NPDES PII Small MS4 General Permit
Annual Report

Part I. General Information

Contact Person: Keith Silver
Title: Highway Superintendent

Telephone #: 508-285-0237
Email: highway@nortonmaus.com

Certification:

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Title: Town Manager
Date: October 7, 2005
Part II. Self-Assessment

The Town of Norton has completed the required self-assessment and have determined that our municipality is in compliance with all permit conditions, except for the following provisions:

Part 4.2.3  (BMP ID #2b)-A Committee has not been formed as of Permit Year 2 end. As of 9-15-05 a committee has been formed consisting of key town employees. See attached letter.

Part 4.2.3  (BMP ID #2c)-The Town of Norton has not yet sponsored an annual stream clean up day, but the Highway Department crews clean around streams annually and when needed.

Part 4.3.3  (BMP ID #3a)-The Town of Norton was unsuccessful in the development and adoption of an illicit discharge by-law before Permit Year Two end. As of 10-5-05 the SAC committee is developing and reviewing the by-law in hopes to have it adopted by the 2006 Spring Town meeting.

Part 4.4.3  (BMP ID #4a)-The Town of Norton was unable to develop new by-laws for construction run-off before Permit Year Two end. This by-law is in the process of being developed and reviewed in hopes to be completed and adopted before Permit Year three’s end.

Part 5.0  Failed to submit annual report on or before May 1st. Submitted report October 11th.
Part III. Summary of Minimum Control Measures

1. Public Education and Outreach

September 15, 2005

Ms. Thelma Murphy, Stormwater Coordinator  
United States Environmental Protection Agency  
Region 1  
One Congress Street, Suite 1100  
Boston, Massachusetts 02114-2023

Re: Annual Report

Dear Ms. Murphy:

Please be advised that the Town of Norton’s Stormwater Management Committee is composed of the following parties:

Keith Silver  
Highway Superintendent
Tracy St. Germain  
Secretary
Jennifer Carlino  
Conservation Agent
James Purcell  
Town Manager
Duane Knapp  
Water/Sewer Superintendent
Charles Gabriel  
Town Planner

The Committee has worked with its consulting engineers on compliance issues and the development of municipal stormwater management regulations. Said regulations will be resubmitted to Town Meeting in the Spring of 2006.

Sincerely,

James P. Purcell  
Town Manager

mtb

pc: Stormwater Management Committee
Norton, Massachusetts

Highway Department / Public Works

Description:
The Highway Department maintains town roads. Contact our office for further details.

Stormwater Management Program

Choose Your Destination

To Contact the Norton Web Site Committee E-mail Webmaster@nortonma.org.
Stormwater runoff occurs when precipitation from rain or snowmelt flows over the ground. Impervious surfaces like driveways, sidewalks, and streets prevent stormwater from naturally soaking into the ground.

Polluted stormwater runoff can have many adverse effects on plants, fish, animals, and people:

- Sediment can cloud the water and make it difficult or impossible for aquatic plants to grow. Sediment also can destroy aquatic habitats.
- Excess nutrients can cause algae blooms. When algae die, they sink to the bottom and decompose in a process that removes oxygen from the water. Fish and other aquatic organisms can’t exist in water with low dissolved oxygen levels.
- Bacteria and other pathogens can wash into swimming areas and create health hazards, often making beach closures necessary.
- Debris—plastic bags, six-pack rings, bottles, and cigarette butts—washed into waterbodies can choke, suffocate, or disable aquatic life like ducks, fish, turtles, and birds.
- Household hazardous wastes like insecticides, pesticides, paint, solvents, used motor oil, and other auto fluids can poison aquatic life. Land animals and people can become sick or die from eating diseased fish and shellfish or ingesting polluted water.

Polluted stormwater often affects drinking water sources. This, in turn, can affect human health and increase drinking water treatment costs.

Stormwater can pick up debris, chemicals, dirt, and other pollutants and flow into a storm sewer system or directly to a lake, stream, river, wetland, or coastal water. Anything that enters a storm sewer system is discharged untreated into the waterbodies we use for swimming, fishing, and providing drinking water.
Stormwater Pollution Solutions

Residential

Recycle or properly dispose of household products that contain chemicals, such as insecticides, pesticides, paint, solvents, and used motor oil and other auto fluids. Don’t pour these onto the ground or into storm drains.

Lawn care

Excess fertilizers and pesticides applied to lawns and gardens wash off and pollute streams. In addition, yard clippings and leaves can wash into storm drains and contribute nutrients and organic matter to streams.

• Don’t overwater your lawn. Consider using a soaker hose instead of a sprinkler.
• Use pesticides and fertilizers sparingly. When use is necessary, use these chemicals in the recommended amounts. Use organic mulch or safer pest control methods whenever possible.
• Compost or mulch yard waste. Don’t leave it in the street or sweep it into storm drains or streams.
• Cover piles of dirt or mulch being used in landscaping projects.

Auto care

Washing your car and degreasing auto parts at home can send detergents and other contaminants through the storm sewer system. Dumping automotive fluids into storm drains has the same result as dumping the materials directly into a waterbody.

• Use a commercial car wash that treats or recycles its wastewater, or wash your car on your yard so the water infiltrates into the ground.
• Repair leaks and dispose of used auto fluids and batteries at designated drop-off or recycling locations.

Septic systems

Leaking and poorly maintained septic systems release nutrients and pathogens (bacteria and viruses) that can be picked up by stormwater and discharged into nearby waterbodies. Pathogens can cause public health problems and environmental concerns.

• Inspect your system every 3 years and pump your tank as necessary (every 3 to 5 years).
• Don’t dispose of household hazardous waste in sinks or toilets.

Pet waste

Pet waste can be a major source of bacteria and excess nutrients in local waters.

• When walking your pet, remember to pick up the waste and dispose of it properly. Flush pet waste in the best disposal method. Leaving pet waste on the ground increases public health risks by allowing harmful bacteria and nutrients to wash into the storm drain and eventually into local waterbodies.

Residential landscaping

Permeable Pavement—Traditional concrete and asphalt don’t allow water to soak into the ground. Instead these surfaces rely on storm drains to divert unwanted water. Permeable pavement systems allow rain and snowmelt to soak through, decreasing stormwater runoff.

Rain Barrels—You can collect rainwater from rooftops in mosquito-proof containers. The water can be used later on lawns or garden areas.

Rain Gardens and Grassy Swales—Specially designed areas planted with native plants can provide natural places for rainwater to collect and soak into the ground. Rain from rooftop areas or paved areas can be diverted into these areas rather than into storm drains.

Vegetated Filter Strips—Filter strips are areas of native grass or plants created along roads or streets. They trap the pollutants stormwater picks up as it flows across driveways and streets.

Commercial

Dirt, oil, and debris that collect in parking lots and paved areas can be washed into the storm sewer system and eventually enter local waterbodies.

• Sweep up litter and debris from sidewalks, driveways and parking lots, especially around storm drains.
• Cover grease storage and dumpsters and keep them clean to avoid leaks.
• Report any chemical spill to the local hazardous waste cleanup team. They’ll know the best way to keep spills from harming the environment.

Construction

Lack of vegetation on streambanks can lead to erosion. Overgrazed pastures can also contribute excessive amounts of sediment to local waterbodies. Excess fertilizers and pesticides can poison aquatic animals and lead to destructive algae blooms. Livestock in streams can contaminate waterways with bacteria, making them unsafe for human contact.

• Keep livestock away from streambanks and provide them a water source away from waterbodies.
• Store and apply manure away from waterbodies and in accordance with a nutrient management plan.
• Vegetate riparian areas along waterways.
• Rotate animal grazing to prevent soil erosion in fields.
• Apply fertilizers and pesticides according to label instructions to save money and minimize pollution.

Agriculture

Improperly managed logging operations can result in erosion and sedimentation.

• Conduct preharvest planning to prevent erosion and lower costs.
• Use logging methods and equipment that minimize soil disturbance.
• Plan and design skid trails, yard areas, and truck access roads to minimize stream crossings and avoid disturbing the forest floor.
• Construct stream crossings so that they minimize erosion and physical changes to streams.
• Expedite revegetation of cleared areas.

Automotive Facilities

Uncovered fueling stations allow spills to be washed into storm drains. Cars waiting to be repaired can leak fuel, oil, and other harmful fluids that can be picked up by stormwater.

• Clean up spills immediately and properly dispose of cleanup materials.
• Provide cover over fueling stations and design or retrofit facilities for spill containment.
• Properly maintain fleet vehicles to prevent oil, gas, and other discharges from being washed into local waterbodies.
• Install and maintain oil/water separators.

RE: NPDES Permit

Date: December 10, 2004

Attached is a copy of the press release that the Conservation Commission is submitting to local newspapers. Eagle Scout Candidate Curtis McKeown has completed a public education project that I believe we can use as part of our permit requirements. This press release can be included in the next update for the town’s NPDES permit. Thank you.
December 10, 2004

For immediate release:

The Norton Conservation Commission would like to acknowledge Eagle Scout Candidate, Curtis McKeown, for his project in the "K Streets" subdivision. Mr. McKeown has stenciled 48 catch basins on Kingsley, Knollwood, Kilsyth, Kensington, Keith and Keene Streets in Norton. Catch basins are the drains in the street that carry storm water from the road to a wetland area. The stenciling notifies homeowners that the catch basins drain to wetlands and streams within the Canoe River watershed and that items should not be dumped into the basins. The stenciling should remind residents that our water resources are fragile ecosystems and that pollution, both point source and non-point source, can harm our drinking water supplies. Pet waste, motor oil, household waste, fertilizers, pesticides, paint and other materials should never be dumped into catch basins. Mr. McKeown's project will also assist the town with its National Pollution Elimination Discharge System (NPDES) Stormwater General Permit as part of the public education the requirement. The Conservation Commission thanks Curtis McKeown for all of his work on this project.
