

Fact Sheet

1. Facility Name and Address: Washington Navy Yard
1014 N. Street, SE Suite 320
Washington, DC 20374

2. NPDES No. DC0000141

3. Receiving Stream: Lower Anacostia River

4. Receiving Stream Classification:

According to the District of Columbia Water Quality Standards §1101.2, the Anacostia River is designated for the following beneficial water uses:

- Class A - Primary Contact Recreation
- Class B - Secondary Contact Recreation and Aesthetic Enjoyment
- Class C - Protection and propagation fish, shellfish and wildlife
- Class D - Protection of human health related to consumption of fish and shellfish
- Class E - Navigation

The current water beneficial uses for this stream are:

- Class B - Secondary Contact Recreation and Aesthetic Enjoyment
- Class C - Protection and propagation fish, shellfish and wildlife
- Class D - Protection of human health related to consumption of fish and shellfish
- Class E - Navigation

5. SIC Code: 8744 - Facility Support Management Services

6. Description

The Naval District Washington, formerly the Washington Navy Yard (WNY), was established on October 2, 1799, and served as a major shipbuilding facility during the first part of the 19th century. During the latter part of the 19th century, shipbuilding operations ceased and the WNY became the Naval Gun Factory in 1886. During World War II the Naval Gun Factory employed 25,000 people and was the largest gun factory in the world. In 1961 gun production ceased and the facility was converted to administrative and supply use. During the public comment period the WNY brought to our attention that the area that this facility occupies is 80.2 acres on the banks of the Lower Anacostia River and borders the eastern boundary of the Southeast Federal Center.

Storm water that accumulates at the site is collected in a subsurface storm water drainage system which discharges directly into the Lower Anacostia River, the District of Columbia Combined Sewer System and to the District Separate Storm Sewer System (MS4). The WNY has use

permeable pavers at various sites of its facility. This facility has rehabilitated and cleaned its entire storm sewer system. As of 2005, 21,040 linear feet of storm sewer system were cleaned, 9,100 linear feet has been lined using cure-in-place liner, and 11,400 linear feet was replaced or newly installed.

In April 2007, the Naval District Washington submitted a revised Storm Water Pollution Prevention Plan (SWPPP) to EPA Region III as part of NPDES permit requirement. The revised SWPPP updated the 2000 SWPPP. This SWPPP makes special emphasis on the use of low impact development (LID) technology and keeps the core SWPPP best management practices, i.e., good housekeeping, preventive maintenance, spill prevention, inspections, employee training, eliminating storm water discharges, record keeping, sediment and erosion control and management of runoff. Some of the LID recommended technologies are: vegetated swales, permeable pavers, reuse of collected storm water, infiltration devices, etc.

7. Discharge Location:

9. NPDES Effluent Limits Rationale

Background Concentration values based on the Velinsky Report:

Parameter	Background Concentration
Arsenic+3	0.04 ug/l
Arsenic +3+4	0.34 ug/l

Cadmium	0.01 ug/l
Chromium +3	0.35 ug/l
Chromium +6	0.10 ug/l
Copper	1.34 ug/l
Nickel	1.75 ug/l
Lead	0.58 ug/l
Zinc	3.21 ug/l

Mixing Zone - Dilution Factors

Outfall No.	Dilution Factor
001	22.1
005	11.8
006	12.5
007	8.8
008	8.4
009	6.7
013	9.6
014	27.0

Acute Water Quality Criteria based on 110 mg/l hardness value.

Parameter	Acute Criterion
Dissolved Antimony	640 ug/l (30 day criteria)
Dissolved Arsenic	340 ug/l
Beryllium	No Criterion
Dissolved Cadmium	2.21 ug/l
Dissolved Hexavalent Chromium	16 ug/l
Dissolved Trivalent Chromium	616 ug/l

Total Chromium	100 ug/l (EPA MCL)
Dissolved Copper	14.7 ug/l
Dissolved Lead	71.63 ug/l
Total Recoverable Mercury	1.4 ug/l
Dissolved Nickel	508 ug/l
Dissolved Silver	110 ug/l
Dissolved Zinc	127 ug/l
Oil and Grease	10 mg/l
PCBs	0.000064 ug/l - Human Health
E. Coli	410 MPN/100ml
Chlordane	2.4 ug/l
DDE	1.1 ug/l
DDD	1.1 ug/l
DDT	1.1 ug/l
Dieldrin	2.5 ug/l
Heptachlor Epoxide	0.52 ug/l
PAH1 (naphthalene, 2-methyl naphthalene, acenaphylene, acenaphthene, fluorine, phenanthrene)	50 ug/l (chronic)
PAH2 (fluoranthene, pyrene, benz(a)anthracene, chrysene)	400 ug/l (chronic)
PAH3 (benzo(k)fluoranthene, benzo(a)pyrene, perylene, indeno (1,2,3-c,d)perylene, dibenzo(a,h+ac)anthracene)	0.031 ug/l (human health)

Reasonable Potential Analysis

Chapter 3 of the Technical Support Document for Water Quality-based Toxics Controls (TSD) explains the procedure used to determine if an effluent discharge has reasonable potential to exceed instream water quality criteria. For those parameters that reasonable potential values exceed the District of Columbia water quality criteria,

then water quality-based effluent limits must be calculated as required in 40 CFR 122.44(d). Since storm water discharges are intermittent, we are using the acute water quality criteria for the parameters of concern in order to assess the effluent for reasonable potential. We are using the acute criteria because a shorter exposure time representative of the storm water discharges.

According to the TSD, these are the steps for the determining excursions above the ambient water quality criteria; see Box 3-2 of the TSD.

- Determine the total of number of effluent data for a particular parameter (n) and identify highest value of the dataset for that parameter.
- Determine the coefficient of variation (CV) of the data set. The CV is equal to the standard deviation divided by the long term average.
- Determine the confidence level that you want to use for the reasonable potential multiplier. For this permit analysis, we are going to use the 95th confidence level.
- Calculate the percentile representing by the highest effluent concentration of the dataset for the parameter of concern. $P_n = (1 - .95)^{1/n}$
- Determine the reasonable potential multiplier

$$C_{95th}/C_{pn} = e^{(1.645 \cdot \sigma - 0.5 \sigma^2) / e^{(z \cdot \sigma - 0.5 \sigma^2)}}$$

$$\sigma^2 = \ln(CV^2 + 1)$$

$$\sigma = \text{square root of } \sigma^2$$

Example:

Arsenic Outfall 001

Total samples = 37

Highest effluent concentration = 470 ug/l

CV = 5.54

Confidence Interval = 95th

$$P_n = (1 - 0.95)^{1/n}$$

$$= 0.05^{1/37} = 0.9222$$

Z score = 1.420

$$\sigma^2 = \ln(5.54^2 + 1) = 3.456$$

$$\sigma = 1.859$$

$$RPMF = C_{95th}/C_{92.2th} = e^{(1.645 \cdot 1.859 - 0.5 \cdot 3.456)} / e^{(1.420 \cdot 1.859 - 0.5 \cdot 3.456)}$$

$$RPMF = 1.52$$

$$\text{Adjusted effluent concentration (AEC)} = 470 \text{ ug/l} \cdot 1.52 = 714 \text{ ug/l}$$

- Maximum Receiving Waste Concentration (MRWC)

$$\text{MRWC} = (\text{AEC} - \text{Cb}) / \text{DF} + \text{Cb}$$

Cb – Background concentration

DF – Dilution Factor

$$\text{MRWC} = (714 \text{ ug/l} - 0.34 \text{ ug/l}) / 22.1 + 0.34 \text{ ug/l} = 32.65 \text{ ug/l}$$

Acute criterion = 340 ug/l

Since the MRRWC is less than the instream acute water quality criterion for arsenic, we can conclude that there is not reasonable potential.

The reasonable potential analyses for outfalls 001E and 014F will be based on the mixing zone for outfall 009, since these outfalls are close to outfall 009. We decided to use the average dilution of outfalls 013 and 005 for the reasonable potential analyses at outfalls 015G and 015 H.

Water quality-effluent limits calculations

For those parameters that we found reasonable potential, the next step is to calculate the water quality-based effluent limits (WQBELs) using the procedure specified in the TSD, see Section 5.4 of the TSD.

- The first step on the calculation of the WQBEL is to compute the wasteload allocation.

$$WLA = (WQC - C_b) * DF + C_b$$

WLA – Wasteload allocation

WQC – Water quality criterion for the pollutant of concern

C_b – background concentration for the pollutant of concern

DF – Dilution Factor

Here is an example:

Outfall 001

Parameter: Lead

Water quality Criterion (WQC) – 71.6 ug/l

Background Concentration – 0.58 ug/l

Coefficient of Variation – 4.27

Dilution Factor – 22.1

$$WLA = (71.6 \text{ ug/l} - 0.58 \text{ ug/l}) * 22.1 + 0.58 \text{ ug/l} = 1570 \text{ ug/l}$$

- Calculate the long term average value

$$LTA = WLA * e^{(0.5 \text{ sigma square} - 2.326 \text{ sigma})}$$

The long term average calculation is based on the 99th confidence level as reflected with the z score value of 2.326.

$$\begin{aligned} \text{Sigma square} &= \ln(CV^2 + 1) \\ &= \ln(4.27^2 + 1) = 2.957 \end{aligned}$$

$$\text{Sigma} = \text{square root of Sigma square} = 1.719$$

$$LTA = 1570 \text{ ug/l} * e^{(0.5 * 2.957 - 2.326 * 1.719)} = 126 \text{ ug/l}$$

$$\text{Maximum Daily Limits (MDL)} = LTA * e^{(2.326 * \text{sigma} - 0.5 * \text{sigma square})}$$

The maximum daily limits is based on the

$$\text{MDL} = 126 \text{ ug/l} * e^{(2.326 * 1.719 - 0.5 * 2.957)} = 1570 \text{ ug/l}$$

Since the stormwater discharges are intermittent events, the permit writer considers that the monthly average limits for this type of discharge are not appropriate.

Water Quality-based Effluent Limits Summary

Outfall	Parameter	WLA (ug/l)	Maximum Daily Limit (ug/l)
001	Lead	1570.1	1570
001	Zinc	2739	2739
005	Copper	159	159
005	Lead	838.6	839
005	Zinc	1463.9	1464
006	Copper	168.3	168
006	Zinc	1550.6	1551
007	Copper	118.9	119
008	Copper	113.6	114
008	Zinc	1043	1043
Outfall	Parameter	WLA (ug/l)	Maximum Daily Limit (ug/l)
009	Copper	90.9	91
013	Copper	129.6	130
013	Lead	682.4	682
013	Zinc	1191.6	1192
014	Copper	362.1	362
014F	Copper	90.9	91
001E	Copper	90.9	91
015G	Copper	144.3	144
015H	Copper	144.3	144

10. Section 303(d) and TMDLs

The District of Columbia has developed several Total Maximum Daily Loads (TMDLs) to address water quality impairments to the Anacostia River.

Lower Anacostia River TMDL	TMDL Developed	EPA Approved	WLA
Fecal Coliform Bacteria	June 2003	August 28, 2003	97% Reduction from Direct Storm water discharges
Oil and Grease TMDL for the Anacostia River	October 2003	October 31, 2003	Stream is presently not impaired for oil and grease.
Organics and Metals	August 2003	October 23, 2003	Arsenic – 85% reduction Copper – 1% Reduction Lead – 1% Reduction Zinc – 1% Reduction DDD – 90% Reduction

			DDE – 90% Reduction DDT – 90% Reduction Dieldrin - 30% Reduction Chlordane – 90% Reduction Heptachlor Epoxide – 80% Reduction PAH1 – 98% Reduction PAH2 – 98% Reduction PAH3 – 98% Reduction
Total Suspended Solids	June 2007	June 15, 2008	TSS – 85% Reduction Total Nitrogen – 50% Reduction Total Phosphorus – 50% Reduction
BOD, total nitrogen, and Total Phosphorus	May 2001	February 27, 2008	BOD – 50% Reduction Total Nitrogen – 30% Reduction Total Phosphorus – 30% reduction

Based on the approved TMDLs listed above the following baseline loadings have been established for the WNY using the 80.2 acres. The WLA values presented in this table are equal to the percent reduction levels established in the TMDLs times the baseline loads. See Attachment I for the basis of the baseline loadings calculations, Memo from Ross Mandel to Francisco Cruz.

Parameter	TMDL	WNY Baseline loading (lbs/year)	WLA (lb/year)
Arsenic	Organics and Metals (2003)	0.498	0.0747
Copper	Organics and Metals (2003)	19.8	19.602
Lead	Organics and Metals (2003)	99.8	98.802
Zinc	Organics and Metals (2003)	59.9	59.301
Chlordane	Organics and Metals (2003)	0.00345	0.000345
DDD	Organics and Metals (2003)	0.00145	0.000145
DDE	Organics and Metals (2003)	0.00491	0.000491

DDT	Organics and Metals (2003)	0.0129	0.00129
Dieldrin	Organics and Metals (2003)	0.000158	0.0000158
PAH	Organics and Metals (2003)	2.6	0.052
PAH1	Organics and Metals (2003)	0.233	0.00466
PAH2	Organics and Metals (2003)	1.44	0.0288
PAH3	Organics and Metals (2003)	9.28	0.1856
Heptachlor Epoxide	Organics and Metals (2003)	0.000387	0.0000774
PCB	PCB (2007)	0.0793	
Total Suspended Solids	Total Suspended Solids (2007)	42,800	6420
BOD	BOD/TN/TP (2008)	16000	8000
TN	BOD/TN/TP (2008)	1390	695
TP	BOD/TN/TP (2008)	181	90.5

Based on our reasonable potential analysis, the WNY does not have reasonable potential to exceed the arsenic criteria in any of its outfalls, therefore this permit will not require water quality-based effluent limits for this parameter. The permit will require compliance with total copper, lead, and zinc water quality-based effluent limits to ensure compliance with the TMDL. The permit will not require limits for DDD, DDE, DDT, Dieldrin, Aldrin, Heptachlor Epoxide, since all the effluent data for these parameters are below detection level.

Since the District of Columbia has adopted e. coli water quality criterion, this permit will require monitoring for this parameter.

The oil and grease TMDL does not require any reduction for this parameter.

The WNY has shown reasonable potential to exceed the copper water quality criteria at outfalls 005, 006, 007, 008, 009, 013, 001E, 014, 014F, 015G and 015H. The permit contains water quality-based effluent limits for copper at these outfalls consistent with the TMDL.

EPA has developed water quality-based effluent limits for total lead at outfall 001 and 005, consistent with the TMDL requirements and our reasonable potential analysis.

EPA has developed water quality-based effluent limits for total zinc at outfalls 001, 005, 006, 008 and 013 consistent with the TMDL and our reasonable potential analysis.

The previous permit required no discharge of PCBs. Therefore, this permit will maintain this limit to comply with the TMDL wasteload allocation and the antibacksliding requirements. For the purpose of this permit, samples will be analyzed using both method 608 and 1668B, for compliance purposes only those results determined using method 608 will be used. The PCBs special condition in Part III.A.19.b, has been revised to specify that in the event that the analytical results of the samples using method 1618B are below the detection limit of the test, monitoring may be discontinued after two years of monitoring data. Furthermore, if the results of this testing are at or above the detection limit of method 1668B, the monitoring shall continue during the life of the permit and the permittee shall submit a pollutant minimization plan to address the PCBs contamination.

The effluent limits for total suspended solids, BOD5, total nitrogen, total phosphorus, PAH, PAH1, PAH2, and PAH3 are expressed as aggregated loads based on the percent reduction levels specified on the approved TMDLs and the WNY baseline loadings indicated on the above table.

Since the TSS TMDL specifies a total nitrogen and total phosphorus reductions of 50% from the existing loads. These WLAs are more stringent than the one specified in the BOD TMDL. Therefore, the total nitrogen and total phosphorus limits will be based on the TSS TMDL, which are is more stringent than the 30% reduction specified in the BOD TMDL

As shown in the effluent characterization tables above, the Washington Navy Yard discharges high levels of fecal coliform at outfalls 001, 005, 006, 007, 008, 013, 015G and 015H. The District of Columbia 2006 Water Quality Standards discontinued the fecal coliform criteria on December 31, 2007. The District of Columbia replaced the fecal coliform water quality criteria with the E. Coli criteria. Monitoring only will be required in this permit to assess if the facility has the reasonable potential to exceed the E. Coli criteria. After one year of monitoring requirement for E. Coli bacteria, EPA will evaluate the data and make a determination if this permit should be modified to require a water quality-based effluent limit for this parameter. Also, the permit will require the permittee to assess the sources of fecal coliform to determine if the sources of this parameter are to human, wildlife sources or other sources. If the fecal coliform sources are anthropogenic, the permittee shall submit a correction plan to address them.

Within twelve months of the effective date of this permit, the permittee shall submit a report identifying which Best Management Practices that the WNY is implementing and what is the percent reduction achieved by them with respect of the baseline loads identified on the above table.

10. Proposed Effluent Limits

Outfall 001

- (1) The TSS TMDL limits are based on the TMDL and expressed as aggregated loads equal to 6420 lb/year. How to calculate the aggregated TSS load? $\text{Flow (mgd)} \times \text{concentration (mg/l)} \times 8.34 \times \text{Storm events per quarter}$ for all the outfalls. The permittee shall report bimonthly the accumulative load, so at the end of the year the permittee shall not exceed the total annual load of 6420 lb/year.
- (2) The BOD₅ limits are based on the TMDL are expressed as aggregated loads equal to 8000 lb/year. How to calculate the aggregated BOD₅ load? $\text{Flow (mgd)} \times \text{concentration (mg/l)} \times 8.34 \times \text{Storm events per quarter}$ for all the outfalls. Bimonthly the permittee shall report the accumulative load, so at the end of the year the permittee shall not exceed the total annual load of 8000 lb/year.
- (3) The total nitrogen limits are based on the TMDL are expressed as aggregated loads equal to 695 lb/year. How to calculate the aggregated TN load? $\text{Flow (mgd)} \times$

concentration (mg/l) x 8.34 x Storm events per quarter for all the outfalls.

Bimonthly the permittee shall report the accumulative load, so at the end of the year the permittee shall not exceed the total annual load of 695 lb/year.

- (4) The total phosphorus limits are based on the TMDL are expressed as aggregated loads equal to 90.5 lb/year. How to calculate the aggregated total phosphorus load? Flow (mgd) x concentration (mg/l) x 8.34 x Storm events per quarter for all the outfalls. Bimonthly the permittee shall report the accumulative load, so at the end of the year the permittee shall not exceed the total annual load of 90.5 lb/year.
- (5) The permit will require no discharge of PCBs. For the purpose of this permit samples will be analyzed using both Methods 608 and 1668 B, for compliance purposes only those results determined using method 608 will be used.
- (6) The total PAHs limits are based on the TMDL are expressed as aggregated loads equal to 0.0466 lb/year. How to calculate the aggregated PAHs load? Flow (mgd) x concentration (mg/l) x 8.34 x Storm events per quarter for all the outfalls. Bimonthly the permittee shall report the accumulative load, so at the end of the year the permittee shall not exceed the total annual load of 0.0466 lb/year.

The PCBs limits are the same as previous permit consistent with the antibacksliding regulations, 40 CFR 122.44(l). The monitoring frequency for PCBs has been changed from bimonthly to semiannual.

The permit allows a three years compliance schedule for the WNY to identify storm water control measures to achieve the water quality-based effluent limits for total suspended solids, BOD5, total nitrogen, total phosphorus, total copper, total zinc, PAHs, and total lead, see Part III.B.1 of the permit. The permit includes monitoring only for these parameters as interim permit requirements, except for total copper at outfalls 006 and 008 and oil and grease at outfalls 009, 014, and 015H, that were imposed at the existing limits specified in the current permit, in order to comply with the antibacksliding regulations.

11. Antidegradation Requirements

The Lower Anacostia River is a Tier 1 protection water. The proposed permit contains water quality-based effluent limits for several pollutants as required by the approved District of Columbia TMDLs. In addition, the permittee has revised its SWPPP including LID technologies implementation. Based on this information, we conclude that the discharges from this facility will not downgrade the water quality of the Lower Anacostia River.
