

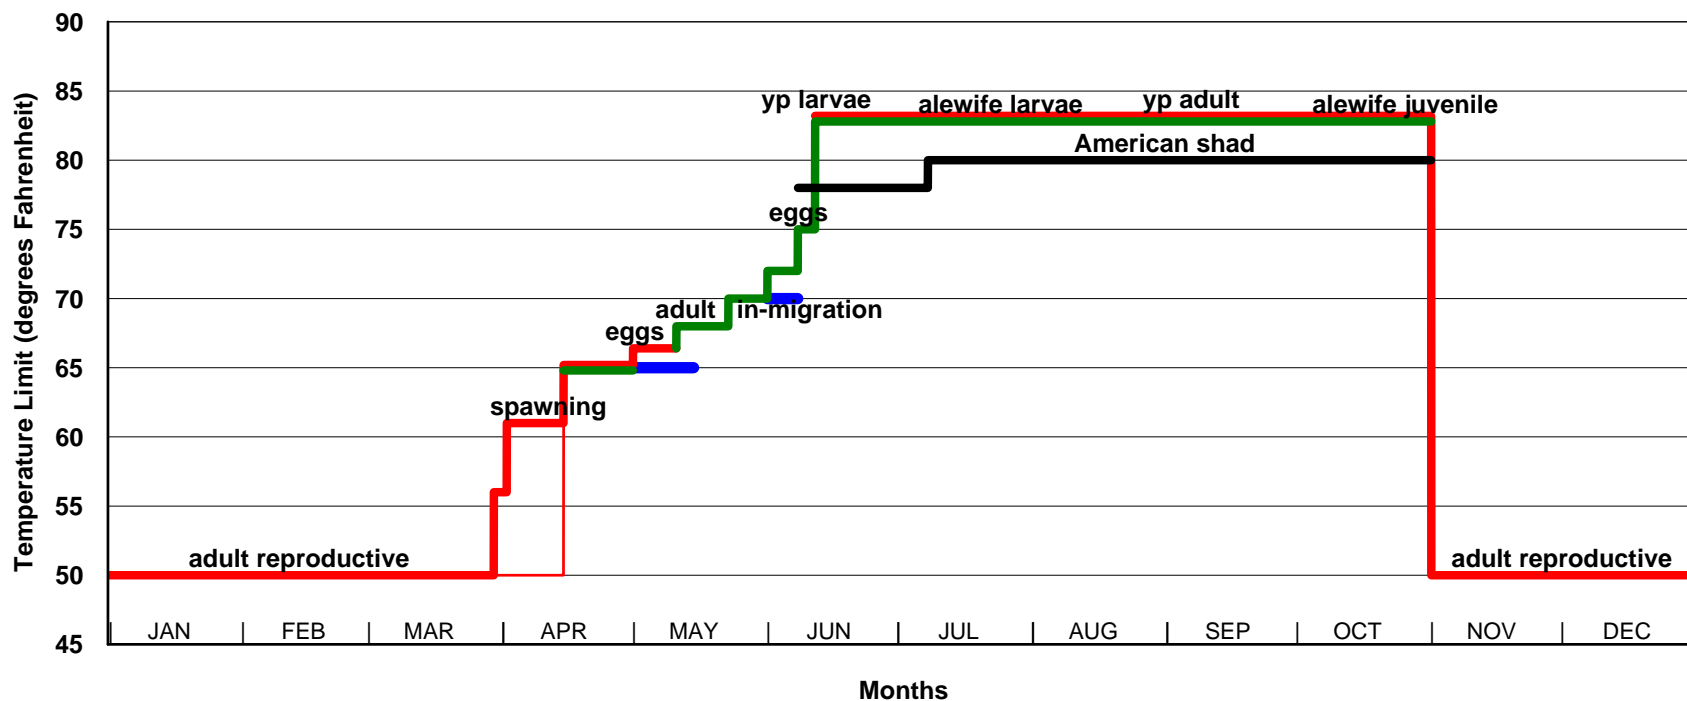

Figure 5.8.1-1 Protective temperature limits and time periods for the most sensitive resident species and the most sensitive anadromous species, organized by month. When two different temperature limits were identified for the same time period, the lowest protective temperature was used as the limit, for as long as it applied. The life stages being protected are also identified. Additional protective temperatures in effect at Station 8 are included. American shad protective temperature values are included for information only at this time.

Station 8 Limits    Resident Species    Anadromous Species    Extended Period    American Shad
