Re: Waterbury Rolling Mills (WRM), Waterbury Connecticut

Dear Mr. Gilbert:

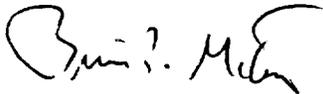

Enclosed is the updated and final RCRA Corrective Action Environmental Indicator Evaluation (EI) RCRIS Code (CA-725) for Human Exposures Under Control for the referenced site. This evaluation supercedes previous EI CA-725 evaluations submitted by GZA Environmental Inc., Haley & Aldrich and Malcolm Pirnie, Inc. (Pirnie). This document is submitted to provide a current assessment and account for the newest data collected on the site associated with a Phase III Site Assessment (Phase III). The new data collected pertaining to this report are included in the text and appendix sections provided.

Any conditions on the site that have changed since the earlier EI CA-725 evaluations have been included in the current assessment report.

If you have any questions, please contact me at (860) 635-3400.

Very truly yours,

MALCOLM PIRNIE, INC.

Brian P. McCarthy, LEP
Senior Project Hydrogeologist

Re: Waterbury Rolling Mills (WRM), Waterbury Connecticut

Dear Mr. Gilbert:

This is to confirm that all requirements have been met for completion of the RCRA Corrective Action Environmental Indicator Evaluation (EI) RCRIS Code (CA-725) for Human Exposures Under Control for the referenced site. Final revisions were provided to you by mail on September 7, 2005 and additional minor corrections were submitted by email on September 14.

As noted on page 3E of the Historic Landfill Area (SWMU #13) Release Summary and on page 4-5 of the Special Study Report, WRM installed 48" tall snow/drift fencing and posted warning signs to restrict access to the area in SWMU #13 where copper was found in soil at concentrations exceeding CTDEP IDEC. Two signs (24" by 30"), posted on the sides of most likely access to the area, say "**Danger. No Trespassing. Authorized Personnel Only**". Two additional signs (12" by 18") were posted on sides where access is unlikely, which say "**Danger. Keep Out**".

If you have any questions, please contact me at (860) 635-3400.

Very truly yours,

MALCOLM PIRNIE, INC.

Andrew J. Danzig, PE

1.0 Introduction

This report is a revision from the original Malcolm Pirnie Inc. (MPI) Environmental Indicator (EI) Report that was submitted to Region 1 USEPA (USEPA) in December 2001. It contains additional soil and groundwater data that were generated during a Phase III Environmental Site Assessment (Phase III ESA) and supplemental investigation performed throughout April of 2005. The supporting documents referenced in this report are listed in bibliographical form in Appendix A. A list of Solid Waste Management Units (SWMUs), Areas of Concern (AOCs) and National Corrective Action Prioritization System (NCAPS) are provided on Table 1 (Appendix B). Table 1 is presented to outline and address the questions of whether (1) releases had occurred at these areas and, (2) if human exposure pathways were or were not present. Table 1 also summarizes by area, the data relied upon, if any, generated since the original EI in 1999 by GZA.

This report supplements the earlier EI submittals for the site and closes the data gaps for SWMUs, AOCs and NCAPS for which determinations were not previously possible. Several areas identified on the NCAPS list were previously evaluated in the initial EI submittal and were not re-assessed unless additional characterization was warranted. The NCAPS areas were evaluated by MPI and a report was submitted to USEPA on November 5, 2001. The location specific information provided in this report is used in support of the EI forms for human health exposure stabilization (CA-725).

1.1 BACKGROUND

In September of 1999 Waterbury Rolling Mills (WRM) of Waterbury, Connecticut agreed to evaluate the RCRA Corrective Action Environmental Indicators (EIs) under the USEPA Voluntary Corrective Action (VCA) Program. These EIs provide a basis of evaluation of current site conditions used to determine if the facility currently meets or likely could meet criteria to be classified as "stabilized" for human exposures and ground water indicators, CA-725 and CA-750, respectively.

GZA GeoEnvironmental Inc. submitted the initial EI site evaluation document and the EI checklist to USEPA in December 1999 and March 2000, respectively. These documents consisted of a summary of various SWMUs and AOCs along with the associated EI form. The environmental conditions were evaluated and it was concluded that data was insufficient to make a determination. The majority of the SWMUs and AOCs were controlled for human exposures while others needed characterization. This submission presents all relevant data obtained since those initial submissions through June 2005, and provides determinations for all areas with respect to CA-725.

2.0 Site Description

2.1 GENERAL

The WRM site is located in Waterbury, Connecticut, approximately one-quarter mile north of the confluence of Steele Brook with the Naugatuck River and about one mile north of the Interstate 84 and Route 8 interchange, as shown on Figure 1 (Appendix C). Current site land use is industrial, and land use in the immediate area is a mix of industrial and commercial.

The site consists of approximately 12 acres of land as shown on Figure 2 (Appendix C). Site improvements include a manufacturing building: 125,000 ft²; a small (2,000 ft²) grinding shop building at the north side, two small (1,800 ft² and 4,100 ft²) office/storage buildings on the south side fronting the street, and a training trailer (600 ft²) and paved yard areas. The manufacturing buildings are of various ages, all with concrete floors at grade. Roofing is mainly rolled-roofing with some shingles and rubber. Building walls are composed of brick masonry except for a recent addition, across the east end of the brick masonry mill buildings, which is an engineered metal building. The majority of the site area south of the grinding shop is paved with asphalt and concrete. North of the grinding shop are two former wastewater treatment impoundments (now capped), and undeveloped land. Additional undeveloped land is also owned by WRM on the opposite side of Steele Brook.

On the north side of the manufacturing building are several other ancillary structures and storage areas the largest being a 700 ft² brick building now used for storage. West of this building is an air pollution control structure (baghouse) that collects dust from the manufacturing process, prior to transport offsite for recycling. In the northwest corner of the yard area are two covered concrete staging pads for rolloffs and a liquid hydrogen and liquid nitrogen storage area.

2.2 VICINITY DESCRIPTION

The site lies in an industrial area of Waterbury and is surrounded by numerous, closely spaced industrial facilities. To the immediate west, north, east, and south are Steele Brook, a former railroad grade (purchased by WRM in 1998), and East Aurora Street, respectively. Opposite Steele Brook are vacant land (owned by WRM) and the Anchor Fasteners facility. Opposite the railroad grade on the east is (from north to south) Mirror Polishing & Plating and Fibercote (a.k.a. U.S. Prolam). Opposite the WRM site on East Aurora Street is the former property that is now called AREV East Aurora Street, LLC, and east of that property is the Albert Brothers scrap metal recycling facility. The adjacent businesses are shown in their approximate locations on Figure 2.

2.3 PHYSICAL SETTING

The site is located in a flat to gently sloping triangular river terrace north of the confluence of Steele Brook and the Naugatuck River, (see Figure 1). These two watercourses flow generally southward in the site area and form the southeastern and southwestern sides of the terrace, which are about three-quarters of a mile wide at its north end. The terrace elevation is approximately 280 to 300 feet above mean sea level. The north side of the terrace and the opposite sides of the brook and river are bounded by hills rising to over 550 feet above mean sea level. Elevations on-site range from about 275 to 280 feet. The two watercourses in the vicinity are the presumed discharge locations for groundwater in the area. Steele Brook, the lesser stream, transects the site at elevations of approximately 270 feet and the Naugatuck River, the greater watercourse to the east, lies at approximately 260-265 feet.

The terrace is underlain primarily by sand and gravel. Beneath the extreme northern part of the site, there is a 5-foot-thick layer of dark brown sand and ash fill near the river. At most locations beneath the fill is roughly 20 feet of coarse-grained sand and gravel.

However, deep wells onsite penetrate about 75 feet of silty, fine-grained sand before reaching glacial till and metamorphic bedrock. All soil boring and well locations are shown on Figure 2 and Figure 2A (most recently installed borings and wells).

Groundwater is present in the overburden at depths of about 12 to 15 feet at the eastern site boundary and at 7 to 8 feet near Steele Brook. The brook lies in a channel that is about eight feet deep. A groundwater table flow direction and contour map for the site is provided in Figure 3 in Appendix C. More recent groundwater elevation data collected in 2005 is consistent with groundwater flow depicted in this 2002 map.

2.4 DESCRIPTION OF OPERATIONS

WRM manufactures rolled copper products for the electronic and other industries. The process includes the electric induction casting of copper based alloys into continuous horizontally casted copper based strips that are then rolled into thinner strips, annealed and chemically cleaned.

The production activities at WRM include:

- Casting
- Milling
- Annealing
- Rolling
- Chemical cleaning with alkali and acid
- Slitting

Melting furnaces convert recycled copper alloy scrap and virgin materials into a molten metal. The molten metal is extracted through graphite water-cooled dies (casted), then coiled. The coils are then milled to remove surface imperfections. Water-soluble oils are used in this process as lubricants. After milling, the coils are rolled. Water-soluble and mineral oils are used in this process.

The coils are then placed in natural gas fired, inert atmosphere annealing furnaces for stress relief. Recirculated non-contact cooling water is used to control the temperature of the annealing process.

A continuous chemical cleaning line is used to remove smut, carbon and metal oxides from the surface of the metal. This line includes an alkaline cleaner, an acid pickle bath, associated rinse tanks and the application of an oxidation inhibiting coating.

Maintenance activities include general machining (milling, grinding), parts washing (using a non-hazardous cleaner), and painting (using latex based paints applied with a brush or roller).

2.5 FACILITY UPGRADES

2.5.1 AOC # 8 AST in Office building

Since the initial EI submission in December 1999, the 330 gallon above ground storage tank (AST) (AOC #8) that provides heating fuel oil for the office building was upgraded. The new tank is located in the same location as the former in the northwest end of the basement of the office building. The new tank is 275 gallons and is a double walled tank with a leak detection float in the interstitial space between the tank walls. The new tank was installed during the first week of October 2001. The exterior fill pipe and vent are provided with a bermed splash pad for overflow protection.

2.5.2 AOC # 12 (transformers)

Also since the initial EI submission, AOC #12 has been upgraded. Three transformers have been taken out of commission at this location and have been replaced with two transformers. Both of the replacement transformers are brand new. One is a dry transformer and the other is a non-polychlorinated biphenyl (PCB) oil unit.

WRM is implementing a groundwater monitoring program to assess the presence and, if so, concentration of volatile organic compounds (VOC) associated with these areas. In general, this will be accomplished by sampling groundwater on the presumed downgradient side of the transformers including the four located in the main building and three in exterior areas.

3.0 SWMUs, AOCs and NCAPS Evaluations

3.1 CONTROLLED AREAS

The following list of SWMUs and AOCs were identified in the initial GZA December 1999 report and CA-725 EI. The locations of these on-site are shown on Figure 2. These areas and/or processes were determined in the GZA December 1999 report as being controlled for human exposures. MPI has reviewed these earlier findings and has provided reasons and rationale for concurrences per each of these items on the applicable corresponding EI form. Areas in bold print required additional evaluation that is presented in this report. The numbering corresponds to that used in the original EI evaluation.

SWMUs

1. Former Outside Drum Storage Area
2. Baghouse Storage Area
3. **PCB Storage Shed**
4. Griset Mill Satellite Storage
5. Wastewater treatment system/discharge
6. Primary waste storage area
7. Secondary Waste Storage Area
8. Former Surface impoundment area
9. Exhaust Condensate collection system from annealing furnaces
10. Metal hydroxide sludge roll off
11. Scrap concrete/firebrick and metal roll off
12. Oily sweeps roll off
13. **Historic Landfill Area**
14. Former Hazardous Waste Storage Area
15. Former Waste Oil AST

AOCs

1. Former sulfuric acid storage
2. Sulfuric acid spill area
3. Former tanks by accounting office building
4. Former tanks near maintenance area
5. Parts washer
6. Virgin oil storage (grinding shop)
7. Virgin oil storage (production bldg)
8. Above ground storage tank (AST) in office building
9. Diesel AST for 400kw emergency generator outside baghouse area
10. No. 2 fuel oil AST for boiler
11. Four former tanks near railroad tracks
12. Transformers
13. A. Fuel oil underground storage tank (F8, not found)
B. Former 4,000 gallon Diesel/Gasoline UST

Note: AOC 13 has been revised from the December 1999 report to include 13a and 13b. Also according to WRM personnel, UST E7 was interchanged with UST F8.

Areas identified in the NCAPS review were also determined to be controlled for human exposures in a November 5, 2001 report to USEPA by MPI on behalf of WRM. These areas are also shown on Figure 2. There is some overlap between SWMUs, AOCs and NCAPS areas.

NCAPS Areas

1. Metal Hydroxide Sludge Lagoon
2. Hazardous Waste Storage Shed
3. Former Waste Oil Storage Tank (7,500 gallon)
4. Pickling Line
5. Waste Water Treatment System
6. Baghouse Storage Area

7. Furnaces
8. Waste Storage AST (550 gallon)
9. Rolling Mills
10. Slitting Rooms
11. Furnace Oil Spill Area (Stain)
12. Machine Shop
13. Drum Storage Areas
14. PCB Storage Area

Areas that were further investigated and then determined to be controlled for Human exposures were:

- PCB Storage Shed (SWMU #3)
- Historic Landfill Area (SWMU #13)

Potential human exposures that are addressed in this report include:

- Site wide volatilization for groundwater constituents, ~~and~~

All environmental data have been compared to applicable criteria under the Connecticut Department of Environmental Protection (CTDEP) Remediation Standard Regulations (RSR). Data has also been compared to the March 2003 Proposed Revisions of the groundwater volatilization criteria.

4.0 Evaluations of Human Exposures from SWMU #3, and SWMU #13

4.1 SWMU #3

4.1.1 Sampling and Analysis Plan

The PCB storage shed (SWMU #3) was initially evaluated to be controlled for human exposures in the December 1999 EIE. The storage shed was decommissioned and the concrete floor was decontaminated in January of 2000. The wastewater generated by the floor decontamination was analyzed for PCBs and residual concentrations were detected. Due to this, a work scope was prepared by Haley and Aldrich (H&A) (March 2001) proposing sampling for PCBs in soil surrounding the storage unit. On May 2nd and 3rd 2001 soil samples were collected from beneath the concrete floor in the center of the storage unit (1 boring), on the east side (2 borings), and on the south side (1 boring). The samples were collected from the surface to a depth of 5 feet below grade. The samples of the surface materials surrounding the floor and the associated underlying soil were collected in 6-inch increments. Initially the upper level pavement and soil were analyzed, progressing downward in an incremental fashion until the PCB concentrations were reported to be less than 1 part per million, the Residential Direct Exposure Criteria (RDEC). These borings and samples were identified as HA-8, HA-5, HA-6 and HA-7, respectively and are located on Figure 4 in Appendix C. The soil samples were analyzed for PCB using EPA Method 8082. Sample HA-8 was also analyzed for PCBs by the synthetic precipitation leaching procedure (SPLP).

MPI collected concrete drill dust samples in accordance with EPA guidelines in November of 2001 to further verify the concentration of PCB residuals on the surface of the concrete floor.

Soil was subsequently sampled by MPI from surface soil following the removal of the original concrete floor. Soil was collected from 4 spots in this area and was composited for analysis. The sample was collected on November 21, 2001 and was analyzed for PCB by EPA Method 8082, Extractable Total Petroleum Hydrocarbons (ETPH), and Total Resource Conservation Recovery Act (RCRA) Metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium and silver) plus total copper.

4.1.2 Results

Concentrations of PCBs in the uppermost level pavement and soil samples collected by H&A were below the detection limits in samples HA-5, HA-6 and HA-7. Consequently, deeper samples at these locations were not analyzed in accordance with the sampling plan. The soil sample collected from HA-8 (within the PCB storage shed footprint) directly below the concrete pad had a PCB concentration of 0.093 mg/kg. All sample results were below the RDEC for PCB of 1 mg/kg.

Concrete drill dust samples P-1 through P-4 collected by MPI on November 21, 2001 had PCB concentrations of 0.668 mg/kg, 18.4 mg/kg, 23.4 mg/kg and 32.4 mg/kg, respectively. Three of these concentrations exceed the RDEC of 1 mg/kg. Concrete sample locations are also shown on Figure 4.

Following removal of the floor, MPI collected a composite soil sample from temporarily exposed soil at the pad area. The confirmatory soil sample was a composite sample collected from 4 places below the pad (also shown on Figure 4) and composited for analysis as one sample. The PCB result for this composite sample was 81 mg/kg. Copper was also detected in the sample at a concentration of 4,600 mg/kg that exceeds the RDEC of 2,500 mg/kg.

Based on the visible nature of fill material in the underlying soil, WRM replaced the PCB storage shed floor on November 26, 2001 with a new concrete floor. This floor renders the underlying soil inaccessible. PCB residues remaining in place do not represent a human exposure hazard under existing site conditions.

The laboratory data reports for all characterization samples of the concrete floor and soil underlying and surrounding the PCB storage shed are provided in Appendix D.

4.1.3 Interim Corrective Action for SWMU #3 and Confirmatory Results

As previously stated, WRM elected to remove and dispose of the original concrete floor associated with the former PCB storage shed due to the results of the concrete sampling. The concrete floor was broken up and removed on November 19, 2001. A new replacement floor was installed on November 26, 2001. The concrete was disposed offsite in accordance with all Federal, State and Local regulations. All underlying residual soils are rendered inaccessible and the unit is currently **controlled for human exposures**. Photographs of this work are provided in Appendix E.

4.2 SWMU # 13

4.2.1 Sample and Analysis Plan

Supplemental investigations for this area were performed in accordance with the work plan (March 2001) submitted by H&A. MPI also performed extensive shallow soil sampling in this area in accordance with an investigation in August 2001, the Phase III ESA performed in the Spring of 2002, and a supplemental Phase III investigation in April 2005.

Preliminary work was performed in this area by H&A on May 2nd and 3rd, 2001 and reported on June 28, 2001. SWMU #13 was subsequently characterized in accordance with the work scope proposed by MPI dated August 2001. The investigation by MPI was designed to characterize target constituent concentrations of the fill material in the historic landfill area for direct exposure. Under the MPI investigation a total of nine borings were drilled in this area from which one sample was collected from each boring and analyzed for total copper, SPLP copper, ETPH and VOCs by USEPA Method 8260B. This analytical plan was developed based on constituents detected in soil in previous investigations at the site. The soil sample interval selected for analysis was

generally 0 to 4 feet below grade, consistent with "accessible soil" as defined in the Connecticut RSR. Boring locations are shown on Figure 2 and 2A. Some delineative sampling in this area that took place in April 2005 included deeper soil sampling to usually six (6) feet below grade.

4.2.2 Results

The MPI report of supplemental investigations was sent to USEPA on September 17, 2001. The data at that time indicated that all total copper concentrations from these soils meet the Industrial/Commercial Direct Exposure Criteria (IDEC) and Class GB groundwater Pollutant Mobility Criteria (GBPMC). Six soil samples however exceeded the RDEC for total copper. Toluene, trichloroethene and naphthalene were detected in various samples, however all were below the respective RDEC, IDEC and GBPMC for those compounds. The results for detected constituents from this and previous sampling at SWMU #13 are summarized in Tables 2 and 2A in Appendix B. Laboratory data reports are provided in Appendix D and Appendix F.

Due to the heterogeneous characteristic of the fill material in this area, copper and TPH concentrations exceeding the RDEC of 2,500 mg/kg for both, but not the IDEC of 76,000 mg/kg for copper, are distributed sporadically throughout the area investigated. The highest concentrations are generally located in the southwestern most portion of SWMU # 13 between the former and present stream channels.

Copper was detected at concentrations exceeding the RDEC at borings B-22/MP-4, B-24, B-26/MP-5, B-28, B-29 and B-30. The copper concentrations did not exceed IDEC or GBPMC for any of the analyzed samples. Former borings B-01, B-02 and B-03 also exceeded the RDEC for copper in shallow soil. These copper concentrations ranged from 269 mg/Kg at boring B-23 to 62,100 mg/Kg at boring B-24 but were below the IDEC. Based on the total number of samples and the distribution of sampling locations throughout the area of interest, we are confident that the range of detected concentrations is representative of the area investigated.

ETPH was detected at concentrations exceeding RDEC (500 mg/Kg) at borings B-24 and B-30. No samples exceeded IDEC or GBPMC (2,500 mg/kg) for ETPH. The ETPH concentrations ranged between less than 10.0 mg/Kg at two of the borings (B-25 and B-29) to 930 mg/Kg at boring B-24.

VOC were detected in four of the nine samples collected although none exceeded their respective RDEC, IDEC or GBPMC. Toluene was detected at a concentration of 15 ug/Kg at boring B-24 compared to the lowest applicable criterion (GBPMC) of 67,000 ug/Kg. Trichloroethene was detected at boring B-24 at a concentration of 36 ug/Kg, at B-25 at a concentration of 43 ug/Kg, at B-27 at a concentration of 25 ug/Kg and at boring B-29 at a concentration of 29 ug/Kg. All detected concentrations are well below the lowest applicable criterion (GBPMC) of 1,000 ug/Kg. Naphthalene was detected in boring B-30 at a concentration of 39,000 ug/Kg compared to the lowest applicable criterion (GBPMC) of 56,000 ug/Kg.

The new data collected in April 2005 near former boring B-24 (0-2') (where a copper concentration of 62,100 mg/kg was previously detected in August 2001) determined copper to be present at a concentration of 193,000 mg/kg (B-37 0-2'), which exceeds the IDEC. This was the first concentration from this area that exceeded a direct exposure criterion. The SPLP concentration of 0.602 mg/l for this sample did not exceed the GBPMC for copper of 13 mg/l.

The area adjacent to B-37 will require remedial measures to address the copper concentration that exceeded the IDEC. This measure will likely involve excavation and disposal of soil from this limited area. The area where boring B-37 was performed is a fenced in area bounded by Steele Brook to the west and is not accessible to the public or pedestrians. The area is also far removed from any facility workers and/or areas of site processes. As an added precaution against possible exposure to anyone who may stray into the area, WRM installed temporary fencing and signage around the affected area (Figure 5) in September 2005. Under the current conditions of industrial use and specific use of this site area, we maintain that human exposures are controlled.

5.0 Site wide Groundwater Volatilization

Human exposure to VOCs in groundwater for this site, although not occurring, would be limited to migration of VOC vapors into overlying buildings since site groundwater is not used for human consumption or production. Groundwater at the WRM site is classified GB. Except for the northern area of the site, the majority of the site is paved. The RSR provides that if the groundwater is less than 15 feet from an occupied structure, the groundwater volatilization criteria (GWVC) will apply to the groundwater. In the case of WRM, the groundwater table varies from 7 to 15 feet below the ground surface across the site. Since these levels may be less than 15 feet under the occupied buildings at some time during the year, volatilization as a potential human exposure was evaluated. In addition to the wells on the northwest part of the site associated with the former surface impoundments (SWMU # 8, NCAPS # 1) numerous groundwater monitoring wells have been installed and sampled statewide. These include wells installed during the Phase II and Phase III and supplemental investigations. Several wells have also been installed inside the mill building in 2004 and have been analyzed for VOCs in 2005 under the supplemental investigation. All data up through the Phase III investigation groundwater monitoring well sampling is presented in Table 3 in Appendix B. New VOC data from the supplemental Phase III investigation collected in April 2005 is provided in Table 3A.

5.1 SAMPLING AND ANALYSIS

Wells that were sampled and analyzed during the Phase III ESA included MW-1, MW-3, MW-4, MW-5, MP-1, MP-3, MP-4, MP-6, MP-7, MP-8, MP-9, MP-10, MP-11, MP-12, MP-13, MP-14, MP-15, MP-16 (starting in second round), HA-1MW, HA-2MW, HA-3MW, and HA-4MW (see Figure 2). Wells sampled and analyzed for VOCs as a result of a supplemental Phase III investigation included M-28, MP-30, MP-31, MP-32, MP-33, MP-34, MP-35, MP-36, MP-37, MP-38, MP-39 and MP-40. Wells located hydraulically upgradient and in close proximity to the main building include MP-9, MP-8, MP-7, MP-15, MP-14, MW-3, MP-3 and MP-6. Wells on the hydraulically downgradient south side of the main mill building but hydraulically upgradient of ancillary buildings include MP-10, MP-11, MP-12, MP-1, HA-4MW, and HA-2MW. Wells installed inside the mill

building consist of MP-27 through MP-37. Wells installed during the supplemental phase III investigation in March of 2005 include MP-38 through MP-40.

Wells were also sampled for total and dissolved metals of concern including cadmium, copper, lead, nickel and zinc; VOCs by USEPA Method # 8260; and ETPH. Wells associated with the former PCB storage shed were also analyzed for PCB by USEPA Method # 8082. Depth to groundwater and light non-aqueous phase liquid (LNAPL) thickness measurements (if any) were obtained at the time of sample collection. The following discussion focuses on VOCs in groundwater.

5.2 BAGHOUSE STORAGE AREA

Groundwater monitoring wells MP-7 and MP-8 were installed to the east and west of the bag house storage area and are hydraulically up gradient of the main mill building. The down gradient direction is generally southeasterly toward the adjacent main mill building. Trace concentrations of 1,1,1-trichloroethane, 1,1-dichloroethane and trichloroethene were detected in well MP-7 below regulatory standards. No VOCs were detected in MP-8.

5.3 FORMER WASTE OIL STORAGE PAD

Monitoring wells MP-9 and MP-10 were installed north and south, respectively, of the waste oil storage pad. Well MP-11, a deep well, was also installed alongside well MP-10 at this location. Based on the newer site wide information regarding shallow groundwater flow directions, both MP-9 and MP-10 are lateral to shallow groundwater flow at the former waste oil storage pad.

Chlorinated VOCs were detected at trace concentrations in MP-10 in the July and December sample round. Cis-1,2-dichloroethene was detected at 3.5 ug/l and trichloroethene was detected at 5.5 ug/l in July and only trichloroethene was detected at 0.61 ug/l in the December sample round.

Some VOCs were detected in well MP-11 at low concentrations consisting of 1,1-dichloroethane, acetone, chloroform, cis-1,2-dichloroethene, MTBE, tetrachloroethene (PCE) and trichloroethene (TCE). The concentrations of TCE in the three sample rounds were 38 ug/l, 35 ug/l and 38 ug/l, respectively, below the industrial GWVC (IGWVC) of 67 ug/l.

5.4 UNDERGROUND STORAGE TANK AREAS

5.4.1 USTs A1-B4 and C5

Wells MW-3, and MP-3 were sampled near the former underground storage tank (UST) area (B4, B3, A2, A1) and UST area C5. Well MP-6 that is laterally side gradient to the USTs was also sampled. Wells sampled to characterize groundwater conditions associated with USTs C5 and UST area A1-B4 included MP-3, MW-3, MP-6, MP-14, MP-22, MP-23, MP-24 and MP-40. Wells MP-22, MP-23 and MP-24 have not been analyzed for VOCs. Based on the current understanding of groundwater flow directions determined on-site (shown in Figure 3), MP-14, MP-3, MP-22 and MP-23 are lateral to these UST areas and MW-3 is up gradient to these former tank areas.

VOCs were not detected in MW-3, in any sample rounds, consistent with results from the RCRA groundwater monitoring. Traces of several VOCs were also detected in well MP-3 including 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene and naphthalene not exceeding any GWVC.

In well MP-40 (sampled in April 2005) concentrations of VOCs were detected that are indicative of fuel oil. These constituents consisted of 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, benzene, ethylbenzene, isopropylbenzene, xylene naphthalene and n-propylbenzene. All of these compounds did not exceed applicable volatilization criteria.

VOC were detected in MP-6 at trace concentrations none of which exceed either a SWPC or an applicable GWVC. The VOCs were similar in composition to those detected in

MP-3, including 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, naphthalene and trichloroethene. Various other VOCs detected in this well were all indicative of fuel oil constituents.

Somewhat higher concentrations of VOCs were detected in well MP-14 relative to MW-3, MP-3 and MP-6 although no concentrations exceed any regulatory criteria. The only chlorinated VOC detected in MP-14 was 1,1-dichloroethane at 2.3 ug/l, 2.1 ug/l and 1.7 ug/l not exceeding any regulatory criteria. In well MP-14, a light non-aqueous phase liquid (LNAPL) was encountered during the sampling event in the three sample rounds. LNAPL measurements were 1.69, 5.47, and 6.5 feet respectively in the three sample rounds. There are no non-industrial receptors or exposures associated with this well.

5.4.2 USTs D6/E7 and F8 (AOC # 4, AOC # 13a) Results

Groundwater was sampled at wells MP-1, MP-12, HA-1MW, HA-2MW, HA-3MW, and HA-4MW, MP-38 and MP-39 in association with UST area tanks D6/E7 and F8 (see Figure 2). VOCs in these wells were detected at trace concentrations not exceeding any regulatory criteria

Well MP-12 is located lateral to the D6/E7 closed tank area. 1,1,1-trichloroethane was detected in MP-12 at concentrations of 0.5 ug/l, 1.4 ug/l and 0.79 ug/l in the three rounds. PCE was also detected below regulatory standards in this well at trace concentrations of 4.3 ug/l, 0.78 ug/l and 0.54 ug/l in the three respective sample rounds. These trace concentrations are not indicative of the former UST contents and are indicative of lateral groundwater conditions to these UST areas.

Well HA-1MW, located roughly 120 feet down gradient of the abandoned tank area, contained VOCs at generally low concentrations similar to fuel oil constituents and no chlorinated VOCs were detected. VOCs consisted of 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, and naphthalene at concentrations below applicable GWVC.

VOCs indicative of fuel oils were also detected in HA-2MW at trace levels below applicable GWVC. Chlorinated VOCs were not detected in HA-2MW.

Well HA-3MW, located 50 feet east of well HA-1MW contained trace concentrations of VOCs that included 1,2,4-trimethylbenzene at 54 ug/l, 50 ug/l and 46 ug/l. 1,3,5-trimethylbenzene was detected at 15 ug/l, 11 ug/l and 13 ug/l, naphthalene was detected at 39 ug/l, 24 ug/l and 23 ug/l in the three sampling rounds. These concentrations were all below applicable GWVC, and chlorinated VOCs were not detected.

In well HA-4MW, located 100 feet west of HA-2MW a trace of chloroform and methylene chloride were the only VOCs detected and were at concentrations below applicable GWVC.

5.4.3 UST Areas Conclusions

Groundwater monitoring wells sampled near the UST areas focused on TPH and VOC residues. There is no standard for TPH in groundwater in a GB classified area. Some wells drilled directly alongside former tank areas had measurable levels of LNAPL. LNAPL was measured in all wells and only those with detectable amounts were recorded. In well MP-1, roughly 0.25 feet was detected and in well MP-3 roughly 0.33 feet was detected. Well MP-14 also had significant measurable product, roughly 5 feet. Recently installed interior monitoring wells also contained significant thicknesses of LNAPL. These wells consist of MP-27, MP-28, MP-29, MP-30, MP-31, MP-32, MP-33 and MP-34. Generally the extent of LNAPL on the groundwater beneath the mill building has been delineated to the extent to design a recovery system. Other wells located down gradient or near former UST areas that had significant concentrations of TPH but no measurable product included HA-3MW, HA-1MW, HA-2MW, HA-4MW and MP-6. The CTDEP requires any LNAPL to be removed to the fullest extent practicable. There are no non-industrial receptors or exposures resulting from the LNAPL detected in the monitoring wells.

5.5 PCB STORAGE SHED (SWMU # 3, NCAPS # 14)

Trace concentrations of the chlorinated VOCs 1,1,1-trichloroethane and 1,1-dichloroethane were detected in wells MP-15 and MP-7. VOCs indicative of fuel oil constituents only were detected in MP-14. No VOCs detected exceeded applicable GWVC.

5.6 NORTH SECTION OF SITE (SWMU # 13)

Wells sampled in the northern section of the site consisted of MW-1, MW-4, MW-5, and MP-4. VOCs detected in MW-1 consisted of cis-1,2-dichloroethene at trace levels of 1.4 ug/l, 3.0 ug/l and 3.1 ug/l in the sample rounds. TCE was detected at concentrations of 24 ug/l, 9.1 ug/l and 17 ug/l, below any regulatory standard for this site. Vinyl chloride was detected in the second and third sample round both at a concentration of 3.3 ug/l that exceeds the RGWVC of 1.6 ug/l. The concentration of vinyl chloride in this well was the only compound detected that exceeded a standard for VOC on the entire site. This concentration of vinyl chloride was not reproduced in any wells located down gradient of MW-1 or closer to the main facility building. In well MW-4, VOCs were not detected. In well MP-4, located 70 feet south of MW-4, TCE was detected at concentrations ranging from 0.79 ug/l to 0.94 ug/l not exceeding any applicable criteria.

In well MW-5, TCE was detected in the July sample round at 0.57 ug/l, below applicable GWVC.

5.6.1 Southeast Corner of Site

The wells on the southeast corner of the site, MP-13 (deep) and MP-16 indicate a vertically downward flow gradient in this area. TCE was detected in MP-13 at 110 ug/l, 120 ug/l and 110 ug/l in three sample rounds. The shallow well clustered with MP-13 is HA-3MW. Low concentrations of VOCs indicative of fuel oil were detected in HA-3MW below applicable GWVC. Lesser concentrations of specific VOCs detected in MP-13 included 1,1,1-trichloroethane, 1,1-dichloroethane, 1,1-dichloroethene, and cis 1,2-dichloroethene. VOC concentrations detected in well MP-13 are indicative of a regional

Malcolm Pirnie, Inc. believes
A.J.

groundwater condition. There are no non-industrial receptors or exposures associated with these wells. In well MP-16, VOCs were not detected in two sample rounds.

5.7 INTERIOR GROUNDWATER MONITORING FOR VOCs

Sampling of interior groundwater monitoring wells MP-28, MP-30, MP-31, MP-32, MP-33, MP-35, MP-36, and MP-37 for VOCs occurred in April of 2005. The interior groundwater samples in the northeast section of the mill were collected from below a layer of historic LNAPL that is present on the groundwater table. The groundwater samples in wells MP-27 through MP-35 contained VOC constituents consistent with fuel oil at concentrations that did not exceed the industrial GWVC. Chlorinated VOCs were not present in any of these groundwater samples. These results are shown on Table 3.

5.8 DEEPER TRANSMISSIVE ZONES

Chlorinated VOCs were detected in deep well MP-13 at the southeast corner of the site exceeding the new proposed IGWVC. This has been the case in several other deeper wells on the site including MP-11, MW-6, MW-7 and MW-10. Furthermore, wells MW-6, MW-7 and MW-10 are generally located on the up gradient end of the site. GWVC are not applicable to water quality data from deeper horizon monitoring wells such as those at WRM where 60 to 70 feet of saturated overburden overlie the interval sampled.

The widespread detection of chlorinated VOCs in deeper groundwater across the site most likely reflects a regional problem not associated with WRM. The VOCs have been detected at well locations throughout the site, including the up gradient deeper horizon well MW-10. The detected concentrations of VOCs are roughly equivalent at the various locations and do not reveal any increases in concentration on-site that would be indicative of a local source or a plume originating on-site. Concentrations in the deeper horizon wells are greater than the concentrations in the water table wells that demonstrate that no shallow source of VOCs was introduced on-site. Furthermore, in the north end of the site, earlier Appendix IX testing of VOCs in shallow soil did not determine any

shallow soil contamination of VOCs. There has been no documented significant use on-site of the VOCs detected in the deeper horizon wells, and no source of VOCs in soil on-site as defined by detected concentrations in soil exceeding GBPMC. We conclude that there is no basis for attributing the VOCs detected in the deeper horizon to any potential releases from the WRM facility.

The potential pathways are volatilization, discussed above, and discharge to either a receiving surface water body or to shallow groundwater. The most recent VOC concentrations in groundwater at deeper wells MP-11 and MP-13, which were specifically mentioned in the comment, are below the existing RGWVC and slightly above the proposed R/IGWVC for TCE only, even though they are not subject to these criteria based on the well screen depths. Furthermore, there are no downgradient receptors or exposures for the deep groundwater prior to discharge at the Naugatuck River. Thus, the completed exposure pathway to humans (volatilization from groundwater) does not exist.

Conclusions regarding screening for human exposures are deferred to the individual checklists provided in the Human Exposures Assessment.

6.0 Volatile Organic Compound Exposure Assessment

It is recognized that the presence of VOCs at any SWMU, AOC or NCAPS area is a potential concern with regard to human exposure through inhalation. Each of these areas is assessed on Tables 4 and 5 (provided in Appendix B). The tables are further explained in narrative below. It is noted that there are no non-industrial receptors present at the WRM site or in any direction hydraulically downgradient of the site.

6.1 METHODOLOGY

The complete list of SWMU's, AOCs and NCAPS were initially assessed with regard to usage or potential presence of VOCs on Table 4. The tables are designed to be read from left to right, each successive column to the right expanding on the information for a given area that may have been subjected to VOCs over the history of the facility. If VOCs were not present at any particular SWMU, AOC or NCAPS area, the subsequent columns are not completed. If VOCs have a history of usage or presence at any particular SWMU, AOC or NCAPS area, the source of the VOC is classified as either; related to fuel storage, an active process or a waste storage area. Under these classifications, it is also determined if a VOC release to the environment has or may have occurred. The final column on Table 4 refers the reader to Table 5 for additional information or provides a statement that VOCs are not a concern for this item. Table 5 is reserved for SWMUs, AOCs or NCAPS areas for which VOC are present and releases to the environment are unknown, have occurred or may have occurred. Table 5 further specifies if the area is located inside or outside and if it is portable or stationary, in use or not, and whether further investigation is warranted. A determination is made in Table 5 whether VOC residues are present in soil or unknown and if there is a potential for migration of VOCs to indoor ambient air.

6.2 CONCLUSIONS

A total of five (5) SWMUs (#1), AOCs (#3, # 5, # 13b) and NCAPS (# 12) areas were identified where VOCs were or may have been present at some point in the known

history of the facility. AOC # 5 consists of solvent parts washers that were located at four separate areas. These parts washers may not have all been in use at the same time or all present at the same time. The parts washer located in the maintenance area (machine shop) referred to in AOC # 5 has also been identified as NCAPS area # 12 (machine shop). The reference to the machine shop by the NCAPS area review specified the parts washer at that area. Therefore a total of seven (7) areas in the facility with potential for presence of VOCs have been identified. Of these areas, four (4) consist of the parts washer areas, two (2) are former underground storage tanks that contained gasoline and one (1) is a waste storage pad where drums of waste oil were once stored prior to shipment for disposal. The results for all these areas indicate that **human exposures are controlled** as explained on Table 5.

7.0 Groundwater Migration Off-Site

7.1 INTRODUCTION/BACKGROUND

In October 2003, representatives of WRM/OLIN met with CTDEP personnel to discuss CTDEP's concern about a potential breakthrough of LNAPL into Steele Brook from the former LEA Manufacturing property (now referred to as the AREV property) directly south of the WRM property. As a result of the meeting, WRM voluntarily agreed to investigate the limit of a LNAPL plume adjacent to Steele Brook, on the western end of the AREV property, and to implement measures necessary, if any, to preclude such a breakthrough into Steele Brook. In connection with this effort, USEPA expressed a desire to include an additional evaluation regarding risk of human exposure for offsite migration of groundwater from WRM. There are no non-industrial receptors in a hydraulically downgradient direction from the WRM site to the groundwater discharge at the Naugatuck River.

To address this human exposure EI, a data evaluation was performed for monitoring wells on the southern and hydraulically down gradient portion of the WRM site and also the most hydraulically up-gradient wells on the bordering AREV site located to the south of the WRM site. The two sites are located in a GB classified groundwater area and no site groundwater is used for drinking purposes. In accordance with the RSR, the groundwater volatilization criteria are applicable to these two sites and will be evaluated under this EI report. The groundwater flow direction across the WRM site is to the south toward the Naugatuck River, based on the most current mapping from all available wells.

WRM's voluntary investigation of LNAPL on the AREV property has focused on groundwater but WRM understands from Mr. Harold Bobowicz of the CTDEP, apparently the CTDEP reconnoitred a length of stream bank along the eastern side of Steele Brook adjacent to the AREV site and did not observe LNAPL or any other groundwater seeps to Steele Brook or to sediments along the banks of the Brook.

7.2 RESULTS

Results from the WRM wells closest to the southern boundary of the WRM site, located across the front of the property, were evaluated for the presence of VOCs in groundwater. From east to west across the southern part of the WRM property, wells evaluated for the presence of VOCs consisted of MP-16, HA-3MW, MP-17, HA-1MW, MP-18, MP-19, MP-20, HA-2MW, HA-4MW and MP-21. Wells MP-16 and HA-1MW, HA-2MW, HA-3MW and HA-4MW were sampled and analyzed during the Transfer Act related Phase III investigation in July, September and December of 2002 using USEPA Method #8260. Wells HA-3MW, MP-17, HA-4MW, MP-18, MP-19, MP-20 and MP-21 were also sampled for VOCs in April of 2004 by USEPA Method #8260. Wells located south of East Aurora Street that were sampled and analyzed included (from east to west) MW-A (located on Albert Brothers Scrap Yard), MW-11, MW-6, MW-7, MW-8, MW-15, MW-14 (located on the AREV property in yard farther south of East Aurora Street), MW-10, MW-9 and B1-MW (closest to Steele Brook). These wells south of East Aurora Street provide VOC screenings that exemplify a worse case scenario (expected highest VOC concentrations) for groundwater migrating onto the AREV site from the WRM site. The analytical results for all wells discussed are provided in Table 6.

7.2.1 WRM Well Results

The groundwater results associated with the WRM Phase III Investigation at the site in 2002 addressed the potential for human exposures due to offsite migration of VOC in groundwater. Well HA-1MW, located roughly 120 feet down gradient of the closed underground storage tank areas D6/E7, contained VOCs at generally low concentrations indicative of fuel oil constituents. VOCs detected in HA-1MW consisted of 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, and naphthalene at concentrations below industrial groundwater volatilization criteria (IGWVC). VOCs indicative of fuel oils were also detected in HA-2MW at trace levels below RGWVC. Well HA-3MW, located 50 feet east of well HA-1MW contained trace concentrations of VOCs that included 1,2,4-trimethylbenzene at 54 ug/l, 50 ug/l and 46 ug/l in the three sample rounds in 2002. 1,3,5-trimethylbenzene was detected in HA-3MW at 15 ug/l, 11 ug/l and 13 ug/l, and naphthalene was detected in that well at 39 ug/l, 24 ug/l and 23 ug/l in the three sampling rounds. In well HA-4MW, located 100 feet west of HA-2MW, chloroform was detected

at concentrations of 9.7 ug/l, 18 ug/l and 15 ug/l in the three sample rounds, all of which are below the RGWVC of 26 ug/l. Methylene chloride was also detected at trace levels in this well but the detected levels were far below the RGWVC.

During the sampling performed in April 2004, VOCs associated with fuel oils were detected at concentrations that did not exceed any health based risk criteria. In well HA-3MW, 1,2,4-trimethylbenzene was detected at a concentration of 29 ug/l, 1,3,5-trimethylbenzene was detected at a concentration of 9.2 ug/l, naphthalene was detected at a concentration of 39 ug/l (no criterion exists for this semi-volatile organic compound) and total xylene was detected at 8.3 ug/l. In well MP-17, only naphthalene was detected in groundwater at a concentration of 11 ug/l. In well HA-4MW, no VOCs were detected. In well MP-18, naphthalene was detected at a concentration of 22 ug/l. VOCs were not detected in MP-19, MP-20 or MP-21.

7.2.2 Offsite AREV Well Results

In well MW-A, groundwater was sampled by Malcolm Pirnie during two sampling events in February and April of 2004. All VOC concentrations in well MW-A were below applicable volatilization criteria and were indicative of fuel oils. The higher VOC concentrations detected during these two rounds consisted of benzene at 1.9 ug/l, isopropylbenzene at 7.1 ug/l, naphthalene at 6.1 ug/l, sec-butylbenzene at 4.3 ug/l and tert-butylbenzene at 1.2 ug/l. In wells MW-11, VOC concentrations did not exceed IGWVC in either sample round. Trace concentrations of 1,2,4-trimethylbenzene, benzene, isopropylbenzene, naphthalene, n-butylbenzene, n-propylbenzene, sec-butylbenzene, and tert-butylbenzene were detected below all respective IGWVC. In well MW-6, concentrations of 1,2,4-trimethylbenzene, benzene, isopropylbenzene, naphthalene, n-butylbenzene, n-propylbenzene, sec-butylbenzene, and tert-butylbenzene were also detected below all respective IGWVC. In well MW-7, concentrations of 1,2,4-trimethylbenzene, benzene, isopropylbenzene, naphthalene, n-butylbenzene, n-propylbenzene, sec-butylbenzene, and tert-butylbenzene were also detected below all respective IGWVC. In well MW-8, concentrations of 1,2,4-trimethylbenzene, isopropylbenzene, naphthalene, n-butylbenzene, n-propylbenzene, sec-butylbenzene, and tert-butylbenzene were also detected below all respective IGWVC. In well MW-15,

concentrations of 1,2,4-trimethylbenzene, isopropylbenzene, naphthalene, n-butylbenzene, n-propylbenzene, sec-butylbenzene, and tert-butylbenzene were also detected below all respective IGWVC. In well MW-14, concentrations of 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, isopropylbenzene, naphthalene, n-propylbenzene were detected at trace concentrations below all respective IGWVC. In well MW-10, trace concentrations of VOCs detected consisted of isopropylbenzene, n-butylbenzene, n-propylbenzene, sec-butylbenzene, and tert-butylbenzene. In well MW-9, trace concentrations of VOCs detected consisted of 1,3,5-trimethylbenzene, benzene, isopropylbenzene, n-butylbenzene, n-propylbenzene, sec-butylbenzene, and tert-butylbenzene. All concentrations in MW-9 and MP-10 were far below IGWVC. In monitoring well B1-MW, only naphthalene was detected in two of three sample rounds at trace concentrations of 1.5 ug/l and 1.3 ug/l.

Based on the results of VOC concentrations in groundwater from the WRM and AREV wells adjacent to East Aurora Street discussed above, it is determined that VOCs in groundwater pose no threat of human exposure because the detected concentrations on-site are below the most stringent risk-based health standards for groundwater volatilization. Furthermore, there are no non-industrial receptors that exist in this area from the southern boundary of the WRM property to the groundwater discharge point at the Naugatuck River.

LNAPL is present at thicknesses of less than one foot in some of the wells on the offsite AREV property, but that material will be recovered by a system to be installed in 2005. Furthermore, no non-industrial receptors exist in the area of the observed LNAPL in the area between the south end of the WRM property and the Naugatuck River or Steele Brook. This includes but is not limited to schools, libraries, hospitals, hotels or stores.

8.0 Conclusions

Based on the December 1999 EIE, SWMU # 3, SWMU # 13, and groundwater volatilization remained as potential human exposure concerns. Additional data were collected for these 3 items and an interim remedy was implemented at one. SWMU #13 soil data collected during the supplemental Phase III investigation indicated an exceedence for a direct exposure criterion for copper. As stated previous, this area is fenced and not accessible to workers or pedestrians posing no threat of exposure. Based on the additional data presented in this report and actions undertaken, it is concluded that the WRM site is **stabilized with respect to human exposures**. Each area is discussed briefly.

8.1 SWMU # 3 PCB STORAGE SHED

The PCB storage shed pad and associated soil has recently been characterized for PCB and an interim remedy implemented. The results indicate residual concentrations of PCB exist in soils at this location beneath a concrete floor that precludes human exposures. The 4 inch thick concrete floor was re-poured in November 26th, 2001 over the affected soil within the covered raised storage area and is protective of human exposure. It is concluded that SWMU # 3 is **controlled for human exposures**.

8.2 SWMU # 13 HISTORIC LANDFILL

The delineation of SWMU # 13 as a discrete feature appears to be based on its topographical expression, rather than any uniquely distinctive textural or chemical composition. The North End Landfill appears to have been initially identified because of its hummocky terrain, ungraded fill piles, scrub vegetation and exposed debris at the surface. By comparison, the site area immediately to the south has been uniformly graded, is free of visible debris and supports a maintained lawn. It is our understanding that this distinction was created in association with site improvements during closure of the surface impoundment (SWMU # 8) immediately to the south. A review of the boring and test pit logs, field observations, and the substantial analytical data results for samples

obtained both within and outside of SWMU # 13, indicates that the subsurface materials are similar and cannot be discriminated based upon chemical constituent or physical composition. SWMU # 13 appears to be a relict of more widespread historic industrial filling throughout the north end of the site and unique only in its surficial appearance. In summary, substantial analytical data have been developed by H&A and MPI, characterizing the shallow soils throughout the northern end of the site and including SWMU # 13. These investigations have included drilling a total of fifteen (15) soil borings, excavating four test pits, and analyses for indicator constituents in a larger number of samples and analyses of Appendix IX constituents in a subset of samples. One sample from SWMU #13 exceeded the IDEC for copper during the supplemental phase III investigation in April of 2005 (Appendix F), but did not exceed the pollutant mobility criteria. This area therefore will require remedy for shallow soil. None of the data obtained report concentrations for any constituent analyzed above the IDEC or above the GBPMC. These data support a determination that **SWMU # 13 does not represent a concern with respect to human exposure.**

8.3 GROUNDWATER VOLATILIZATION

Groundwater has been characterized site wide in conjunction with ongoing monitoring of the closed RCRA impoundment and in accordance with the Phase III ESA and supplemental investigation. The site wide VOC results do not exceed the RGWVC for wells having a water table within 15 feet from the ground surface. There is a regional condition in deep groundwater that has also affected the WRM site. Trichloroethene (TCE) has been detected in deep groundwater wells at concentrations that exceed industrial GWVC (IGWVC). The shallow clustered wells at the same locations as these deep wells, did not exceed any applicable volatilization criteria. Furthermore, there are no releases from WRM that exceed the volatilization criteria in non-industrial settings, as discussed in Section ~~8.2~~^{7.2} above, because there are no non-industrial receptors downgradient of the WRM site. _{a.d.}

During the Phase III ESA, several new shallow wells were installed site wide and two additional deep wells were installed and sampled. The wells were located in proximity to

the SWMUs and AOCs where other releases had occurred. The wells were also installed to fill data gaps so that groundwater for the entire site could be characterized for constituents of concern, including VOCs. No VOCs were detected above applicable volatilization criteria in shallow groundwater anywhere on the WRM site.

The current analytical results for VOCs in groundwater support the conclusion that **human exposures from ground water volatilization are controlled.**

MPI has also evaluated the potential for offsite migration of groundwater and risk of human exposure for VOCs in groundwater. Several wells were sampled on the hydraulically down gradient border of the WRM site and on the adjacent AREV site. Trace concentrations of fuel oil constituents were detected in several of these wells at low concentrations that pose no health risk. Furthermore there are no buildings or non industrial receptors present in the areas where these wells were installed and where the observations of LNAPL on the groundwater table were made.

8.4 VOLATILE ORGANIC COMPOUND EXPOSURE ASSESSMENT

In order to address the question of human exposures due to volatilization from on-site sources, WRM has performed an assessment at all SWMUs, AOCs and NCAPS areas for the presence or use of VOC containing materials. This assessment has identified seven areas that previously used VOC containing materials. Based on the latest and recent review of these areas and investigations on-site since the last submission of the CA-725 EI, **no areas were identified that indicated human exposures to VOCs.**

Current Human Exposures Under Control

Facility Name: Waterbury Rolling Mills, Inc.
Facility Address: 240 East Aurora Street
Facility EPA IID #: Waterbury, Connecticut 06708

1. Has all available relevant/significant information on known and reasonably suspected releases to soil, groundwater, surface water/sediments, and air, subject to RCRA Corrective Action (e.g., from Solid Waste Management Units (SWMU), Regulated Units (RU), and Areas of Concern (AOC)), been considered in this EI determination?

If yes - check here and continue with #2 below.

If no - re-evaluate existing data, or

if data are not available skip to #6 and enter "IN" (more information needed) status code.

BACKGROUND

Definition of Environmental Indicators (for the RCRA Corrective Action)

Environmental Indicators (EI) are measures being used by the RCRA Corrective Action program to go beyond programmatic activity measures (e.g., reports received and approved, etc.) to track changes in the quality of the environment. The two EI developed to-date indicate the quality of the environment in relation to current human exposures to contamination and the migration of contaminated groundwater. An EI for non-human (ecological) receptors is intended to be developed in the future.

Definition of "Current Human Exposures Under Control" EI

A positive "Current Human Exposures Under Control" EI determination ("YE" status code) indicates that there are no "unacceptable" human exposures to "contamination" (i.e., contaminants in concentrations in excess of appropriate risk-based levels) that can be reasonably expected under current land- and groundwater-use conditions (for all "contamination" subject to RCRA corrective action at or from the identified facility (i.e., site-wide)).

Relationship of EI to Final Remedies

While Final remedies remain the long-term objective of the RCRA Corrective Action program the EI are near-term objectives which are currently being used as Program measures for the Government Performance and Results Act of 1993, GPRA). The "Current Human Exposures Under Control" EI are for reasonably expected human exposures under current land- and groundwater-use conditions ONLY, and do not consider potential future land- or groundwater-use conditions or ecological receptors. The RCRA Corrective Action program's overall mission to protect human health and the environment requires that Final remedies address these issues (i.e., potential future human exposure scenarios, future land and groundwater uses, and ecological receptors).

Duration / Applicability of EI Determinations

EI Determinations status codes should remain in RCRIS national database ONLY as long as they remain true (i.e., RCRIS status codes must be changed when the regulatory authorities become aware of contrary information).

Site-Wide

2. Are groundwater, soil, surface water, sediments, or air media known or reasonably suspected to be "contaminated" above appropriately protective risk-based "levels" (applicable promulgated standards, as well as other appropriate standards, guidelines, guidance, or criteria) from releases subject to RCRA Corrective Action (from SWMUs, RUs or AOCs)?

	YES	No	?	Rationale / Key Contaminants
Groundwater	X			Cadmium, Chloride, Chromium, Copper, Iron, Lead, Manganese, Nickel, Sodium, Sulfate, Zinc, 1,1,1 Trichloroethane, 1,1 Dichloroethane, cis 1,3 Dichloropropene, 1,2,4 Trimethylbenzene, 1,3,5 Trimethylbenzene, Acetone, Benzene, Bromoform, 2-Butanone, Chloroform, Dibromochloromethane, cis 1,2 Dichloroethene, Ethylbenzene, Isopropylbenzene, Isopropyltoluene, Xylene, MTBE, Naphthalene, Butylbenzene, Isopropyltoluene, PCE, TCE, Toluene, Vinyl Chloride, and TPH.
Air (indoors) ²				
Surface Soil (e.g., <2 ft)	X			PCBs, TPH, Beryllium, Cadmium, Chromium, Copper, Lead, Nickel, Zinc, TCE, Toluene, Sulfuric Acid, and Hydrogen Peroxide
Surface Water	X			Sulfuric Acid, Hydrogen Peroxide, Chromium, Copper, Lead, Nickel, and Zinc
Sediment			X	
Subsurf. Soil (e.g., >2 ft)	X			Butanone, Butylbenzene, Ethylbenzene, Isopropylbenzene, Isopropyltoluene, 4-Methyl-2-Pentanone, Naphthalene, Trimethylbenzene, Toluene, Xylene, TCE, TPH, Copper, Lead, Nickel, and Zinc
Air (outdoors)				

___ If no (for all media) - skip to #6, and enter "YE," status code after providing or citing appropriate "levels," and referencing sufficient supporting documentation demonstrating that these "levels" are not exceeded.

X If yes (for any media) continue after identifying key contaminants in each "contaminated" medium, citing appropriate "levels" (or provide an explanation for the determination that the medium could pose an unacceptable risk), and referencing supporting documentation.

___ If unknown (for any media) skip to #6 and enter "IN" status code.

Rationale and Reference(s): Details of each release area referenced below are provided in the specific release summary forms.

Former Outside Drum Storage Area (SWMU #1): Releases to groundwater, surface soil, and subsurface soil.

Baghouse Storage Area (SWMU #2): Releases to groundwater, surface soil, and subsurface soil.

PCB Storage Shed (SWMU #3): Releases to groundwater and surface soil.

Former Surface Impoundment Area (SWMU #8 & NCAPS #1): Releases to groundwater and subsurface soil.

Historic Landfill Area (SWMU #13): Releases to groundwater, surface soil, and subsurface soil.

Former Tanks by Accounting Office Area (AOC #3): Releases to groundwater, surface soil, and subsurface soil.

Former Tanks Near Maintenance Area (AOC #4): Releases to groundwater, and subsurface soil.

Former Tanks Near Railroad Tracks (AOC #11): Releases to groundwater, surface soil, and subsurface soil.

Fuel Oil UST (AOC #13a): Releases to groundwater and subsurface soil.

Former 4,000 gallon Diesel/Gasoline Tank (AOC #13b): Releases to groundwater and subsurface soil.

Pickling Lines (NCAP #4): Releases to surface soil and surface water.

Footnotes:

¹ "Contamination" and "contaminated" describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriately protective risk-based "levels" (for the media, that identify risks within the acceptable risk range).

² Recent evidence (from the Colorado Dept. of Public Health and Environment, and others) suggest that unacceptable indoor air concentrations are more common in structures above groundwater with volatile contaminants than previously believed. This is a rapidly developing field and reviewers are encouraged to look to the latest guidance for the appropriate methods and scale of demonstration necessary to be reasonably certain that indoor air (in structures located above (and adjacent to) groundwater with volatile contaminants) does not present unacceptable risks.

**Current Human Exposures Under Control
Environmental Indicator (EI) RCRIS code (CA725)**

Site-Wide

3. Are there **complete pathways** between “contamination” and human receptors such that exposures can be reasonably expected under the current (land- and groundwater-use) conditions?

Summary Exposure Pathway Evaluation Table

<u>Contaminated Media</u>	Potential <u>Human Receptors</u> (Under Current Conditions)						
	Residents	Workers	Day-Care	Construction	Trespassers	Recreation	Food
Groundwater	<u>NO</u>	<u>NO</u>	<u>NO</u>	<u>NO</u>	<u>NO</u>	<u>NO</u>	<u>NO</u>
Air (indoors)	<u>--</u>	<u>--</u>	<u>--</u>	<u>--</u>	<u>--</u>	<u>--</u>	<u>--</u>

Instructions for Summary Exposure Pathway Evaluation Table:

1. Strike-out specific Media including Human Receptors' spaces for Media which are not “contaminated”) as identified in #2 above.
2. enter “yes” or “no” for potential “completeness” under each “Contaminated” Media -- Human Receptor combination (Pathway).

Note: In order to focus the evaluation to the most probable combinations some potential “Contaminated” Media - Human Receptor combinations (Pathways) do not have check spaces (“___”). While these combinations may not be probable in most situations they may be possible in some settings and should be added as necessary.

 X If no (pathways are not complete for any contaminated media-receptor combination) skip to #6, and enter “YE” status code, after explaining and/or referencing condition(s) in-place, whether natural or man-made, preventing a complete exposure pathway from each contaminated medium (e.g., use optional Pathway Evaluation Work Sheet to analyze major pathways).

 If yes (pathways are complete for any “Contaminated” Media Human Receptor combination) continue after providing supporting explanation.

 If unknown (for any “Contaminated” Media Human Receptor combination) skip to #6 and enter “IN” status code.

**Current Human Exposures Under Control
Environmental Indicator (EI) RCRIS code (CA725)**

Site-Wide

6. Check the appropriate RCRIS status codes for the Current Human Exposures Under Control EI event code (CA725), and obtain Supervisor (or appropriate Manager) signature and date on the EI determination below (and attach appropriate supporting documentation as well as a map of the facility):

- YE** - Yes, "Current Human Exposures Under Control" has been verified. Based on a review of the information contained in this EI Determination, "Current Human Exposures" are expected to be "Under Control" at the Waterbury Rolling Mills, Inc. facility, EPA ID # CTD001164607 located at 240 Aurora Street, Waterbury, Connecticut under current and reasonably expected conditions. This determination will be re-evaluated when the Agency/State becomes aware of significant changes at the facility.
- NO** - "Current Human Exposures" are NOT "Under Control."
- IN** - More information is needed to make a determination.

Air (indoors) ²				
Surface Soil (e.g., <2 ft)	X			TPH, Copper, Lead, Nickel, and Zinc.
Surface Water				
Sediment				
Subsurf. Soil (e.g., >2 ft)	X			TPH, Copper, Lead, Nickel, and Zinc.
Air (outdoors)				

___ If no (for all media) - skip to #6, and enter "YE," status code after providing or citing appropriate "levels," and referencing sufficient supporting documentation demonstrating that these "levels" are not exceeded.

X If yes (for any media) continue after identifying key contaminants in each "contaminated" medium, citing appropriate "levels" (or provide an explanation for the determination that the medium could pose an unacceptable risk), and referencing supporting documentation.

___ If unknown (for any media) skip to #6 and enter "IN" status code.

Rationale and Reference(s):

Groundwater - Three rounds of Groundwater sampling have been completed at wells MP-9, MP-10, and MP-11 (2003 MPI ESA Phase III) with the following results: Cadmium (diss.) concentrations up to 0.012 mg/l; Cadmium (total) concentrations up to 0.014 mg/l; Copper (diss.) concentrations up to 0.39 mg/l; Copper (total) concentrations up to 0.51 mg/l; Zinc (diss.) concentrations up to 0.58 mg/l; Zinc (total) concentrations up to 0.57 mg/l and TCE concentrations up to 38 ug/l. Additionally, the following contaminants were detected in one of the three rounds of groundwater sampling: Total low-level Lead (0.58 mg/l); cis 1,3 Dichloropropene (3.5 ug/l); and TPH (0.49 mg/l).

Surface Soil - Thirteen cubic yards of stained soils were removed in 1994 (1999 GZA EI Report, pg 5). Post excavation sampled gathered at the time, indicated some of the remaining soils were in exceedances of CTDEP RDEC (916 mg/kg vs. 500 mg/kg) for TPH, but not CTDEP IDEC (2500 mg/kg). These soils were removed on the western edge of the SWMU. Following this excavation, the area was paved. Additional soil sampled were collected from the east, north, and southern sides of the SWMU at depths of 0'-2' below grade (2003 MPI ESA Phase III, pg 2-3). TPH concentrations in soil samples were found to be up to 1,600 mg/kg (2003 MPI ESA Phase III). Copper concentrations were found up to 1200 mg/kg (2003 MPI ESA Phase III). Lead concentrations were found up to 37 mg/kg (2003 ESA Phase III, Table 2). Nickel concentrations were found up to 72 mg/kg (2003 MPI ESA Phase III). Zinc concentrations were found up to 1400 mg/kg (2003 MPI ESA Phase III). There are no potential human exposures from this media because the entire area has been paved, thus rendering the underlying soil inaccessible.

Subsurface Soil - TPH concentrations in soil samples were found to be up to 4,900 mg/kg (2003 MPI ESA Phase III). Copper concentrations were found up to 1,500 mg/kg (2003 MPI ESA Phase III). Lead concentrations were found up to 37 mg/kg (2003 ESA Phase III, Table 2). Nickel concentrations were found up to 41 mg/kg (2003 MPI ESA Phase III, Table 2). Zinc concentrations were found up to 250 mg/kg (2003 MPI ESA Phase III). There are no potential human exposures from this media because the entire area has been paved, thus rendering the underlying soil inaccessible.

Footnotes:

¹ “Contamination” and “contaminated” describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriately protective risk-based “levels” (for the media, that identify risks within the acceptable risk range).

2B. Are groundwater, soil, surface water, sediments, or air media known or reasonably suspected to be "contaminated" above appropriately protective risk-based "levels" (applicable promulgated standards, as well as other appropriate standards, guidelines, guidance, or criteria) from releases subject to RCRA Corrective Action (from SWMUs, RUs or AOCs)?

	YES	No	?	Rationale / Key Contaminants
Groundwater	X			Cadmium, Copper, Nickel, Zinc, TCE 1,1,1 Trichloroethane, 1,1 Dichloroethane, Bromoform, Dibromochloromethane, Naphthalene, and TPH.
Air (indoors) ²				
Surface Soil (e.g., <2 ft)	X			Cadmium and Lead
Surface Water				
Sediment				
Subsurf. Soil (e.g., >2 ft)	X			Copper, Lead, Nickel, and Zinc.
Air (outdoors)				

— If no (for all media) - skip to #6, and enter "YE," status code after providing or citing appropriate "levels," and referencing sufficient supporting documentation demonstrating that these "levels" are not exceeded.

X If yes (for any media) continue after identifying key contaminants in each "contaminated" medium, citing appropriate "levels" (or provide an explanation for the determination that the medium could pose an unacceptable risk), and referencing supporting documentation.

— If unknown (for any media) skip to #6 and enter "IN" status code.

Rationale and Reference(s):

Groundwater - Three rounds of Groundwater sampling have been completed at wells MP-7 and MP-8 (2003 MPI ESA Phase III) with the following results: Cadmium (total) concentrations up to 0.0070 mg/l; Copper (diss.) concentrations up to 0.054 mg/l; Copper (total) concentrations up to 0.11 mg/l; Nickel (diss.) concentrations up to 0.20 mg/l; Nickel (total) concentrations up to 0.19 mg/l; Zinc (diss.) concentrations up to 0.58 mg/l; Zinc (total) concentrations up to 0.57 mg/l; 1,1,1 Trichloroethane concentrations up to 8.5 ug/l; 1,1 Dichloroethane concentrations up to 1.3 ug/l and TCE concentrations up to 38 ug/l. Additionally, the following contaminants were detected in one or two of the three rounds of groundwater sampling: Cadmium (diss.) concentrations up to 0.0072 mg/l; Naphthalene concentrations up to 0.94 ug/l; Bromoform (1.7 ug/l); Dibromochloromethane (0.57 ug/l); TCE (0.51 ug/l) and TPH (0.13 mg/l). There are no potential human exposures from this media because there have been no exceedances of the CTDEP GWVC and since the groundwater is not a drinking water supply.

Surface Soil - In 1994 a soil removal was performed from this area (1999 GZA EI Report, pg 6). At this time soil was removed to a depth of 2.5 feet in order to meet the TCLP remedial criteria for cadmium and lead. Following the soil removals, the entire area was paved. There are no potential human exposures from this media because the entire area has been paved, and because the surface soil has been replaced by clean backfill.

Subsurface Soil - Copper concentrations were found up to 7.200 mg/kg (2003 MPI ESA Phase III). Lead concentrations were found up to 290 mg/kg (2003 MPI ESA Phase III). Nickel concentrations were found up to 470 mg/kg (2003 MPI ESA Phase III). Zinc concentrations were found up to 4.300 mg/kg (2003 MPI ESA Phase III). There are no potential human exposures from this media because the entire area has been paved, thus rendering the underlying soil inaccessible.

Footnotes:

¹ "Contamination" and "contaminated" describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriately

protective risk-based “levels” (for the media, that identify risks within the acceptable risk range).

² Recent evidence (from the Colorado Dept. of Public Health and Environment, and others) suggest that unacceptable indoor air concentrations are more common in structures above groundwater with volatile contaminants than previously believed. This is a rapidly developing field and reviewers are encouraged to look to the latest guidance for the appropriate methods and scale of demonstration necessary to be reasonably certain that indoor air (in structures located above (and adjacent to) groundwater with volatile contaminants) does not present unacceptable risks.

Baghouse Storage Area (SWMU #2)

6B. Check the appropriate RCRIS status codes for the Current Human Exposures Under Control EI event code (CA725), and obtain Supervisor (or appropriate Manager) signature and date on the EI determination below (and attach appropriate supporting documentation as well as a map of the facility):

YE - Yes, "Current Human Exposures Under Control" has been verified. Based on a review of the information contained in this EI Determination, "Current Human Exposures" are expected to be "Under Control" at the Waterbury Rolling Mills, Inc. facility, EPA ID # CT D001164607 located at 240 Aurora Street, Waterbury, Connecticut under current and reasonably expected conditions. This determination will be re-evaluated when the Agency/State becomes aware of significant changes at the facility.

NO - "Current Human Exposures" are NOT "Under Control."

IN - More information is needed to make a determination.

PCB Storage Shed (SWMU #3)

2C. Are groundwater, soil, surface water, sediments, or air media known or reasonably suspected to be "contaminated" above appropriately protective risk-based "levels" (applicable promulgated standards, as well as other appropriate standards, guidelines, guidance, or criteria) from releases subject to RCRA Corrective Action (from SWMUs, RUs or AOCs)?

	YES	No	?	Rationale / Key Contaminants
Groundwater	X			Cadmium, Copper, Nickel, Zinc, 1,1,1 Trichloroethane, 1,1 Dichloroethane, 1,2,4 Trimethylbenzene, 1,3,5 Trimethylbenzene, Benzene, Ethylbenzene, Isopropylbenzene, Xylene, Naphthalene, Butylbenzene, Isopropyltoluene, Toluene, and TPH.
Air (indoors) ²				
Surface Soil (e.g., <2 ft)	X			PCBs and Copper
Surface Water				
Sediment				
Subsurf. Soil (e.g., >2 ft)				
Air (outdoors)				

— If no (for all media) - skip to #6, and enter "YE," status code after providing or citing appropriate "levels," and referencing sufficient supporting documentation demonstrating that these "levels" are not exceeded.

X If yes (for any media) continue after identifying key contaminants in each "contaminated" medium, citing appropriate "levels" (or provide an explanation for the determination that the medium could pose an unacceptable risk), and referencing supporting documentation.

— If unknown (for any media) skip to #6 and enter "IN" status code.

Rationale and Reference(s):

Groundwater - Three rounds of Groundwater sampling have been completed at wells MP-14 and MP-15 (2003 MPI ESA Phase III) with the following results: Cadmium (diss.) concentrations up to 0.01 mg/l; Cadmium (total) concentrations up to 0.01 mg/l; Copper (diss.) concentrations up to 0.054 mg/l; Copper (total) concentrations up to 0.11 mg/l; Nickel (diss.) concentrations up to 0.075 mg/l; Nickel (total) concentrations up to 0.053 mg/l; Zinc (diss.) concentrations up to 0.21 mg/l; Zinc (total) concentrations up to 0.31 mg/l. Additionally, the following contaminants were also detected in all three rounds of groundwater sampling: 1,1,1 Trichloroethane concentrations up to 9.7 ug/l; 1,1 Dichloroethane concentrations up to 2.4 ug/l; 1,2,4 Trimethylbenzene concentrations up to 240 ug/l; 1,3,5 Trimethylbenzene concentrations up to 68 ug/l; Benzene concentrations up to 1.1 ug/l; Ethyl Benzene concentrations up to 71 ug/l; Isopropylbenzene concentrations up to 15 mg/l; m/p Xylene concentrations up to 180 ug/l; Naphthalene concentrations up to 390 ug/l; n-Butylbenzene concentrations up to 8.3 ug/l; n-Propylbenzene concentrations up to 24 ug/l; o-Xylene concentrations up to 13 ug/l; p-Isopropyltoluene concentrations up to 3.8 ug/l; sec-Butylbenzene concentrations up to 5.3 ug/l; tert-Butylbenzene concentrations up to 1.5 ug/l; and Toluene concentrations up to 2.4 ug/l. Finally, TPH was detected in all three rounds, with concentrations up to 33 mg/l. There are no potential human exposures from this media because there have been no exceedances of the CTDEP GWVC and since the groundwater is not a drinking water supply.

Surface Soil - Soil located directly beneath the concrete pad were found to have a PCB concentration of 0.093 mg/kg (2003 MPI CA-725 Revised Report, Attached). Additionally, one composite soil sample indicated PCB and Copper concentrations of 81 mg/kg and 4,600 mg/kg, respectively (2003 MPI CA-725 Revised Report, Attached). Concrete chip samples were collected and the concrete was found to have PCB concentrations up to 32.4 mg/kg (2003 MPI CA-725 Revised Report, Attached). Following characterization activities, the concrete floor was replaced with a new floor. The new floor is inherently free of PCB residues and renders the underlying soil isolated, thus, there are no potential human exposures from this media.

Footnotes:

¹ “Contamination” and “contaminated” describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriately protective risk-based “levels” (for the media, that identify risks within the acceptable risk range).

² Recent evidence (from the Colorado Dept. of Public Health and Environment, and others) suggest that unacceptable indoor air concentrations are more common in structures above groundwater with volatile contaminants than previously believed. This is a rapidly developing field and reviewers are encouraged to look to the latest guidance for the appropriate methods and scale of demonstration necessary to be reasonably certain that indoor air (in structures located above (and adjacent to) groundwater with volatile contaminants) does not present unacceptable risks.

**Current Human Exposures Under Control
Environmental Indicator (EI) RCRIS code (CA725)**

PCB Storage Shed (SWMU #3)

3C. Are there complete pathways between "contamination" and human receptors such that exposures can be reasonably expected under the current (land- and groundwater-use) conditions?

Summary Exposure Pathway Evaluation Table

<u>Contaminated Media</u>	Potential <u>Human Receptors</u> (Under Current Conditions)						
	Residents	Workers	Day-Care	Construction	Trespassers	Recreation	Food
Groundwater	<u>NO</u>	<u>NO</u>	<u>NO</u>	<u>NO</u>	<u>NO</u>	<u>NO</u>	<u>NO</u>
Air (indoors)	<u>--</u>	<u>--</u>	<u>--</u>	<u>--</u>	<u>--</u>	<u>--</u>	<u>--</u>
Soil (surface, e.g., <2 ft)	<u>NO</u>	<u>NO</u>	<u>NO</u>	<u>NO</u>	<u>NO</u>	<u>NO</u>	<u>NO</u>
Surface water	<u>--</u>	<u>--</u>	<u>--</u>	<u>--</u>	<u>--</u>	<u>--</u>	<u>--</u>
Sediment	<u>--</u>	<u>--</u>	<u>--</u>	<u>--</u>	<u>--</u>	<u>--</u>	<u>--</u>
Soil (subsurface e.g., >2 ft)	<u>--</u>	<u>--</u>	<u>--</u>	<u>--</u>	<u>--</u>	<u>--</u>	<u>--</u>
Air (outdoors)	<u>--</u>	<u>--</u>	<u>--</u>	<u>--</u>	<u>--</u>	<u>--</u>	<u>--</u>

Instructions for Summary Exposure Pathway Evaluation Table:

1. Strike-out specific Media including Human Receptors' spaces for Media which are not "contaminated") as identified in #2 above.
2. enter "yes" or "no" for potential "completeness" under each "Contaminated" Media -- Human Receptor combination (Pathway).

Note: In order to focus the evaluation to the most probable combinations some potential "Contaminated" Media - Human Receptor combinations (Pathways) do not have check spaces ("___"). While these combinations may not be probable in most situations they may be possible in some settings and should be added as necessary.

- If no (pathways are not complete for any contaminated media-receptor combination) skip to #6, and enter "YE" status code, after explaining and/or referencing condition(s) in-place, whether natural or man-made, preventing a complete exposure pathway from each contaminated medium (e.g., use optional Pathway Evaluation Work Sheet to analyze major pathways).
- If yes (pathways are complete for any "Contaminated" Media Human Receptor combination) .continue after providing supporting explanation.
- If unknown (for any "Contaminated" Media Human Receptor combination) skip to #6 and enter "IN" status code.

Air (outdoors)	_____	_____	_____	_____

___ If no (for all media) - skip to #6, and enter “YE,” status code after providing or citing appropriate “levels,” and referencing sufficient supporting documentation demonstrating that these “levels” are not exceeded.

X If yes (for any media) continue after identifying key contaminants in each “contaminated” medium, citing appropriate “levels” (or provide an explanation for the determination that the medium could pose an unacceptable risk), and referencing supporting documentation.

___ If unknown (for any media) skip to #6 and enter “IN” status code.

Rationale and Reference(s):

Groundwater – WRM is currently performing annual RCRA groundwater monitoring. Excluding sodium, iron, and manganese, twenty-two water quality standard exceedances were found as part of the 2001 RCRA Monitoring Program Annual Summary Report. The 2001 RCRA Monitoring Program Annual Summary Report found the following contaminants exceeded their respective water quality standards: Chromium (concentrations up to 4,600 ug/l), Cadmium (35 ug/l), Nickel (concentrations up to 190 ug/l), PCE (6.8 ug/l), and TCE (concentrations up to 24 ug/l) (2001 RCRA Monitoring Program Annual Summary Report). Additionally, the following contaminants were either below maximum possible limits or groundwater standards did not exist at the time of analysis: Chloroform, 1,2-Dichloroethene, Vinyl Chloride, Copper, Zinc, Chloride, Sulfate, Sodium, Iron, and Manganese (2001 RCRA Monitoring Program Annual Summary Report). There are no potential exposures from this media because there have been no exceedances of the CTDEP GWVC and since the groundwater is not a drinking water supply.

Subsurface Soil – WRM submitted a Post-Closure Part B Permit Application on December 12, 1991. As part of his application, 71 soil borings were completed around the lagoon, and soil samples were collected up to 12 feet below the ground surface. The data indicated that some soil exceedances of the groundwater ingestion standard using a TCLP analysis for Copper, Lead, Nickel, and Zinc (1991 Part B Application, pg 60). As part of the closure, sludge and contaminated soil were removed and a cap was installed (1999 GZA EI Report, pg 9). Because an impermeable cap has been installed the underlying soils have been rendered inaccessible and thus there are no potential exposures from this media.

Footnotes:

¹ “Contamination” and “contaminated” describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of, appropriately protective risk-based “levels” (for the media, that identify risks within the acceptable risk range).

² Recent evidence (from the Colorado Dept. of Public Health and Environment, and others) suggest that unacceptable indoor air concentrations are more common in structures above groundwater with volatile contaminants than previously believed. This is a rapidly developing field and reviewers are encouraged to look to the latest guidance for the appropriate methods and scale of demonstration necessary to be reasonably certain that indoor air (in structures located above (and adjacent to) groundwater with volatile contaminants) does not present unacceptable risks.

Rationale and Reference(s):

Groundwater - Three rounds of Groundwater sampling have been completed at wells MW-1, MW-4, MW-5, and MP-4 (2003 MPI ESA Phase III) with the following results: Cadmium (diss.) concentrations up to 0.018 mg/l; Cadmium (total) concentrations up to 0.017 mg/l; Copper (diss.) concentrations up to 0.74 mg/l; Copper (total) concentrations up to 0.84 mg/l; Nickel (diss.) concentrations up to 0.42 mg/l; Nickel (total) concentrations up to 0.37 mg/l; Zinc (diss.) concentrations up to 2.2 mg/l; Zinc (total) concentrations up to 2.0 mg/l; cis-1,2 Dichloroethene concentrations up to 3.0 ug/l; TCE concentrations up to 24 ug/l; and TPH concentrations up to 2.2 mg/l. Additionally, the following contaminants were detected in one or two of the three rounds of groundwater sampling: Lead (diss., low-level) (0.005 mg/l); Lead (total, low level) (0.0094 mg/l); and Vinyl Chloride concentrations up to 3.3 ug/L. There are no potential human exposures from this media because while there has been one contaminant (Vinyl Chloride) with exceedances of the CTDEP GWVC (Residential), there have been no exceedances of the Industrial GWVC, there have been no exceedances in down gradient wells, in addition to the fact that this area is approximately 300' from the nearest building.

Surface Soil - All sampling data for this media is discussed in the 2005 MPI CA-725 Revised Report. In one sample copper was found at a concentration of 193,000 mg/kg, which exceeds the CTDEP IDEC for copper of 76,000 mg/kg. TCE concentrations were found up to 36 ug/kg. TPH concentrations were found up to 930 mg/kg (2001 MPI CA 725, Table 1). The toluene concentration in one sample was 29 ug/kg (2001 MPI CA 725, Table 1). Investigations of this area show that no sample data indicate exceedances of CTDEP GBPMC, or any Appendix IX parameters.

Subsurface Soil - Malcolm Pirnie collected nine samples during August 2001. All sampling data for this media is discussed in the 2005 MPI CA-725 Revised Report. Copper concentrations were found up to 4,550 mg/kg. Naphthalene concentrations were found in one sample to be 39,000 ug/kg. TCE concentrations were found up to 43 ug/kg. TPH concentrations were found up to 870 mg/kg. Investigations of this area show that no sample data indicate exceedances of CTDEP IDEC or CTDEP GBPMC, or any Appendix IX parameters. Consequently, there are no potential human exposures from this media.

Footnotes:

¹ “Contamination” and “contaminated” describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriately protective risk-based “levels” (for the media, that identify risks within the acceptable risk range).

Rationale and Reference(s):

Groundwater - Three rounds of Groundwater sampling have been completed at wells HA-2MW and HA-4MW (2003 MPI ESA Phase III) with the following results: Copper (diss.) concentrations up to 0.22 mg/l; Copper (total) concentrations up to 0.22 mg/l; Nickel (diss.) concentrations up to 0.048 mg/l; Nickel (total) concentrations up to 0.048 mg/l; Zinc (diss.) concentrations up to 0.36 mg/l; Zinc (total) concentrations up to 0.36 mg/l. Additionally, the following contaminants were also detected in all three rounds of groundwater sampling: Chloroform concentrations up to 18 ug/l; Isopropylbenzene concentrations up to 5.0 ug/l; Ethylene Chloride concentrations up to 1.8 ug/l; Naphthalene concentrations up to 4.5 ug/l; n-Propylbenzene concentrations up to 2.4 ug/l; sec-Butylbenzene concentrations up 3.7 ug/l; tert-Butylbenzene concentrations up to 1.3 ug/l; and TPH concentrations up to 5.0 ug/l. Finally, the following contaminants were detected in one or two of the three rounds of groundwater sampling: Cadmium (total) (0.0072 mg/l; 1,2,4 Trimethylbenzene concentrations up to 0.79 ug/l; 1,3,5 Trimethylbenzene concentrations up to 1.1 ug/l; and n-Butylbenzene concentrations up to 0.85 ug/l. There are no potential human exposures from this media because there have been no exceedances of the CTDEP GWVC and since the groundwater is not a drinking water supply.

Surface Soil - In December 1999 two borings were drilled in the area of two USTs shown on the 1934 insurance map (1999 GZA EI Report, pg 13) as part of a Phase II Environmental Site Assessment (2000 MPI ESA Phase II). One sample from 0-2 feet below ground surface was analyzed for total RCRA metals. While Beryllium, Cadmium, Chromium, Copper, Lead, and Zinc were detected, no concentrations were detected above RDEC. There are no potential human exposures from this media because the contaminated soil is located under pavement and therefore isolated from any human exposure.

Subsurface Soil - TPH, Ethylbenzene, Toluene, Xylene, and Lead have been detected in samples at depths greater than 4' below grade (2000 MPI ESA Phase II). Because any contamination is located at depths greater than 4' below grade, the contamination is rendered inaccessible, and thus there are no potential human exposures for this media.

Footnotes:

¹ “Contamination” and “contaminated” describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriately protective risk-based “levels” (for the media, that identify risks within the acceptable risk range).

2. enter “yes” or “no” for potential “completeness” under each “Contaminated” Media -- Human Receptor combination (Pathway).

Note: In order to focus the evaluation to the most probable combinations some potential “Contaminated” Media - Human Receptor combinations (Pathways) do not have check spaces (“___”). While these combinations may not be probable in most situations they may be possible in some settings and should be added as necessary.

 X If no (pathways are not complete for any contaminated media-receptor combination) skip to #6, and enter “YE” status code, after explaining and/or referencing condition(s) in-place, whether natural or man-made, preventing a complete exposure pathway from each contaminated medium (e.g., use optional Pathway Evaluation Work Sheet to analyze major pathways).

 If yes (pathways are complete for any “Contaminated” Media Human Receptor combination) continue after providing supporting explanation.

 If unknown (for any “Contaminated” Media Human Receptor combination) skip to #6 and enter “IN” status code.

**Current Human Exposures Under Control
Environmental Indicator (EI) RCRIS code (CA725)**

Former Tanks by Accounting Office Area (AOC #3)

6F. Check the appropriate RCRIS status codes for the Current Human Exposures Under Control EI event code (CA725), and obtain Supervisor (or appropriate Manager) signature and date on the EI determination below (and attach appropriate supporting documentation as well as a map of the facility):

YE - Yes, "Current Human Exposures Under Control" has been verified. Based on a review of the information contained in this EI Determination, "Current Human Exposures" are expected to be "Under Control" at the Waterbury Rolling Mills, Inc. facility, EPA ID # CT D001164607 located at 240 Aurora Street, Waterbury, Connecticut under current and reasonably expected conditions. This determination will be re-evaluated when the Agency/State becomes aware of significant changes at the facility.

NO - "Current Human Exposures" are NOT "Under Control."

IN - More information is needed to make a determination.

Air (outdoors)	_____	_____	_____	_____

_____ If no (for all media) - skip to #6, and enter "YE," status code after providing or citing appropriate "levels," and referencing sufficient supporting documentation demonstrating that these "levels" are not exceeded.

X If yes (for any media) continue after identifying key contaminants in each "contaminated" medium, citing appropriate "levels" (or provide an explanation for the determination that the medium could pose an unacceptable risk), and referencing supporting documentation.

_____ If unknown (for any media) skip to #6 and enter "IN" status code.

Rationale and Reference(s):

Groundwater - Three rounds of Groundwater sampling have been completed at wells MP-1, HA-1MW, and HA-3MW (2003 MPI ESA Phase III) with the following results: Cadmium (diss.) concentrations up to 0.036 mg/l; Cadmium (total) concentrations up to 0.033 mg/l; Copper (diss.) concentrations up to 2.2 mg/l; Copper (total) concentrations up to 2.4 mg/l; Zinc (diss.) concentrations up to 8.1 mg/l; Zinc (total) concentrations up to 7.4 mg/l. Additionally, the following contaminants were also detected in all three rounds of groundwater sampling: 1,1 Dichloroethane concentrations up to 3.0 ug/l; cis-1,2 Dichloroethene concentrations up to 23 ug/l; 1,2,4 Trimethylbenzene concentrations up to 54 ug/l; 1,3,5 Trimethylbenzene concentrations up to 15 ug/l; Acetone concentrations up to 30 ug/l; Benzene concentrations up to 4.1 ug/l; Ethylbenzene concentrations up to 11 ug/l; Isopropylbenzene concentrations up to 11 mg/l; m/p Xylene concentrations up to 17 ug/l; MTBE concentrations up to 2.2 ug/l; Naphthalene concentrations up to 110 ug/l; n-Butylbenzene concentrations up to 2.7 ug/l; n-Propylbenzene concentrations up to 11 ug/l; o-Xylene concentrations up to 7.6 ug/l; p-Isopropyltoluene concentrations up to 3.9 ug/l; sec-Butylbenzene concentrations up to 5.4 ug/l; tert-Butylbenzene concentrations up to 1.6 ug/l; In the deep well MP-13, near HA3-MW, TCE concentrations of up to 120 ug/l were detected; and TPH concentrations as detected in all three rounds, with concentrations up to 28 mg/l. Finally, the following contaminants were detected in one or two of the three rounds of groundwater sampling: 2-Butanone concentrations up to 7.4 ug/l; PCE concentrations up to 2.7 ug/l; and 1,1 Dichloroethene was detected at 0.55 ug/l.

Subsurface Soil - TPH was found to be in concentrations as high as 13,827 mg/kg (2000 MPI ESA Phase II). Since the TPH was found to be at a depth greater than 4' below grade, it can be rendered inaccessible and therefore there are no potential human exposures from this media.

Footnotes:

¹ “Contamination” and “contaminated” describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriately protective risk-based “levels” (for the media, that identify risks within the acceptable risk range).

² Recent evidence (from the Colorado Dept. of Public Health and Environment, and others) suggest that unacceptable indoor air concentrations are more common in structures above groundwater with volatile contaminants than previously believed. This is a rapidly developing field and reviewers are encouraged to look to the latest guidance for the appropriate methods and scale of demonstration necessary to be reasonably certain that indoor air (in structures located above (and adjacent to) groundwater with volatile contaminants) does not present unacceptable risks.

**Current Human Exposures Under Control

Instructions for Summary Exposure Pathway Evaluation Table:

1. Strike-out specific Media including Human Receptors' spaces for Media which are not "contaminated") as identified in #2 above.
2. enter "yes" or "no" for potential "completeness" under each "Contaminated" Media -- Human Receptor combination (Pathway).

Note: In order to focus the evaluation to the most probable combinations some potential "Contaminated" Media - Human Receptor combinations (Pathways) do not have check spaces ("___"). While these combinations may not be probable in most situations they may be possible in some settings and should be added as necessary.

- X If no (pathways are not complete for any contaminated media-receptor combination) skip to #6, and enter "YE" status code, after explaining and/or referencing condition(s) in-place, whether natural or man-made, preventing a complete exposure pathway from each contaminated medium (e.g., use optional Pathway Evaluation Work Sheet to analyze major pathways).
- If yes (pathways are complete for any "Contaminated" Media Human Receptor combination) continue after providing supporting explanation.
- If unknown (for any "Contaminated" Media Human Receptor combination) skip to #6 and enter "IN" status code.

While TCE was found at concentrations exceeding the CTDEP IGWVC (Industrial of 67 ug/l), it was found only at a deep well (MP-13) screened from 88' to 98' below grade. The concentration is believed to be attributed to a regional groundwater condition. Since these were the only TCE exceedances of the CTDEP IGWVC, and the groundwater is not a drinking water supply, there are no potential human exposures from this compound. There is no likelihood of off-site non-industrial exposures of TCE concentrations because there are no residences, schools, libraries, hospitals, hotels or stores hydraulically downgradient of the deep wells prior to the groundwater discharge to the Naugatuck River which is present approximately 1500 feet to the south. There is only one building between well MP-13 and the Naugatuck River at 237 East Aurora Street. It must be noted that there appear to be no complete pathways of exposure of the TCE to overlying structures as all shallow wells near well MP-13 have no detections of TCE.

Environmental Indicator (EI) RCRIS code (CA725)

Former Tanks Near Maintenance Area (AOC #4)

6G. Check the appropriate RCRIS status codes for the Current Human Exposures Under Control EI event code (CA725), and obtain Supervisor (or appropriate Manager) signature and date on the EI determination below (and attach appropriate supporting documentation as well as a map of the facility):

YE - Yes, "Current Human Exposures Under Control" has been verified. ___ If unknown (for any media) skip to #6 and enter "IN" status code.

Rationale and Reference(s):

Groundwater - Three rounds of Groundwater sampling have been completed at wells MP-3, MW-3, MP-6, and MP-14 (2003 MPI ESA Phase III) with the following results: Cadmium (diss.) concentrations up to 0.038 mg/l; Cadmium (total) concentrations up to 0.034 mg/l; Copper (total) concentrations up to 0.065 mg/l; Zinc (diss.) concentrations up to 0.18 mg/l; Zinc (total) concentrations up to 0.18 mg/l. Additionally, the following contaminants were also detected in all three rounds of groundwater sampling: 1,1 Dichloroethane concentrations up to 2.3 ug/l; 1,2,4 Trimethylbenzene concentrations up to 240 ug/l; 1,3,5 Trimethylbenzene concentrations up to 68 ug/l; Benzene concentrations up to 0.87 ug/l; Ethylbenzene concentrations up to 71 ug/l; Isopropylbenzene concentrations up to 15 mg/l; m/p Xylene concentrations up to 180 ug/l; Naphthalene concentrations up to 390 ug/l; n-Butylbenzene concentrations up to 8.3 ug/l; n-Propylbenzene concentrations up to 24 ug/l; o-Xylene concentrations up to 13 ug/l; p-Isopropyltoluene concentrations up to 3.8 ug/l; sec-Butylbenzene concentrations up to 5.3 ug/l; tert-Butylbenzene concentrations up to 1.5 ug/l; Toluene concentrations up to 2.4 ug/l; TCE concentrations up to 3.7 ug/l.; and TPH concentrations as detected in all three rounds, with concentrations up to 160 mg/l. Finally, the following contaminants were found in one or two of the three rounds of groundwater sampling: Copper (diss) concentrations up to 0.031 mg/l; 1,1 Trichloroethane concentrations up to 0.79 ug/l; chloroform (0.64 ug/l); and Acetone (26 ug/l). Well MP-40 was installed approximately 50 feet south of the former tank area and sampled in April 2005. All VOCs detected were at concentrations below applicable volatilization criteria. There are no potential human exposures from this media because there have been no exceedances of the CTDEP GWVC and since the groundwater is not a drinking water supply.

Surface Soil - TPH was found to be in concentrations as high as 5,742 mg/kg (2000 MPI ESA Phase II). There are no potential exposures from this media because the contaminated soil is located under pavement and therefore isolated from any human exposure.

Subsurface Soil - TPH was found to be in concentrations as high as 47,450 mg/kg (2000 MPI ESA Phase II) in

boring B-06A (9-11'). Groundwater near this boring was measured at 11.8 feet at this time and is higher in elevation in the spring months. The elevated TPH is associated with the smear zone created by the groundwater table fluctuation. Xylene was found in one sample with a concentration of 19 mg/kg. There are no potential exposures from this media because the TPH is believed to be associated with the "smear zone" from LNAPL on the groundwater. Because the TPH was found at and below the seasonal high groundwater level, PMC does not apply. Additionally, groundwater is not used as a source of drinking water. Since the TPH was found to be at a depth greater than 4' below grade, it can be rendered inaccessible and therefore there are no potential human exposures from this media.

Footnotes:

¹ "Contamination" and "contaminated" describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriately protective risk-based "levels" (for the media, that identify risks within the acceptable risk range).

Instructions for Summary Exposure Pathway Evaluation Table:

1. Strike-out specific Media including Human Receptors' spaces for Media which are not "contaminated") as identified in #2 above.
2. enter "yes" or "no" for potential "completeness" under each "Contaminated" Media -- Human Receptor combination (Pathway).

Note: In order to focus the evaluation to the most probable combinations some potential "Contaminated" Media - Human Receptor combinations (Pathways) do not have check spaces ("___"). While these combinations may not be probable in most situations they may be possible in some settings and should be added as necessary.

- X If no (pathways are not complete for any contaminated media-receptor combination) skip to #6, and enter "YE" status code, after explaining and/or referencing condition(s) in-place, whether natural or man-made, preventing a complete exposure pathway from each contaminated medium (e.g., use optional Pathway Evaluation Work Sheet to analyze major pathways).
- If yes (pathways are complete for any "Contaminated" Media .Human Receptor combination) .continue after providing supporting explanation.
- If unknown (for any "Contaminated" Media .Human Receptor combination) .skip to #6 and enter "IN" status code.

While TCE was found at concentrations in exceedance of the CTDEP GWVC (Industrial), it was found only at a deep well, and is believed to be attributed to a regional groundwater condition. Since this was the only exceedances of the CTDEP GWVC, and the groundwater is not a drinking water supply, there are no potential human exposures from this media. There is no likelihood of off-site non-industrial exposures of TCE concentrations because there are no residences, schools, libraries, hospitals, hotels or stores hydraulically downgradient of the deep wells prior to the presumed groundwater discharge to the Naugatuck River which is present to the south. There is only one building,

located at 237 East Aurora Street, between well MP-13 and the Naugatuck River. It must be noted that there appear to be no complete pathways of exposure of the TCE to overlying structures as all shallow wells near well MP-13 and AOC #13a have no detections of TCE. Furthermore, the indoor air monitoring program performed at WRM complied with OSHA standards.

**Current Human Exposures Under Control
Environmental Indicator (EI) RCRIS code (CA725)**

Former 4,000 Gallon Diesel/Gasoline Tank
AOC #13b
Release Summary

**Current Human Exposures Under Control
Environmental Indicator (EI) RCRIS code (CA725)**

Former 4,000 gallon Diesel/Gasoline Tank (AOC #13b)

2J. Are groundwater, soil, surface water, sediments, or air **media** known or reasonably suspected to be "contaminated" above appropriately protective risk-based "levels" (applicable promulgated standards, as well as other appropriate standards, guidelines, guidance, or criteria) from releases subject to RCRA Corrective Action (from SWMUs, RUs or AOCs)?

	YES	No	?	Rationale / Key Contaminants
Groundwater	X			Cadmium, Copper, Zinc, 1,1 Trichloroethane, 1,1 Dichloroethane, 1,2,4 Trimethylbenzene, 1,3,5 Trimethylbenzene, Acetone, Benzene, Chloroform, Ethylbenzene, Isopropylbenzene, Xylene, Naphthalene, Butylbenzene, Isopropyltoluene, Toluene, TCE, and TPH.
Air (indoors) ²	_____	_____	_____	_____
Surface Soil (e.g., <2 ft)	_____	_____	_____	_____
Surface Water	_____	_____	_____	_____
Sediment	_____	_____	_____	_____
Subsurf. Soil (e.g., >2 ft)	X			Lead, Trimethylbenzene, Butanone, 4-Methyl-2-Pentanone, Ethylbenzene, Isopropylbenzene, Xylene, Naphthalene, Butylbenzene, and Isopropyltoluene.
Air (outdoors)	_____	_____	_____	_____

_____ If no (for all media) - skip to #6, and enter "YE," status code after providing or citing appropriate "levels," and referencing sufficient supporting documentation demonstrating that these "levels" are not exceeded.

X If yes (for any media) continue after identifying key contaminants in each "contaminated" medium, citing appropriate "levels" (or provide an explanation for the determination that the medium could pose an unacceptable risk), and referencing supporting documentation.

_____ If unknown (for any media) skip to #6 and enter "IN" status code.

Rationale and Reference(s):

Groundwater - Three rounds of Groundwater sampling have been completed at wells MP-3, MW-3, MP-6, and MP-14 (2003 MPI ESA Phase III) with the following results: Cadmium (diss.) concentrations up to 0.038 mg/l; Cadmium (total) concentrations up to 0.034 mg/l; Copper (total) concentrations up to 0.065 mg/l; Zinc (diss.) concentrations up to 0.18 mg/l; Zinc (total) concentrations up to 0.18 mg/l. Additionally, the following contaminants were also detected in all three rounds of groundwater sampling: 1,1 Dichloroethane concentrations up to 2.3 ug/l; 1,2,4 Trimethylbenzene concentrations up to 240 ug/l; 1,3,5 Trimethylbenzene concentrations up to 68 ug/l; Benzene concentrations up to 0.87 ug/l; Ethylbenzene concentrations up to 71 ug/l; Isopropylbenzene concentrations up to 15 mg/l; m/p Xylene concentrations up to 180 ug/l; Naphthalene concentrations up to 390 ug/l; n-Butylbenzene concentrations up to 8.3 ug/l; n-Propylbenzene concentrations up to 24 ug/l; o-Xylene concentrations up to 13 ug/l; p-Isopropyltoluene concentrations up to 3.8 ug/l; sec-Butylbenzene concentrations up to 5.3 ug/l; tert-Butylbenzene concentrations up to 1.5 ug/l; Toluene concentrations up to 2.4 ug/l; TCE concentrations up to 3.7 ug/l; and TPH concentrations as detected in all three rounds, with concentrations up to 160 mg/l. Finally, the following contaminants were found in one or two of the three of the rounds of groundwater sampling: Copper (diss) concentrations up to 0.031 mg/l; 1,1 Trichloroethane concentrations up to 0.79 ug/l; chloroform (0.64 ug/l); and Acetone (26 ug/l). There are no potential human exposures from this media because there have been no exceedances of the CTDEP GWVC and since the groundwater is not a drinking water supply.

Subsurface Soil - TPH was found to be in concentrations as high as 53,000 mg/kg (2000 MPI ESA Phase II). Additional soil samples were collected and analyzed during September 2002 with the following results (2003 MPI ESA Phase III): Lead concentrations up to 6.1 mg/kg; 1,2,4 Trimethylbenzene concentrations up to 32,000 ug/kg; 1,3,5 Trimethylbenzene concentrations up to 13,000 ug/kg; 2-Butanone concentrations up to 210 ug/kg; 4-Methyl-2-

Pentanone; Ethylbenzene concentrations up to 4,800 ug/kg; Isopropylbenzene concentrations up to 4,200 ug/kg; m/p Xylene concentrations up to 15,000 ug/kg; Naphthalene 37,000 ug/kg; n-Butylbenzene 13,000 ug/kg; n-Propylbenzene concentrations up to 9,500 ug/kg; p-Isopropyltoluene concentrations up to 8,700 ug/kg; and sec-Butylbenzene concentrations up to 6,000 ug/kg. Since the TPH and VOCs were found to be at a depth greater than 4' below grade, the contamination can be rendered inaccessible and therefore there are no potential human exposures from this media.

Footnotes:

¹ “Contamination” and “contaminated” describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriately protective risk-based “levels” (for the media, that identify risks within the acceptable risk range).

² Recent evidence (from the Colorado Dept. of Public Health and Environment, and others) suggest that unacceptable indoor air concentrations are more common in structures above groundwater with volatile contaminants than previously believed. This is a rapidly developing field and reviewers are encouraged to look to the latest guidance for the appropriate methods and scale of demonstration necessary to be reasonably certain that indoor air (in structures located above (and adjacent to) groundwater with volatile contaminants) does not present unacceptable risks.

**Current Human Exposures Under Control
Environmental Indicator (EI) RCRIS code (CA725)**

Former 4,000 gallon Diesel/Gasoline Tank (AOC #13b)

3J. Are there **complete pathways** between “contamination” and human receptors such that exposures can be reasonably expected under the current (land- and groundwater-use) conditions?

Summary Exposure Pathway Evaluation Table

Instructions for Summary Exposure Pathway Evaluation Table:

1. Strike-out specific Media including Human Receptors' spaces for Media which are not “contaminated”) as identified in #2 above.
2. enter “yes” or “no” for potential “completeness” under each “Contaminated” Media -- Human Receptor combination (Pathway).

Note: In order to focus the evaluation to the most probable combinations some potential “Contaminated” Media - Human Receptor combinations (Pathways) do not have check spaces (“___”). While these combinations may not be probable in most situations they may be possible in some settings and should be added as necessary.

- X If no (pathways are not complete for any contaminated media-receptor combination) skip to #6, and enter “YE” status code, after explaining and/or referencing condition(s) in-place, whether natural or man-made, preventing a complete exposure pathway from each contaminated medium (e.g., use optional Pathway Evaluation Work Sheet to analyze major pathways).
- If yes (pathways are complete for any “Contaminated” Media Human Receptor combination) continue after providing supporting explanation.
- If unknown (for any “Contaminated” Media Human Receptor combination) skip to #6 and enter “IN” status code.

**Current Human Exposures Under Control
Environmental Indicator (EI) RCRIS code (CA725)**

Former 4,000 gallon Diesel/Gasoline Tank (AOC #13b)

6J. Check the appropriate RCRIS status codes for the Current Human Exposures Under Control EI event code (CA725), and obtain Supervisor (or appropriate Manager) signature and date on the EI determination below (and attach appropriate supporting documentation as well as a map of the facility):

YE - Yes, "Current Human Exposures Under Control" has been verified. Based on a review of the information contained in this EI Determination, "Current Human Exposures" are expected to be "Under Control" at the Waterbury Rolling Mills, Inc. facility, EPA ID # CT D001164607 located at 240 Aurora Street, Waterbury, Connecticut under current and reasonably expected conditions. This determination will be re-evaluated when the Agency/State becomes aware of significant changes at the facility.

NO - "Current Human Exposures" are NOT "Under Control."

IN - More information is needed to make a determination.

X If yes (for any media) continue after identifying key contaminants in each “contaminated” medium, citing appropriate “levels” (or provide an explanation for the determination that the medium could pose an unacceptable risk), and referencing supporting documentation.

_____ If unknown (for any media) skip to #6 and enter “IN” status code.

Rationale and Reference(s):

Surface Soil - In October 1993, a leak of Pickling Fluid occurred due to a clogged drain pipe and the fluid overflowed to a nearby defunct roof drain that discharged to Steele Brook. Some of the liquid was suspected to leak around the drain to the underlying soil. The discharge contained approximately 100 gallons and consisted of approx. 2 lbs sulfuric acid, 0.15 lbs of hydrogen peroxide and approx. 0.3 lbs of copper in solution. Upon decommissioning of the #402 and #403 pickle lines in October of 1998 (that were juxtaposed each other) composite soil samples were collected from under each pickle line and the results for SPLP metals (silver, arsenic, barium, cadmium, chromium, copper, mercury, lead and selenium) were all below detection limits.

Surface Water - In February 1993 and October 1993, leaks of Pickling Fluid occurred which resulted in the release of the fluid to the Steele Brook via the drainage system (Addendum to November 5, 2001 Response to Draft EPA Comments). The Pickling Lines were then decommissioned in 1998 (Addendum to November 5, 2001 Response to Draft EPA Comments), thus there are no potential human exposures from this media.

Sediment - Because the major constituents of the Pickling Fluid are soluble in water, any releases into Steele Brook would have likely flowed downstream and not been entrapped in sediments. Furthermore, due to the transient nature of sediment in a stream, where it is mobilized following major storm events, sediments in the area of the release in 1993 have likely been washed far downstream. Therefore, there are no potential human exposures from this media.

Footnotes:

¹ “Contamination” and “contaminated” describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriately protective risk-based “levels” (for the media, that identify risks within the acceptable risk range).

A. The Pickling Lines were decommissioned in 1998 and soil samples confirmed that soil beneath the lines did not exceed RSR criteria, i.e. GBPMC for metals of concern. It is our opinion that there are no potential human exposures from this media. Upon decommissioning it was noted that a new 8" thick concrete pad was installed in the area of the pickling lines. The results of the soil samples are included at the rear of Appendix D.

Surface Water			NA	
Sediment			NA	
Subsurf. Soil (e.g., >2 ft)			NA	
Air (outdoors)			NA	

NA= Non Applicable (offsite)

If no (for all media) - skip to #6, and enter "YE," status code after providing or citing appropriate "levels," and referencing sufficient supporting documentation demonstrating that these "levels" are not exceeded.

If yes (for any media) continue after identifying key contaminants in each "contaminated" medium, citing appropriate "levels" (or provide an explanation for the determination that the medium could pose an unacceptable risk), and referencing supporting documentation.

If unknown (for any media) skip to #6 and enter "IN" status code.

Rationale and Reference(s):

The complete write-up for Groundwater migration off-site is contained in Section 7 of "Human Exposures Assessment for Environmental Indicators CA-725 (revised)", included in this document. In brief, the potential for Human Exposures due to offsite groundwater migration toward any hydraulically down-gradient areas is limited to volatile organic compounds in groundwater beneath buildings. The hydraulically downgradient border of the WRM property is also roughly 350 feet from the building located at 237 East Aurora Street. Volatile organic compounds in groundwater were not detected at the downgradient boundary of the WRM site at concentrations exceeding volatilization criteria. Volatile organic compounds were also not detected in groundwater samples at concentrations that exceeded residential groundwater volatilization criteria collected from wells along the northern border of the site at 237 East Aurora Street. Results from the recent sampling of these wells are provided in Table 6 and well locations are shown on Figure 6. No non-industrial receptors exist in the area of the observed LNAPL in the area between the south end of the WRM property and the Naugatuck River or Steele Brook. This includes, but is not limited to schools, libraries, hospitals, hotels or stores.

Footnotes:

¹ "Contamination" and "contaminated" describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriately protective risk-based "levels" (for the media, that identify risks within the acceptable risk range).

Rationale and Reference(s): (Reference numbers correspond to the numbers provided in Appendix A of the Human Exposures Assessment for Environmental Indicators CA-725 (revised).)

Griset Mill Satellite Storage (SWMU #4): Reference 4, (p. 7). There are no records of spills or releases to this area since the Griset Mill was installed in 1986. We concur that human exposures are controlled under current site conditions.

Wastewater treatment system / discharge (SWMU #5/ NCAPS #5): References 4 (p. 8), 12 (p. 4). The conditions described previously remain current, i.e. there are no records of spills or releases, waste water is discharged under permit to the local POTW, and risk of human exposures at this area are limited to trained personnel during the course of waste water treatment operations.

Primary waste storage area (SWMU #6): Reference 4 (p. 8). The conditions described remain current, i.e. 1995 construction of coated concrete floor and berm inside the site building, no reported spills or releases from this area, the area is inspected weekly, and human exposures are controlled under current site conditions.

Secondary waste storage area (SWMU #7): Reference 4 (p. 8). The conditions described remain current, i.e. area is located on a concrete floor with berm inside the site building, no reported spills or releases from this area, the area is inspected weekly, and human exposures are controlled under current site conditions.

Exhaust condensate collection system from annealing furnaces (SWMU #9): Reference 4 (p. 9). The conditions described remain current, i.e. containment is excellent, no releases have reportedly occurred, and human exposures are controlled under current site conditions.

Metal hydroxide sludge roll off (SWMU #10): Reference 4 (p. 10). The conditions described remain current, i.e. the roll off is lined, is located on an asphalt and concrete pad, is covered except when being filled, and subject to monthly formal inspections. No releases have been reported and human exposures are controlled for this unit.

Current Human Exposures Under Control
Environmental Indicator (EI) RCRIS code (CA725)

Page 3

Scrap concrete/firebrick and metal roll off (SWMU #11): Reference 4 (p. 10). The conditions described remain current, i.e. the two roll offs are on concrete pads, covered with a roof, inspected daily, and human exposures are controlled under current site conditions.

Oily sweeps roll off (SWMU #12): Reference 4 (p. 10). The conditions described remain current, i.e. the area is roofed, paved, inspected regularly, and no releases have been reported from this unit. Therefore, human exposures are controlled under current site conditions.

Former hazardous waste storage area (SWMU #14/ NCAPS #2): References 4 (p. 11), 12 (p. 3). We concur with the findings that there are no records of spills or releases to this area, containment was "good", the area underwent RCRA generator closure before being converted to a loading dock including the pouring of a new floor/ramp system, and there is no known threat for human exposures.

Former waste oil AST (550 gallon) (SWMU #15/ NCAPS #8): References 4 (p. 12), 12 (p. 6). The conditions described remain current, i.e. there are no records of spills or releases from the tank, the tank was stored on paved surfaces, and there is no known threat for human exposure as use of the tank was discontinued in 1989.

Former Sulfuric Acid storage (AOC #1): Reference 4 (p. 12). The conditions described remain current, i.e. the original AST was removed and sulfuric acid is currently stored in a tote with secondary containment. No releases have been reported from either container. We concur that human exposures are controlled under current site use.

Sulfuric acid spill area (AOC #2): Reference 4 (p. 12). The conditions described remain current, i.e. one acid release was reported in 1994. The spill was cleaned up, an evaluation determined that the spilled acid did not penetrate the floor, and a new concrete floor was laid over the existing floor. Therefore, there is no known threat for human exposures under current site use.

Parts washers (4) (AOC #5): Reference 4 (p. 14). The conditions described remain current, i.e. the facility currently uses non-hazardous materials in self-contained parts washers. No releases have been reported from any container when hazardous compounds were present. Because these areas are located inside on concrete floors with no floor drains, human exposures are controlled under current site conditions.

Virgin oil storage (grinding shop) (AOC #6): Reference 4 (p. 14). The conditions described remain current, i.e. no releases have been reported, the area has a concrete floor with no floor drains, and human exposures are controlled under current site conditions.

Virgin oil storage (production bldg.) (AOC #7): Reference 4 (p. 14). The conditions described remain current, i.e. no releases have been reported, the area is located indoors on a concrete floor with no floor drains, it is routinely inspected, and human exposures are believed to be controlled under current site conditions.

Above ground storage tank (AST) in office building (AOC #8): Reference 4 (p. 15), Reference 13 (p. 2-7). The conditions described remain current, i.e. no releases have been reported, the new tank installed October 2001 is double walled with a leak detection system and is located indoors on a concrete floor with no floor drains, and human exposures are controlled under current site conditions.

Diesel AST for 400kw emergency generator outside baghouse area (AOC #9): Reference 4 (p. 15). The conditions described remain current, i.e. no releases have been reported, the tank has a leak monitoring system and secondary containment, is protected by bollards, and is inspected every time it is filled. Human exposures are controlled under current site conditions.

No. 2 fuel oil AST for boiler (AOC #10): Reference 4 (p. 15). The conditions described remain current, i.e. no releases have been reported, the tank has a leak monitoring system and secondary containment, is protected by a concrete wall, and is inspected every time it is filled. Human exposures are controlled under

**Current Human Exposures Under Control
Environmental Indicator (EI) RCRIS code (CA725)**

Page 4

current site conditions.

Transformers (AOC #12): Reference 4 (p. 16), Reference 13 (p. 2-7). The conditions described remain current, i.e. three transformers have been taken out of commission and replaced with two transformers. One is a dry transformer and the other is a non-PCB oil filled transformer. All are mounted on a fenced concrete pad. Aside from minor stains observed in 1996, no releases have been reported. Human exposures are controlled under current site conditions

Former Waste Oil Storage Tank (7,500 gallon) (NCAPS #3): Reference 12 (p. 3). The conditions described remain current, i.e. precise location uncertain, the yard soils are currently paved and inaccessible, and there is no threat for human exposure. Additional information is not available.

Furnaces (NCAPS #7): Reference 3 (p. 5). The conditions described remain current, i.e. containment is good, and there is no known threat for human exposure.

Rolling Mills (NCAPS #9): Reference 12 (p. 6). The conditions described remain current, i.e. containment is very good and potential human exposure is limited to manufacturing personnel in the workplace environment. Also, there are no records of spills or releases from this area.

Slitting Rooms (NCAPS #10): Reference 12 (p. 6). The conditions described remain current, i.e. containment is very good and potential human exposure is limited to manufacturing personnel in the workplace environment. Also, there are no records of spills or releases from this area.

Furnace Oil Spill Area (Stain) (NCAPS #11): Reference 12 (p.7). The conditions described remain current, no stained area was found upon inspection, and underlying soil is currently inaccessible and not a threat for human exposure.

Machine Shop (NCAPS #12): Reference 12 (p.7). The conditions described remain current, i.e. containment is very good, the area has been decommissioned, and there is no known threat for human exposure.

Footnotes:

¹ "Contamination" and "contaminated" describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriately protective risk-based "levels" (for the media, that identify risks within the acceptable risk range).

² Recent evidence (from the Colorado Dept. of Public Health and Environment, and others) suggest that unacceptable indoor air concentrations are more common in structures above groundwater with volatile contaminants than previously believed. This is a rapidly developing field and reviewers are encouraged to look to the latest guidance for the appropriate methods and scale of demonstration necessary to be reasonably certain that indoor air (in structures located above (and adjacent to) groundwater with volatile contaminants) does not present unacceptable risks.

6. Check the appropriate RCRIS status codes for the Current Human Exposures Under Control EI event code (CA725), and obtain Supervisor (or appropriate Manager) signature and date on the EI determination below (and attach appropriate supporting documentation as well as a map of the facility):

YE - Yes, "Current Human Exposures Under Control" has been verified. Based on a review of the information contained in this EI Determination, "Current Human Exposures" are expected to be "Under Control" at the Waterbury Rolling Mills, Inc. facility, EPA ID # CT D001164607 located at 240 Aurora Street, Waterbury, Connecticut under current and reasonably expected conditions. This determination will be re-evaluated when the Agency/State becomes aware of significant changes at the facility.

NO - "Current Human Exposures" are NOT "Under Control."

IN - More information is needed to make a determination.

Solid Waste Management Units						
1	Former outside drum storage area	Yes		X	No	Go To SWMU ITEM # 1 Table 5
2	Baghouse storage area	No				No VOC concerns per this ITEM #
3	PCB storage shed	No				No VOC concerns per this ITEM #
4	Griset mill satellite storage	No				No VOC concerns per this ITEM #
5	Wastewater treatment system/discharge	No				No VOC concerns per this ITEM #
6	Primary waste storage area	No				No VOC concerns per this ITEM #
7	Secondary waste storage area	No				No VOC concerns per this ITEM #
8	Former surface impoundment area	No				No VOC concerns per this ITEM #
9	Exhaust condensate collection system from annealing furnaces	No				No VOC concerns per this ITEM #
10	Metal hydroxide sludge roll off	No				No VOC concerns per this ITEM #
11	Scrap concrete/firebrick and metal roll off	No				No VOC concerns per this ITEM #
12	Oily sweeps roll off	No				No VOC concerns per this ITEM #
13	Historic landfill area	No				No VOC concerns per this ITEM #
14	Former hazardous waste storage area	No				No VOC concerns per this ITEM #
15	Former waste oil AST	No				No VOC concerns per this ITEM #

Areas of Concern

1	Former sulfuric acid storage	No				No VOC concerns per this ITEM #
2	Sulfuric acid spill area	No				No VOC concerns per this ITEM #
3	Former tanks by accounting office building	Yes (gasoline tank only)		X	Yes	Go To AOC ITEM # 3 Table 5
4	Former tanks near maintenance area	No				No VOC concerns per this ITEM #
5	Parts washers (4)	Yes		X	No	Go To AOC ITEM #5 Table 5
6	Virgin oil storage (grinding shop)	No				No VOC concerns per this ITEM #
7	Virgin oil storage (production bldg.)	No				No VOC concerns per this ITEM #
8	Above ground storage tank (AST) in office building	No				No VOC concerns per this ITEM #
9	Diesel AST for 400kw emergency generator outside baghouse area	No				No VOC concerns per this ITEM #
10	No. 2 fuel oil AST for boiler	No				No VOC concerns per this ITEM #
11	Four former tanks near railroad tracks	No				No VOC concerns per this ITEM #
12	Transformers	No				No VOC concerns per this ITEM #
13a	Fuel oil underground storage tank (F8, not found)	No				No VOC concerns per this ITEM #
13b	Former 4,000 gallon diesel/gasoline tank	Yes		X	Yes	Go to AOC ITEM # 13b Table 5

NCAPS

1	Metal Hydroxide Sludge Lagoon	No				No VOC concerns per this ITEM #
2	Hazardous Waste Storage Shed	No				No VOC concerns per this ITEM #
3	Former Waste Oil Storage Tank (7,500 gallon)	No				No VOC concerns per this ITEM #
4	Pickling Line	No				No VOC concerns per this ITEM #
5	Waste Water Treatment System	No				No VOC concerns per this ITEM #
6	Baghouse Storage Area	No				No VOC concerns per this ITEM #
7	Furnaces	No				No VOC concerns per this ITEM #
8	Waste Storage AST (550 gallon)	No				No VOC concerns per this ITEM #
9	Rolling Mills	No				No VOC concerns per this ITEM #
10	Slitting Rooms	No				No VOC concerns per this ITEM #
11	Furnace Oil Spill Area (Stain)	No				No VOC concerns per this ITEM #
12	Machine Shop	Yes		X	No	Go to NCAP ITEM # 12 Table 5
13	Drum Storage Areas	No				No VOC concerns per this ITEM #
14	PCB Storage Area	No				No VOC concerns per this ITEM #

Table 5

ITEM #	Release	INSIDE			OUTSIDE			IN USE	NOT IN USE	VOC Residues Present in Soils? per ITEM # (Yes / No / Unknown)
		CONTAINER / VESSEL		AREA/ZONE	CONTAINER / VESSEL		AREA/ZONE			
		GRADE	BELOW GRADE		GRADE	BELOW GRADE				
Solid Waste Management Units										
1	Former outside drum storage area						X	X		No
Areas of Concern										
3	Former tanks by accounting office building					X			X	Yes
5	Parts washers (4)	X						X		No
13b	Former 4,000 gallon diesel/gasoline tank					X			X	Yes
NCAPS										
12	Machine Shop (refers to parts washer in the maintenance area)	X						X		No

ITEM #	Release	Potential for Migration of VOC to Indoor Ambient Air? per ITEM # (Yes / No / Unknown)	Area Remediated? or Further Investigation Required?
Solid Waste Management Units			
1	Former outside drum storage area	No	Groundwater related to this area will be characterized for VOCs in July 2002, under the Connecticut Property Transfer Law.
Areas of Concern			
3	Former tanks by accounting office building	No	Trace concentrations of BTEX constituents at 10-12 feet below grade in soil below risk based levels
5	Parts washers (4)	No	A 'one time' spill of the parts washer solvent located in the maintenance area onto the concrete floor was immediately remediated.
13b	Former 4,000 gallon diesel/gasoline tank	No	This area was investigated during the Phase III investigation and concentrations of VOC in shallow groundwater were below applicable criteria.
NCAPS			
12	Machine Shop (refers to parts washer in the maintenance area)	No	A 'one time' spill of the parts washer solvent located in the maintenance area onto the concrete floor was immediately remediated.

Notes:
Grade indicates earth surface elevation or lowest interior flooring elevation
"In Use" means if the area in question has trained employees working at that location

ALPHA ANALYTICAL LABORATORIES
NARRATIVE REPORT

Laboratory Job Number: L0110248

Alpha Report L0110248:

Polychlorinated Biphenyls

Please note that the surrogate percent recovery for Decachlorobiphenyl on Alpha Sample(s) L0110248-05 and on the associated Laboratory Duplicate, Blank and Control Sample is below the in-house acceptance criteria for the method. Standard laboratory procedure is to perform re-extraction and re-analysis, however, no sample remains for further action.

GLOSSARY OF TERMS AND SYMBOLS

REF Reference number in which test method may be found.

METHOD Method number by which analysis was performed.

ID Initials of the analyst.

LIMITATION OF LIABILITIES

Alpha Analytical, Inc. performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical, Inc., shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical, Inc. be held liable for any incidental consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical, Inc.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding times and splitting of samples in the field.

PCB soil composite Sample Result

ALPHA ANALYTICAL LABORATORIES
NARRATIVE REPORTLaboratory Job Number: L0111079

Alpha Report L0111079:

PCB

It should be noted that the relative percent difference for the laboratory duplicate associated with Alpha Sample(s) L0111079-01 is outside the acceptance criteria required by the method. The elevated RPDs have been attributed to the non-homogenous nature of the sample utilized for the laboratory duplicate.

Please note that one or more of the surrogate percent recoveries for PCB analysis on Alpha Sample(s) L0111079-01 and the associated laboratory duplicate are not reported due to the high dilution required to quantitate the samples.

Total Metals

It should be noted that the matrix spike percent recovery for the analysis of Cadmium, Copper, and Lead associated with Alpha Sample(s) L0111079-01 is invalid because the sample concentration is greater than four times the spike amount added.

GLOSSARY OF TERMS AND SYMBOLS

- REF Reference number in which test method may be found.
- METHOD Method number by which analysis was performed.
- ID Initials of the analyst.

LIMITATION OF LIABILITIES

Alpha Analytical, Inc. performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical, Inc., shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical, Inc. be held liable for any incidental consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical, Inc.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding times and splitting of samples in the field.

Malcolm Pirnie Inc
100 Roscommon Dr, Suite 100
Middletown CT 06457

Attention: Mr. Harold Moritz

Sample ID#: AD51858-67

This laboratory is in compliance with the QA/QC procedure outlined in EPA 600/4-79-019, Handbook for Analytical Quality in Water and Waste Water, March 1979, and SW846 QA/QC requirements of procedures used.

This report, starting with the cover sheet ending with the chain of custody, consists of 31 pages.

If you have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext. 200.

Sincerely yours,

Phyllis Shiller
Laboratory Director

BQL = Below Quantitation Limit

* Certification *

Connecticut Certified Laboratory Number: PH 0558

New York Certified Laboratory Number: 10916

Massachusetts Certified Laboratory Number: CT 020

The above analyses were conducted in accordance with:

1. APHA Standard Methods for the Examination of Water and Wastewater, 18th Edition, 1992.
2. Clean Water Act, List of Approved Test Procedures, 40 CFR.
3. EPA Test Methods for the Evaluation of Solid Waste, SW-846, 3rd Edition, December, 1987.

SWPC - Surface Water Protection Criteria for Substances in GW discharging to a SW body

Bold - Exceeds Criteria
NE - Not Established
NA - Not Analyzed

PHOENIX 
Environmental Laboratories, Inc.

Wednesday, April 06, 2005

Malcolm Pirnie Inc
100 Roscommon Dr, Suite 100
Middletown CT 06457

Attention: Mr Brian McCarthy
Sample ID#: AG30412-30421

This laboratory is in compliance with the QA/QC procedure outlined in EPA 600/4-79-019, Handbook for Analytical Quality in Water and Waste Water, March 1979, and SW846 QA/QC requirements of procedures used.

If you have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext. 200.

Sincerely yours,

Phyllis Shiller
Laboratory Director

Laboratory Data

Client ID: WATERBURY ROLLING MILLS B 06 (2-4)

Parameter	Result	RL	Units	Date	Time	By	Reference
Percent Solid	87		%	04/12/05	-	O/E	E160.3
Extraction of CT ETPH	Completed			04/12/05		S/O	3550/5030
<u>TPH by GC (Extractable Products)</u>							
Ext. Petroleum HC	450	10	mg/Kg	04/13/05		JRB	M8100CT
Identification	**		mg/Kg	04/13/05		JRB	M8100CT

Comments:

ND=Not detected BDL = Below Detection Limit RL=Reporting Limit

**Petroleum hydrocarbon chromatogram was not a perfect match with any of the standards, but contains discreet peaks in the C12 to C24 range. The sample was quantitated against a C9-C36 standard.

If there are any questions regarding this data, please call Phoenix Client Services at extension 200.

low recovery with control spike

Comment: The MS/MSD for Cu and Zn were outside of acceptance criteria. Sample matrix/homogeneity issues are suspected. The LCS was within control and post digestion spike was 89%

QA/QC Batch Sample No: AG32717 (AG32534)

Surrogate	Method QC Criteria	
	Percent Recovery (Water)	Percent Recovery (Soil/Sediment)
Nitrobenzene-d ₅ (B/N)	35-114	23-120
2-Fluorobiphenyl (B/N)	43-116	30-115
Terphenyl-d ₁₄ (B/N)	33-141	18-137
Phenol-d ₅ (Acid)	10-110	24-113
2-Fluorophenol (Acid)	21-110	25-121
2,4,6-Tribromophenol (Acid)	10-123	19-122
2-Chlorophenol-d ₄ (Acid)	33-110 (advisory)	20-130 (advisory)
1,2-Dichlorobenzene-d ₄ (B/N)	16-110 (advisory)	20-130 (advisory)

If two or more acid or base neutral surrogate compounds fail to meet their recovery acceptance criteria, the laboratory should check calculations, sample preparation logs, the surrogate compound spiking solutions, and the instrument operation. If sample surrogate recoveries do not meet the acceptance criteria, as a result of the above mentioned problems or other unknown problems, the sample should be re-extracted and reanalyzed to determine if the sample matrix is interfering with the surrogate recoveries. Re-extraction and reanalysis are not required if the sample is a QC sample and both the matrix spike and matrix spike duplicate surrogate recoveries failed to meet the acceptance criteria. Reanalysis is required if the failed surrogate recoveries are the result of instrument malfunction. If the sample was re-extracted and reanalyzed and the surrogate recoveries were acceptable in the reanalysis, then only the reanalysis should have been submitted. However, if the re-extracted/reanalyzed sample also recovers the surrogates outside of the acceptance limits, then both analyses should have been submitted.

*The MS/MSD % recovery is calculated using the following equation:

$$\text{Matrix Spike Recovery} = \frac{SSR - SR}{SA} \times 100$$

Where,

SSR = Spiked Sample Result

SR = Sample Result

SA = Spike Added

**The MS/MSD relative percent difference (RPD) is calculated using the following equation:

$$\text{Relative Percent Difference} = \frac{|MSR - MSDR|}{1/2 (MSR + MSDR)} \times 100$$

Where,

MSR = Matrix Spike Recovery

MSDR = Matrix Spike Duplicate Recovery

Note: The vertical bars in the formula indicate the absolute value of the difference, hence the RPD is always positive.

SECTION IX: FIELD DUPLICATE CRITERIA

Refer to Region 1, EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses, Part II, Section VOA/SV-IX-B for field duplicate data validation criteria.

SECTION X: SENSITIVITY CHECK CRITERIA

Refer to Region 1, EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses, Part II, Section VOA/SV-X-B for sensitivity check data validation criteria.

SECTION XI: PE SAMPLES - ACCURACY CHECK CRITERIA

Refer to Region 1, EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses, Part II, Section VOA/SV-XI-B for accuracy check data validation criteria.

SECTION XII: TARGET COMPOUND IDENTIFICATION CRITERIA

Refer to Region 1, EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses, Part II,

SECTION VIII: MATRIX SPIKE/ MATRIX SPIKE DUPLICATE CRITERIA

Refer to Region 1, EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses, Part II, Section VOA/SV-VIII-B for MS/MSD data validation criteria and the following method MS/MSD QC criteria:

A matrix spike and matrix spike duplicate must be extracted and analyzed for each group of samples of a similar matrix for each SDG, or each matrix within an SDG or each group of samples of a similar concentration level. The following advisory matrix spike compound recoveries and RPDs are listed below:

MS/MSD base neutral compounds 1,4-dichlorobenzene, N-nitroso-di-n-propylamine, 1,2,4-trichlorobenzene, acenaphthene, 2,4-dinitrotoluene, and pyrene are spiked at a concentration of 100 ug/mL and MS/MSD acid compounds phenol, 2-chlorophenol, 4-chloro-3-methylphenol, 4-nitrophenol, and pentachlorophenol are spiked at a concentration of 150 ug/mL.

Table App.B.VIII-1 - MATRIX SPIKE RECOVERY AND RELATIVE PERCENT DIFFERENCE LIMITS

Compound	Method QC Criteria			
	Water		Soil/Sediment	
	% Recovery*	RPD**	% Recovery	RPD
Phenol	12-110	42	26-90	35
2-Chlorophenol	27-123	40	25-102	50
1,4-Dichlorobenzene	36-97	28	28-104	27

PHOENIX 
Environmental Laboratories, Inc.

Monday, May 02, 2005

Malcolm Pirnie Inc
100 Roscommon Dr, Suite 100
Middletown CT 06457

Attention: Mr Brian McCarthy

Sample ID#: AG34843-34873 AG34930-34931 & AG35045

This laboratory is in compliance with the QA/QC procedure outlined in EPA 600/4-79-019, Handbook for Analytical Quality in Water and Waste Water, March 1979, and SW846 QA/QC requirements of procedures used.

If you have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext. 200.

Sincerely yours,

Phyllis Shiller
Laboratory Director

Comments:

ND=Not detected BDL = Below Detection Limit RL=Reporting Limit

**Petroleum hydrocarbon chromatogram was not a perfect match with any of the standards, but contains discreet peaks in the C9 to C24 range. The sample was quantitated against a C9-C36 standard.
