of the bottle that does not contain the reagent using a non-abrasive cloth.
- Step 13: Remove the Hach® digital colorimeter.
- Step 14: Remove the cover of the colorimeter.
- Step 15: Place the glass bottle that does not contain the reagent sample holder within the test kit.
- Step 16: Rotate the bottle so that the diamond faces towards you.

- Step 17: Place the removable cover over the glass bottle. Note: when aligned correctly the cover will be perpendicular to the test kit and completely cover the glass bottle.
- Step 18: Turn the power on to the digital test kit.
- Step 19: Place the test kit on a level surface.
- Step 20: Press the "O" (zero) and wait for the display to read zero.
- Step 21: Remove the glass bottle from the test kit and set it aside.
- Step 22: Pick up the glass bottle that the reagent packet was poured into hold it up to a light source to verify that the reagent powder dissolved into the water or two minutes has passed.
- Step 23: Remove water from the exterior of the bottle using a non-abrasive cloth.
- Step 24: Place the second glass bottle into the test kit.
- Step 25: Rotate the bottle so that the diamond faces towards you.
- Step 26: Place the removable cover over the glass bottle. Note: when aligned correctly the cover will be perpendicular to the test kit and completely cover the glass bottle.
- Step 27: Press the "check" button.
- Step 28: Record the location and result on the site copper test log record.

Continue steps 5 - 28 until all of the site tests are completed. When complete press the power button to turn off the test kit.

4.5. Laboratory Testing (Copper / Silver ion level measurement)

Laboratory testing to measure the copper and silver ion levels is a significant piece of the water monitoring process. This data provides crucial information to all responsible parties. Since the suggested range for silver ions are extremely low, sophisticated equipment is required and on site monitoring is not always feasible. Both copper and silver ion levels must be measured at a laboratory regularly – monthly. For the first month, samples will be collected for laboratory analysis twice.

4.6. Sample Collection for Laboratory Analysis

Dates when samples will be collected for laboratory analysis will be coordinated and shall be performed monthly.

- Step 1: Turn on the hot water to the fixture / site.
- Step 2: Let the hot water run until circulating temperature is

achieved.

- Step 3: Fill the 250 ml bottle with at least 225 ml of hot water.
- Step 4: Mark the date and location on the bottle.
- Step 5: Use one plastic bottle per site, repeating steps 1 4.
- Step 6: Use the water in each of the collected plastic bottles to
 - perform your site testing. Note: Rinse the glass site

test bottles between each test in a sink.

Step 7: Record the locations, date and results on the site test

log record.

Once the site testing is completed, ship the water remaining in the plastic bottles to the approved lab for copper and silver ion level measurement.
