

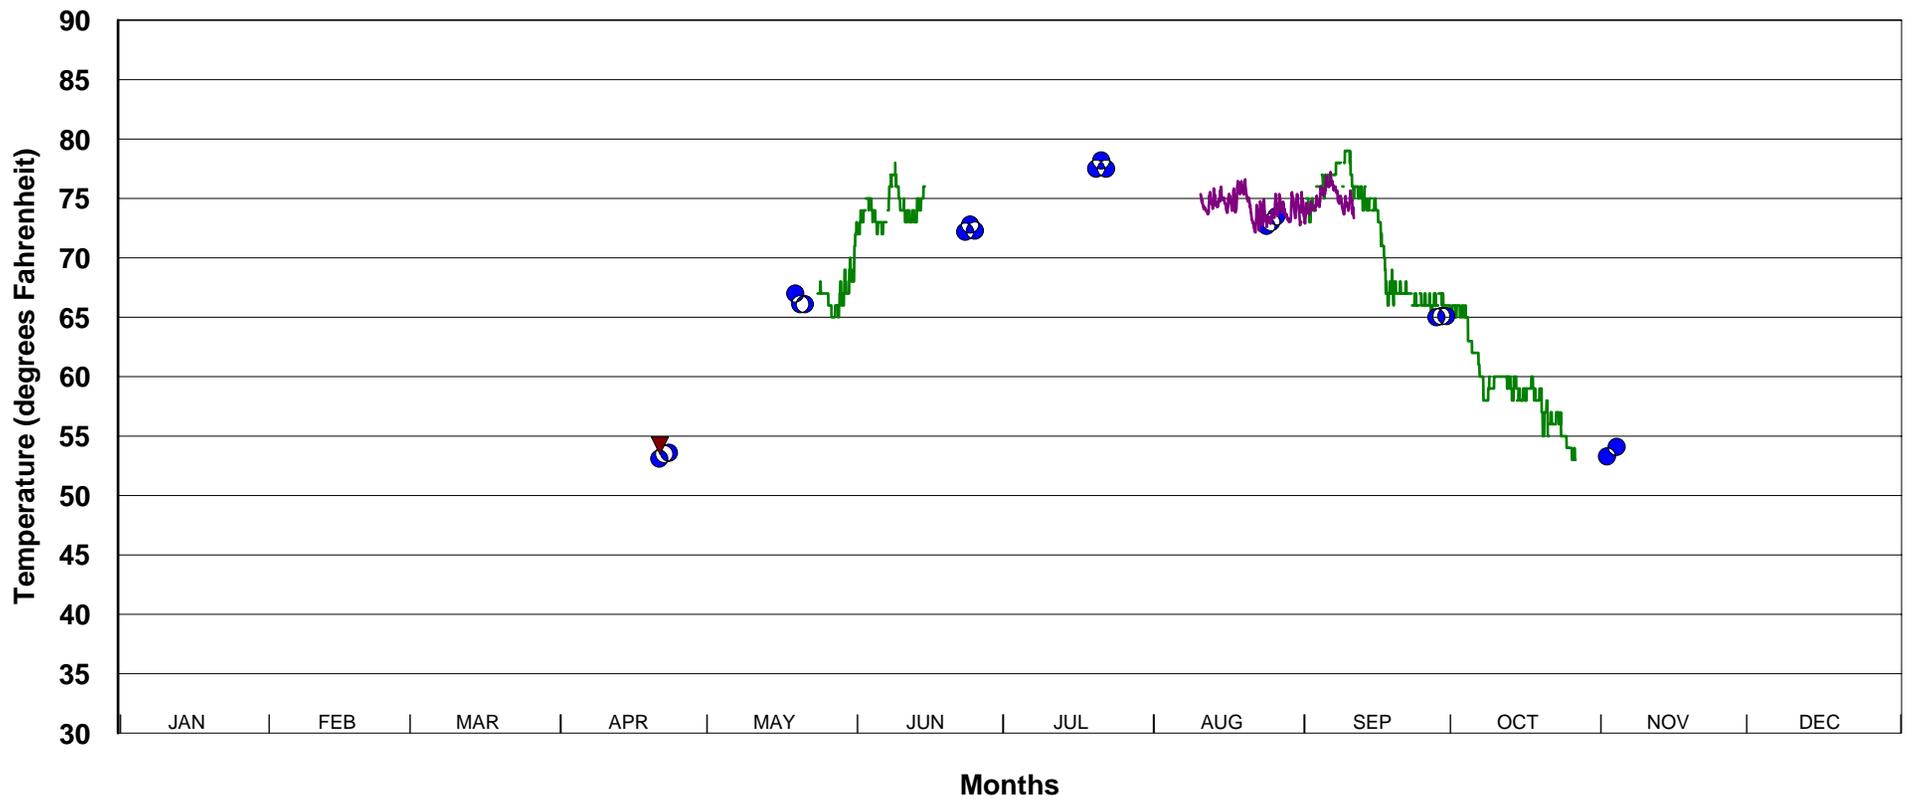

Figure 5.9.2-12 Kendall Station cooling water intake continuous temperatures compared with discrete temperatures collected by the Massachusetts Water Resources Authority (MWRA). MWRA value was averaged from a near surface and a near bottom temperature taken near the BU Bridge. The same calculation was performed on Hyatt Station data collected further downstream in the basin. Intake temperatures from June 15 through August 31 were not judged to generally reflect ambient basin temperatures and were removed from the figure. Available continuous temperature data recorded by Mirant (MRI) at the BU Bridge were also included (January - December 1999).
