Part II. Self-Assessment

The Town of Longmeadow performed a review of the Town's progress on the goals for meeting the minimum control measures under the NPDES MS4 Phase II permit. The Town publicizes stormwater related issues and supports and encourages active participation by Town residents in addressing pollution and stormwater concerns. The town previously completed maps of stormwater outfalls, and continued to update the map of drainage culverts, manholes, and catchbasins. Town staff inspected outfalls, catchbasins, and culverts for potential illicit discharges. The Town has continued review of existing regulations, including the Massachusetts Wetlands Protection Act and the MADEP Stormwater Management Standards, and has previously enacted appropriate bylaws. The Town's efforts to meet the identified measurable goals including ongoing compliance efforts are briefly summarized in Part III Summary of Minimum Control Measures.

Acronyms Used in Following Pages

Con. Com. = Conservation Commission

DPW = Department of Public Works

PVPC = Pioneer Valley Planning Commission

Part III. Summary of Minimum Control Measures

1. Public Education and Outreach

BMP ID #	BMP Description	Responsible Dept./Person Name	Measurable Goal(s)	Progress on Goal(s) – Permit Year 13 (Reliance on non-municipal partners indicated, if any)	Additional Planned Activities
1A	Hazardous Waste Day	Board of Health/DPW	Give residents opportunity to drop off hazardous waste	Hazardous Waste day was held in September of 2015.	Hazardous Waste day is scheduled for September of 2016.
1B	Pet Waste Bylaw	Public Works Director	Completed	Bylaw in place. Public education included posting notice on web page. Distributed pet waste flyers prepared by PVPC.	Public education: to include posting notices through press releases.
1C	Longmeadow Website	Town Engineer	NPDES Information on DPW website	The Department of Public Works has incorporated NPDES information on the town web site.	The Department of Public Works will continue to incorporate NPDES information on town web site.
1D	Public Outreach	PVPC	Variety of public outreach activities	Contributed \$2,000 to participate in regional public outreach and education stormwater program. Actively participated in committee programs.	Continue to be part of PVPC's regional public outreach and education stormwater program.
1E	Newspaper Press Releases	Town Engineer	Publish stormwater/ water quality info 2x / year	Advertised sale of rain barrels in newspaper and submitted articles on stormwater issues.	Publish stormwater/water quality info twice per year.
1F	Classroom Education	School District/Town Engineer	Incorporate water quality into curriculum	Offered grant as part of regional planning organization for curriculum development. Distributed curriculum prepared by grant to schools for use.	Work with School science coordinators to incorporate into curriculum.
1G	Public displays/handout	Public Works Director	Post stormwater related educational posters and handouts in Town Hall	Posted stormwater related educational posters and handouts in Town Hall. Distributed "Greenscapes" materials to public. Displayed materials at "Longmeadow Days" Town Fair. Included bill stuffers on lawn care practices.	Post stormwater related educational posters and handouts in Town Hall. Greenscapes materials distribution to public. Post materials at Longmeadow Days. Bill stuffers on conservation and "green" topics.
1H	Public Announcements	Town Engineer	Present Public Service Announcement (PSA) on local cable station	Stormwater program PSA aired on the cable channel throughout the year.	Periodic airings of PSAs.

2. Public Involvement and Participation

BMP ID #	BMP Description	Responsible Dept./Person Name	Measurable Goal(s)	Progress on Goal(s) – Permit Year 12 (Reliance on non-municipal partners indicated, if any)	Additional Planned Activities
2A	Stream Cleanup and Monitoring	DPW Director and Town Engineer	Organize concerned residents to walk and clean up stream. Support interested groups by providing tools and disposing of trash bagged by participants.	Continued discussions with Con Com to develop ideas and cooperative efforts. Supported Connecticut River Cleanup activities by providing availability for participants to arrange for the Town to pick up and dispose trash bags if requested.	Continue to support interested groups by providing tools and disposing of trash bagged by participants. Providing flyers regarding disposal of dog waste.
2B	Adopt a Stream	Public Works Director	Organize concerned citizens to adopt streams. Support interested groups by providing tools and disposing of trash bagged by participants.	Supported Connecticut River Cleanup activities by providing availability for participants to arrange for the Town to pick up and dispose trash bags if requested.	Continue to support interested groups by providing tools and disposing of trash bagged by participants.
2C	Stormwater Committee	Board of Selectmen	Stormwater Committee formed	Previously formed stormwater committee with representation from Conservation, Board of Health, Building, Planning and DPW.	Raised issues at select board meeting to promote stormwater utility. Included in annual Engineering Report.
2D	Invasive Species Removal	Public Works Director	Provide appropriate disposal area for removed vegetation	Previously provided appropriate disposal area for water chestnut vegetation removed by volunteers coordinated by EPA.	Continue to provide appropriate disposal area for removed vegetation to support efforts to eradicate invasive species.
2E	Adopt-a-Triangle	Parks Dept.	Support interested groups by providing tools and disposing of trash bagged by participants.	Supported volunteer activities by picking up and disposing of trash bagged by participants.	Support interested groups by providing tools and disposing of trash bagged by participants.

3. Illicit Discharge Detection and Elimination

BMP ID #	BMP Description	Responsible Dept./Person Name	Measurable Goal(s)	Progress on Goal(s) – Permit Year 12 (Reliance on non-municipal partners indicated, if any)	Additional Planned Activities
3A	Sanitary Sewer Maintenance Program	Public Works Assistant Director	Develop plan of cleaning and inspecting sewer mains	Town continued to inspect sewer interceptors along brook valleys to identify areas of breakage, erosion, or other physical conditions that may impair the integrity of the pipeline. Continued to video inspect sewer system in 2015 as deficiencies became suspected.	Continue to inspect sewer interceptors for potential impact to resource areas. Perform video inspection of sewers in 2016. Repair leaks as required.
3B	Storm Drain System Map	Engineering Dept/Town Engineer	Develop a storm sewer system map and locate outfalls	Outfalls have previously been located by GPS. Data has been downloaded into AutoCAD and GIS programs to produce accurate storm sewer mapping.	Continue developing the storm sewer map and GIS to organize system data and maintenance efforts. Continued Update GIS Map. During April 2016, engineering department began project to inspect all outfalls in Town under a new reporting system.
3C	Non-Stormwater Bylaw	Town Engineer	Bylaw established	Town had previously approved bylaw at Town meeting. ConCom reviewed project for compliance with the MA Stormwater Management Standards under the MA Wetlands Protection Act.	
3D	Entrance Permit	Public Works Director	Completed	Discussed options for permitting and including language in deeds making owner responsible for discharges.	Continue to work with Town Attorney and Select Board to determine best course of action.
3E	Develop Illicit Discharge Program	Town Engineer	Completed	DPW has previously approved a bylaw to address illicit discharges and connections. Although no formal outfall inspection efforts took place, several outfalls were inspected as part of ongoing maintenance and service calls from residents.	Conform to approved bylaw as applicable. Engineering department has planned for a comprehensive outfall inspection effort for April 2016.
3F	Illegal Dumping	Public Works Director	Perform regular patrols/cleanup	DPW performed regular patrols and cleaned up illegal dumped trash.	Continue to perform regular patrols/cleanup.

3G	Assess Outfalls	Engineering	Assess 10% of municipal outfalls per year	DPW inspected municipal outfalls in 2015 only as required per ongoing maintenance and service calls from residents.	Comprehensive outfall inspection program to be completed under new reporting protocol (April 2016).
----	-----------------	-------------	---	---	---

4. Construction Site Stormwater Runoff Control

BMP ID #	BMP Description	Responsible Dept./Person Name	Measurable Goal(s)	Progress on Goal(s) – Permit Year 12 (Reliance on non-municipal partners indicated, if any)	Additional Planned Activities
4A	Stormwater Pollution Prevention Plan for Construction	Public Works Director/Town Engineer	Require pollution prevention plan for construction sites	Town previously approved bylaw at Town meeting. ConCom reviews project for compliance with the MA Stormwater Management Standards under the MA Wetlands Protection Act.	Identify if additional regulations are needed, draft regulations for Town Meeting vote if necessary. Develop inspection program for all significant construction projects. Work with Building department to control and contain stormwater.
4B	Construction Runoff Bylaw	PB/ Con Com/ DPW	bylaw.	Town approved bylaw at Town meeting. ConCom reviews project for compliance with the MA Stormwater Management Standards under the MA Wetlands Protection Act.	Identify if additional regulations are needed, draft regulations for Town Meeting vote. Develop inspection program for all significant construction projects. Work with Building department to control and contain stormwater.
4C	Plan Review	PB/ Con Com/ DPW/BOH	Enforcement under bylaw	Continued plan review per new bylaw.	Continue plan reviews per new bylaws. Bylaw enforcement proposed following enactment.
4D	Inspection / Reporting	DPW/PB/ Con Com	Enforcement under bylaw	Continued inspection /reporting under existing regulations.	Continue to inspect/report per existing regulations. Bylaw enforcement proposed following enactment.

5. Post-Construction Stormwater Management in New Development and Redevelopment

BMP ID #	BMP Description	Responsible Dept./Person Name	Measurable Goal(s)	Progress on Goal(s) – Permit Year 12 (Reliance on non-municipal partners indicated, if any)	Additional Planned Activities
5A	Post Construction Runoff Bylaw	Director DPW	Bylaw Established	Town previously approved bylaw at Town Meeting. ConCom reviews project for compliance with the MA Stormwater Management Standards under the MA Wetlands Protection Act.	Identify if additional regulations are needed, draft regulations for Town Meeting vote.
5B	Construction Site Plan Review	PB/ Con Com/ DPW	Enforcement under bylaw	Continued plan review per new regulations.	Continue plan review per new regulations. Bylaw enforcement to be part of plan.
5C	Stormwater System Maintenance Plan	PB/Con Com/ DPW	Enforcement under bylaw	Continued inspection / reporting under new regulations.	Continued inspection / reporting under new regulations. Bylaw enforcement proposed following enactment.

6. Pollution Prevention and Good Housekeeping in Municipal Operations

BMP ID #	BMP Description	Responsible Dept./Person Name	Measurable Goal(s)	Progress on Goal(s) – Permit Year 12 (Reliance on non-municipal partners indicated, if any)	Additional Planned Activities
6A	Catch Basin Maintenance	Public Works Deputy Director for Highways	Organize program for cleaning and inspecting catch basins. Clean 400 catch basins annually	Approximately 25 catch basins were cleaned and inspected . All catchbasins within paving & sewer projects were evaluated and repaired/replaced as necessary.(and as resources were available). Video inspected suspect drain lines.	Anticipate cleaning approximately 400 catchbasins. Repair and replace as necessary.
6B	Street Sweeping	Public Works Deputy Director for Highways	Organize program for sweeping streets	100% of paved town streets were swept in the month of April. Certain commercial area streets were swept two or three times.	Continue to street sweep per existing program.
6C	Municipal Maintenance Activity Program	DPW Director	Evaluate and draft additional policies	Reviewed existing policies as needs arised.	Continue to review existing policies. Formalize in writing and draft new policies as necessary.
6D	Training of all municipal employees	DPW Director and Deputy Director for Highways	Initiate good housekeeping training	In-house training is performed for new hires or any personnel transferring within DPW.	Conduct good housekeeping training June 2016.

7. BMPs for Meeting Total Maximum Daily Load (TMDL) Waste Load Allocations (WLA) <<if applicable>>

BMP ID #	BMP Description	Responsible Dept./Person Name	Measurable Goal(s)	Progress on Goal(s) – Permit Year 12 (Reliance on non-municipal partners indicated, if any)	Additional Planned Activities
7A	TMDL	Various	Performance of previously identified BMPs.	The BMPs described in the above tasks will also address TMDL issues in the Connecticut River.	The BMPs described in the above tasks will also address TMDL issues in the Connecticut River.

**Connecticut River Stormwater Committee
Annual Report
April 1, 2015 to March 31, 2016**

The Connecticut River Stormwater Committee

The Connecticut River Stormwater Committee is an intergovernmental compact of 13 municipalities organized to collaborate on education and outreach about stormwater impacts on the Connecticut River. Facilitated and staffed by the Pioneer Valley Planning Commission, committee work helps NPDES MS4 regulated member communities meet stormwater education and outreach permit requirements. Based on the Memorandum of Agreement under which the committee was formed in 2008, work also helps member communities with related bylaws/ordinances and other compliance measures. Member communities are shown in Table 1 below.

Table 1: Connecticut River Stormwater Committee Member Communities

Member Community	Committee Representatives and Departments
Agawam	Tracey DeMaio, Department of Public Works
Chicopee	Quinn Lonczak, Department of Public Works
Easthampton	Jim Gracia, Department of Public Works
Granby	Dave Derosiers, Highway Department
Holyoke	Yem Lip, Department of Public Works
Longmeadow	Mario Mazza, Department of Public Works
Ludlow	JT Gaucher, Department of Public Works
Northampton	Doug McDonald, Department of Public Works
Southwick	Randall Brown and Richard Grannells, Department of Public Works
South Hadley	Melissa LaBonte, Department of Public Works
Springfield	Kevin Chaffee, Planning/Conservation
West Springfield	Jim Lyons and Amanda Santaniello, Department of Public Works
Westfield	Casey Berube, Department of Public Works

Education and Outreach over the Past Year

The Stormwater Committee has been in a transition phase over the past year, continuing education and outreach under the requirements of the 2003 permit, but taking important steps in preparing for the forthcoming 2016 permit. In some cases the work of preparing for the forthcoming permit has served to provide education and outreach under the 2003 permit. This is especially the case with the pet waste practices survey that went to dog owners throughout Stormwater Committee communities (described in greater detail below).

The narrative below summarizes the work of the Connecticut River Stormwater Committee during the 2016 reporting year, which includes the following:

- Promoted Soak up the Rain stormwater education campaign
- Designed and constructed 3 demonstration rain gardens with 2 hands-on training events

- Defined program of effective messaging on bacteria/pet waste management
- Began to define program of effective messaging on nutrients
- Discontinued collaboration with Greenscapes Program
- Began retooling website education and outreach for the Pioneer Valley
- Led first phase of urban tree planting project in Chicopee, Holyoke, and Springfield
- Collaborated with Massachusetts state-wide coalition of stormwater coalitions

1. Promoted "Soak up the Rain" stormwater education campaign

The Connecticut River Stormwater Committee continued to develop and promote the "Pioneer Valley Soak up the Rain" education campaign (a local version of the EPA's New England campaign). The campaign, a call to action for property owners to reduce stormwater runoff through strategies that soak up the rain, involved two outreach efforts for the Connecticut River this year:

Pioneer Valley Soak up the Rain Website www.pvpc.org/soakuptherain/

The Stormwater Committee continues to maintain the Pioneer Valley Soak up the Rain website, which promotes a range of practices, including tree plantings, rain gardens, permeable pavements, dry wells, and green roofs. An occasional blog that includes photos and video provides examples from the region. Property owners throughout the Pioneer Valley are also invited to submit projects that they know of to feature on the website. A "Cool resources" heading provides connection to the latest information and a "resources" menu item links to a library of informational resources. In the past year, the website had 33,997 hits with 12,095 of these hits resulting in information requests being sent to the user. Links to this website are on all member community stormwater web pages.

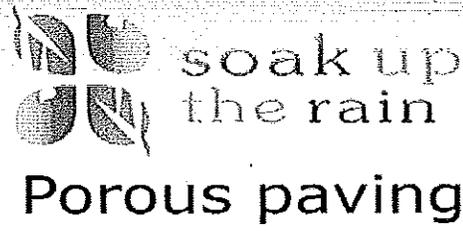

Soak up the Rain Signs for rain gardens and porous paving projects

The Stormwater Committee produced 150 Soak up the Rain signs, including 100 for rain gardens and 50 for porous paving. Each of the signs has two different sides to them, giving property owners the option to display a message that connotes pride in having such a facility or a more involved message that describes what the system does. Signs have been distributed to Stormwater Committee communities for use at green infrastructure stormwater management projects in their jurisdictions and distributed also to residential and business property owners with high profile projects. The Committee will continue to distribute and display signs to further the message about soaking up the rain. *See sign design below.*

Rain garden signs – both sides

Keep our rivers clean

Porous paving

Connecticut River Stormwater Committee
soakuptherain.pvpc.org

Porous paving

This paving is designed to let rainfall or snowmelt soak into the ground...

- reducing flooding
- replenishing groundwater drinking sources; and
- eliminating flows that carry pollutants to nearby rivers

Connecticut River Stormwater Committee
soakuptherain.pvpc.org

Porous paving signs – both sides

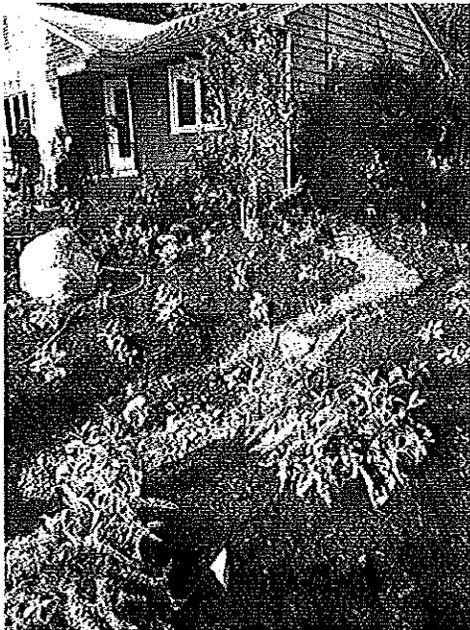

2. Designed and constructed 3 demonstration rain gardens with 2 hands-on training events

PVPC continued work with the Regenerative Design Group to design and construct demonstration rain gardens in Springfield. Two of the three projects to date have also included hands-on trainings to build regional know-how in the design and installation of rain gardens. Trainees then helped by volunteering to install plants in each of the rain gardens. Though rain garden facilities are located in Springfield, trainings have been advertised throughout the region to include all Stormwater Committee communities. The three rain garden projects to date have included:

<i>Rain garden address</i>	<i>Description of facility</i>	<i>Training details</i>
Birchland Avenue - residential demonstration project	370 square foot facility that has capacity to capture and soak up 1,384 gallons of rainfall from portion of rooftop.	NA
Springfield Museums - institutional demonstration project	2,900 square foot facility near Chestnut Street that has capacity to capture and soak up 11,800 gallons from half of large rooftop on Kilroy House	Training on May 16 drew 21 participants from several stormwater committee communities. Program began with overview on the nature of stormwater impacts on the Connecticut River and the advantages of capture and infiltration of flows using rain gardens to avert flooding and pollution, and promote improved aesthetics. The training then provided detail on site evaluation, design strategy, site preparation, and installation.
Gardening the Community - community demonstration project	1,000 square foot facility along Walnut and James Streets that has capacity to capture and soak	Training on October 3 drew 22 participants from various stormwater committee communities. Program

	<p>up 3,740 gallons from paved parking lot:- this is a new community garden site and the rain garden is part of the 1st phase of construction</p>	<p>began with overview on the nature of stormwater impacts on the Connecticut River and the advantages of capture and infiltration of flows using rain gardens to avert flooding and pollution, and promote improved aesthetics. The training then provided detail on site evaluation, design strategy, site preparation, and installation.</p>
--	---	---

Promoting these trainings entailed reaching out to: Western Massachusetts Master Gardener Association, Ecological Landscape Alliance, local public libraries, and notice placements with area newspapers and social media resources. The rain garden work is made possible through a settlement agreement reached by Clean Water Action. Based on the materials, contracts, and know-how developed through this work in Springfield, this project can be easily duplicated in other stormwater committee member communities for the future. PVPC has talked with both Clean Water Action and MassDEP about additional funding to replicate this program in other communities.

Residential demonstration rain garden in Springfield

Institutional demonstration rain garden at Springfield Museums

Community demonstration rain garden at Gardening the Community's new site at Walnut and James Streets in Springfield

3. Defined program of effective messaging on bacteria/pet waste management

Based on the 2014 draft Massachusetts Municipal Separate Storm Sewer Systems (MS4) permit, the 2016 final permit to be issued by the U.S. Environmental Protection Agency will require urbanized areas draining to the Connecticut River to provide an annual message to encourage proper management of pet waste. Specifically, communities with systems that discharge to bacteria or pathogen impaired waters without an EPA approved TMDL must supplement education and outreach programming, ...with an annual message encouraging the proper management of pet waste, including noting any existing ordinances where appropriate. The permittee or its agents shall disseminate educational materials to dog owners at the time of issuance or renewal of a dog license, or other appropriate time. Education materials shall describe the detrimental impacts of improper management of pet waste, requirements for waste collection and disposal, and penalties for noncompliance.”¹

Messaging on proper management of pet waste is also required in the June/July time frame for communities where there are nitrogen and phosphorous impaired waters.

All 13 member communities of the Connecticut River Stormwater Committee will be subject to these requirements. As such, the Connecticut River Stormwater Committee has been interested in

¹ Note that where appropriate municipalities must also provide messaging around septic system maintenance to help address bacteria impairments.

understanding the effectiveness of past pet waste messaging and how to move forward with messaging under the new permit.

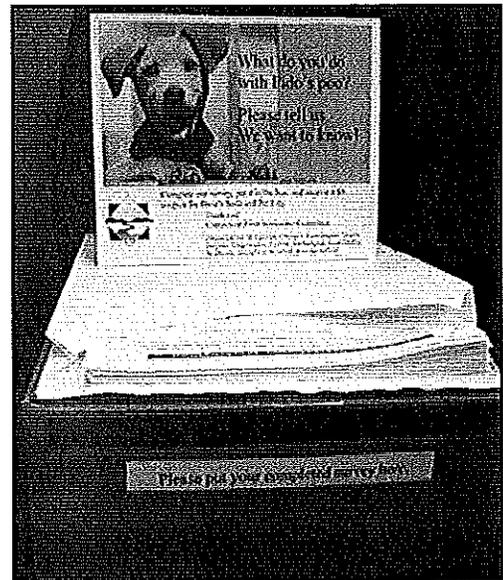

With funding from the Massachusetts Direct Local Technical Assistance Program and match from the Connecticut River Stormwater Committee budget, the Pioneer Valley Planning Commission worked with member communities to devise and distribute a survey to help provide direction on bacteria messaging.

With members of the Connecticut River Stormwater Committee, the Pioneer Valley Planning Commission (PVPC) developed a three-page survey containing 20 questions for dog owners. Survey design was informed by the principles of community based social marketing. As defined by McKenzie-Mohr and Smith, community based social marketing seeks to foster sustainable behavior by first identifying barriers and benefits to a sustainable behavior. They note that barriers may be “internal” to the individual, such as lack of knowledge regarding how to carry out an activity, or external, as in structural changes that need to be made in order for the behavior to be more convenient.² As such, understanding current practices, barriers, and perceptions were integral to the six overarching questions the Stormwater Committee sought to answer through the survey:

1. Has the most recent dog waste messaging through the distribution of posters under the Think Blue Connecticut River campaign reached pet owners and got them to think about their practices?
2. Do people understand the connection between pet waste and stormwater?
3. What are current practices in yards at home, while walking in neighborhood, and walking in public parks?
4. What are the barriers to best practices?
5. What would make best practices easier for dog owners?
6. What are important considerations for messaging about pet waste practices going forward?

PVPC distributed the *paper survey* through animal hospital waiting rooms (see image at right) in Stormwater Committee municipalities and through direct distribution of surveys at two dog parks in the region. A link to the *electronic version of the survey* went by e-mail to clients of Dave's Soda and Pet City and the Northampton Veterinary Clinic. Both survey distribution methods included an incentive – a \$5 coupon to Dave's Soda and Pet City, a local pet store, with franchises throughout the region, which kindly donated the coupons.

A total of 1,279 people completed the survey – 100 paper surveys were collected and 1,179 people completed the online survey. Of the completed surveys, 641 were completed by people who live in Connecticut River Stormwater Committee member communities. The messaging analysis and report focuses on the results from those specific communities.

Box with surveys left in animal hospitals in stormwater committee municipalities.

² From: *Fostering Sustainable Behavior: An Introduction to Community Based Social Marketing*, by Doug McKenzie-Mohr and William Smith, New Society Publishers, 1999.

Major Findings from Survey

Effectiveness of most recent messaging

The past poster message about dog waste in the Connecticut River Think Blue campaign reached 8.7% of survey respondents (59 people) in Connecticut River Stormwater Committee communities. What is interesting is that fully 134 people responded to the follow up question about whether the message got them to change their practices. This may indicate that by virtue of showing the message on the survey page itself, people took in the message and were prompted to consider their practices. Comments seem to reinforce this, with many writing, "I already pick up my pet's waste." Of those 134 survey respondents, nearly 40% indicated that the ad moved them to make "a major change" or "somewhat of a change in their practices." The remaining 60% indicated either "not much of a change," "no change at all," or "not sure." Based on written comments, it is likely that those in this later category are already picking up their dog's waste.

Connection between pet waste and stormwater

The survey indicates widespread awareness that pet waste can affect streams and rivers, with 74.5% recognizing that it contributes either "a great deal," "a moderate amount," or "a little." At the same time, 25.6% of respondents are "not sure" or "do not think" that pet waste is a contributing factor to water pollution.

Current practices (in yards at home, while walking in neighborhood, and walking in public parks or forests)

Regardless of whether they are in their yard with their dog, walking around the neighborhood, or walking at a public park or forest, the majority of respondents report picking up waste. In *their own yard or around the neighborhood*, 88% and 97% of respondents respectively report picking up after their dog, and put the waste in the trash (or for a few, flush it down the toilet).

When asked why they pick up after their dog *in their own yard*, the most common response is "hygiene/health reasons", followed by "courtesy to neighbors," "concern for environment," and "it's the law." When walking a dog *around the neighborhood* or at a *public park or forest*, "courtesy to neighbors" is the most common response, followed by "hygiene/health reasons."

For dog owners who do not pick up after their dog in their yard, a follow-up question on the survey asks to identify the reason why. Of the 125 people who answered this question, 63% stated that they think dog waste is a "natural fertilizer." A smaller number of people felt that it "makes little difference" (15.0%) or it is "too much trouble" (7.2%). From the comments made as part of this question, it is clear that many people who live in more rural locations feel it is not necessary to pick up waste, or that it is not going to contaminate a water supply.

When asked a similar question in regard to *walking their dog in the neighborhood*, 12 people indicated that they don't pick up their dog's waste. In a follow up question, however, 26 people gave reasons for not picking up the dog's waste. Of those, the most popular response was that "it is a natural fertilizer." For a few, "it is too much trouble," or they simply forgot a bag or some other means of picking it up. Lastly, *when at a public park or forest*, 51 people stated they don't pick up after their dog. Of these, the most common reason was that "it is a natural fertilizer," followed by "makes little difference." Some of the comments suggest that if people are far in the woods, they don't see the need to pick it up. Similarly, if they have forgotten a bag, or do not have a way to dispose of the waste (short of bringing it home with them), they are likely to leave it.

There are several themes that emerge from among those who do not pick up after their dog. First, a sizeable number of respondents think of pet waste as a "natural fertilizer" and that it doesn't have a significant effect on water quality. Second, many respondents commented that they live in a rural area, and infer that the waste will decompose along with other wild animals wastes. These results suggest that there is an opportunity to raise awareness about pet waste in the environment and help to change behavior. If dog owners better understand the potential water quality impacts of leaving feces on the ground, they may be more likely not leave it where it falls. As several respondents who do pick up waste referred to the law as a reason, regulations and fines may be another useful strategy for behavior change as well.

Why you do not pick up your dog's waste?

	In yard		In neighborhood		In public park/forest	
	%	Count	%	Count	%	Count
Not concerned	12.0%	15	3.9%	1	7.8%	4
Makes little difference	15.0%	19	0%	0	17.7%	9
Too much trouble	7.2%	9	23.0%	6	13.7%	7
My neighbors don't; so why should I?	1.0%	1	7.7%	2	5.9%	3
It is a natural fertilizer	63.2%	79	50.0%	13	52.9%	27
It is not sanitary to pick up	1.6%	2	15.4%	4	2.0%	1
<i>Total</i>	<i>100.00%</i>	<i>125</i>	<i>100.00%</i>	<i>26</i>	<i>100.00%</i>	<i>51</i>

Generally, people are more likely to pick up after their dog if they are not on their own property. They are also more concerned about "courtesy toward their neighbors" when they are walking in the neighborhood or in a park, and this prompts them to pick up after their dog.

Why do you pick up your dog's waste?

	In yard		In neighborhood		In public park/forest	
	%	Count	%	Count	%	Count
Courtesy to neighbors	28.1%	232	37.4%	367	32.0%	315
Hygiene/health reasons	39.8%	329	30.3%	297	30.0%	294
Concern for the environment	22.3%	184	20.0%	197	24.0%	236
It's the law	9.8%	81	12.3%	121	14.0%	139
<i>Total</i>	<i>100.00%</i>	<i>826</i>	<i>100.00%</i>	<i>982</i>	<i>100.00%</i>	<i>984</i>

Barriers to best practices

Within this survey, responses indicate widespread understanding that pet waste should not be left on the ground, and that there is a responsibility as a pet owner to pick up after dogs. Some comments, however, indicate that despite good behavior reported by the survey respondents, there is a problem with "others" not picking up dog waste.

"It's already quite easy. Wish more people thought this way. It's my worst pet peeve to see dog waste on the ground."

"It's very easy to pick up my dog's poop. There should be no reason why people don't do this. Those that don't are just plain LAZY."

Public works and highway officials on the Connecticut River Stormwater Committee confirm that improper pet waste disposal practices are still a big problem in their communities.

Barriers to best practices evident in comments from survey respondents are:

- the need for greater understanding that pet waste doesn't stay where it falls – that water can carry it (or pieces of it) quite a distance so that it contaminates nearby waterbodies
- the need for greater understanding that pet waste is not a “natural fertilizer”
- lack of receptacles for easy disposal of waste
- winter months when fewer receptacles are out or it is just more difficult to access feces to pick them up
- forgetting bags at home

Making it easier for dog owners to do the right thing

To the question “What would it take to make picking up your dog’s waste easier for you?” many respondents gave more than one response and also provided comments. Responses were as follows:

More receptacles	422 responses
Easier access to bags	286 responses
Monetary fine	17 responses

Seventy six of the respondents also provided comments under “other,” indicating that they already pick up after their dog, or that it’s the right and responsible things to do. A few commented that knowing it’s a potential pollutant is a motivator. One mentioned more posted signs and making it an enforceable law and another said a compost facility so that the waste does not end up at a landfill.

Messaging Going Forward

For behavior change, community based social marketing practitioners have identified some important tools. These include gaining commitments from individuals to develop community norms that encourage people to behave more sustainably. Direct personal contact is a key technique as the research indicates that people are most likely to change some behaviors in response to direct appeals or social support from others. (McKenzie-Mohr and Smith) These are important guidelines in thinking about messaging going forward.

Discussion and key considerations

Most survey respondents report that they pick up their dog’s waste. Strong motivators cited by respondents to picking up dog waste—including health/hygiene reasons and courtesy to neighbors—indicate that campaigns over the years, whether people acknowledge their impact or not, seem to have “normalized” the practice of carrying waste disposal bags, and picking up and disposing of dog waste. The availability of products, including dog waste scoops and the waste bag totes that clip to leashes, have likely also factored into this normalization of practice. From survey responses at least, the “yuck” factor of picking up waste is almost non-existent. [Less than 2% of respondents (1 and 2 people depending on setting: yard, neighborhood, park/forest) indicate they do not pick up waste due to it not being sanitary to pick it up.]

The question remains whether this survey involves a self selected group most of whom “do the right thing” or whether the self reporting within the survey is overly optimistic (at least one past study has noted that people are inclined to want to report that they are “doing the right thing”). Some of the survey comments and certainly the experience of public works and local highway officials on the

Stormwater Committee indicate there remains a problem with people not picking up dog waste or picking it up and disposing of it improperly, either leaving bagged waste on the ground or putting it down the storm drain. As such, effective messaging about dog waste will continue to be important. Following are key considerations in messaging based on survey results:

- Disabuse dog owners of the idea that pet waste is a “natural fertilizer” and inform them about the contamination issues associated with this waste, broadening the understanding of stormwater runoff concepts.
- Encourage homeowners (in both rural and urban areas) to pick up after their dog. Inform homeowners that even though the waste may not initially be located near a storm drain, stream or river, the leachate may travel toward them when carried by rainfall or snowmelt.
- Capitalize on existing motivators to pick up dog waste, particularly health/hygiene reasons and courtesy to neighbors.
- While not as strong a motivator, reminding people of the law and possible consequences of not picking up dog waste could promote best practices
- Undertake a campaign to install more waste disposal facilities, making these facilities more highly visible in public parks, forests, and particularly locations where municipal officials observe persistent problems with proper waste disposal.

Next Steps

Based on survey results, PVPC has developed a draft program of messaging for Stormwater Committee communities on pet waste that includes metrics required under the forthcoming permit. This include proposed formats and venues. The Stormwater Committee will review and refine this program in the coming months to include in the Notice of Intent and Stormwater Management Program Plan that they must each complete.

4. Began to define program of effective messaging on nutrients

Based on the 2014 draft Massachusetts Municipal Separate Storm Sewer Systems (MS4) permit, the 2016 final permit to be issued by the U.S. Environmental Protection Agency will have various education and outreach requirements for nutrients, specifically nitrogen and phosphorous. While there are four audiences noted under the permit, nutrient outreach and education is largely aimed at the residential, and business and institutional audiences. Note that the business and institutional audience includes private colleges, private schools, hospitals, and commercial facilities. Education and outreach topics relative to nutrients involve: lawn care activities, proper management of pet waste, and maintenance of septic systems.

There are additional education and outreach requirements depending on water quality issues:

- A. All Pioneer Valley stormwater regulated communities are subject to the *Long Island Sound Total Maximum Daily Load (TMDL) requirements for nitrogen* and must therefore supplement Residential and Business/Commercial/Institution programs with annual timed messages on specific topics:
- an annual message in the spring (April/May) timeframe that encourages the proper use and disposal of grass clippings and encourages the proper use of slow-release fertilizers;

- an annual message in the summer (June/July) timeframe encouraging the proper management of pet waste, including noting any existing ordinances where appropriate;³
- an annual message in the Fall (August/September/October) timeframe encouraging the proper disposal of leaf litter

“The permittee shall deliver an annual message on each of these topics, unless the permittee determines that one or more of these issues is not a significant contributor of nitrogen to discharges from the MS4 and the permittee retains documentation of this finding in the SWMP.”

B. Where water quality limited waterbodies are *impaired by phosphorus* (Belchertown, Easthampton, Granby, Southampton, Springfield, and Westfield), a municipality must supplement its Residential and Business/Commercial/Institution program with annual timed messages on specific topics:

- an annual message in the spring (March/April) timeframe that encourages the proper use and disposal of grass clippings and encourages the proper use of slow-release and phosphorous-free fertilizers
- an annual message in the summer (June/July) timeframe encouraging the proper management of pet waste, including noting any existing ordinances where appropriate
- an annual message in the fall (August/September/October) timeframe encouraging the proper disposal of leaf litter

“The permittee shall deliver an annual message on each of these topics, unless the permittee determines that one or more of these issues is not a significant contributor of phosphorous to discharges from the MS4 and the permittee retains documentation of this finding in the SWMP.”

Note that communities that are subject to a *lake or pond Total Maximum Daily Load (TMDL) requirements for phosphorus* (Granby, Hadley, Ludlow, Springfield, and Wilbraham) must develop a Lake Phosphorus Control Plan and within it describe both planned structural as well as non-structural controls. These non structural controls could include education and outreach, but based on the 2014 draft MS4 permit there does not seem to be anything specifically required on education and outreach within the permit term.

Education and outreach on nutrients

All 13 member communities of the Connecticut River Stormwater Committee will be subject to education and outreach requirements on nutrients. As such, the Connecticut River Stormwater Committee has been interested in understanding how to move forward with messaging under the new permit.

With funding from the Massachusetts Direct Local Technical Assistance Program and match from the Connecticut River Stormwater Committee budget, the Pioneer Valley Planning Commission worked to examine useful research and understand new regulations to provide direction for messaging on nutrients by the Committee.

New fertilizer use regulations in Massachusetts

Massachusetts has two sets of new regulations related to fertilizer use: one for non-agricultural turf and lawns and another for agricultural land. The new regulations for turf and lawns became effective June 5, 2015, and stipulate that phosphorous containing fertilizers may only be applied to turf and lawns when:

³ Annual messaging for pet waste is covered under the Bacteria section of this report.

1. a soil test indicates that it is needed; or
2. a lawn is being established, patched, or renovated.

This restriction mirrors laws already in place in Connecticut, Vermont, and New Jersey. Other highlights from the Massachusetts regulation prohibit nutrient applications between December 1 to March 1 or to saturated soil or soils that are frequently flooded. Professionals must keep records of nutrient applications. Retailers must display phosphorous containing fertilizer products separate from non-phosphorous fertilizer products and post a sign displaying language informing the consumer about phosphorous containing fertilizer restrictions for turf and lawns. For more detail, see language of regulation in Appendix E, and Massachusetts Department of Agricultural Resources (MDAR) Fact Sheet in Appendix F.

On December 5, 2015, regulations for the application of plant nutrients on agricultural lands became effective.

Existing Studies and Reports

In researching messaging around lawn care and nutrients, PVPC found critical guidance for the Connecticut River Stormwater Committee in a multi-year study (2006 to 2010) by the Land Grant Universities/Cooperative Extensions in New Hampshire, Vermont, Maine, Rhode Island, and Connecticut. Unfortunately, the cooperative extension at the University of Massachusetts did not participate in this study.

Focused on residential property owners, the study explores current understanding and behavior and messaging to change homeowner lawn care behavior to reduce nutrient loss in New England. PVPC could not find any studies focused on other types of property owners with lawns or even lawn care businesses or any specific explanation why the focus in this study on residential property owners.

Funded by the U.S. Department of Agriculture Cooperative State Research, Education, and Extension Service (USDA CSREES), the multi-year study had three major components:

- Part 1: Extensive social science survey on lawn care behavior in 5 New England communities (Hampden, ME; East Lyme, CT; Milton, NH; Brandon, VT; East Kingstown, RI) conducted to inform outreach design, development and implementation
- Part 2: Development and distribution of education and outreach materials guided by the social science survey findings
- Part 3: Follow up survey to understand effectiveness of project messaging in changing lawn care behavior

The program of this project was informed by the principles of community based social marketing. As defined by McKenzie-Mohr and Smith and mentioned above in the Bacteria section of this report, community based social marketing seeks to foster sustainable behavior by: identifying barriers and benefits to a sustainable behavior, designing a strategy that utilizes behavior change tools, piloting the strategy with a small segment of a community, and evaluating the impact of the program once it has been implemented across a community.

The central question to the USDA CSREES study is: What motivates environmentally responsible behavior in lawn care? Understanding the large answer to this question helped to inform design of a

specific outreach program aimed at measurable change in the practices of small-scale landowners in caring for their landscapes. Other objectives of the study included:

- Explore primary drivers of Do it Yourselfers (DIYers) lawn care choices and practices, especially with regard to fertilizer applications
- Investigate perceived barriers and benefits to adoption of more water quality friendly nutrient application practices
- Examine relative measures of trust and frequency of contact for various sources of yard care information by neighborhood residents
- Determine effectiveness of trained opinion leaders (such as Master Gardeners, local garden center staff, alpha neighbors, Extension staff, etc) to influence residential nutrient management behavior in neighborhoods

Results for part 1 of the program are included in a document entitled, "Changing Homeowner Lawn Care Behavior to Reduce Nutrient Losses in New England's Urbanizing Watersheds, Social Science Results Summary," 2008. This work entailed 52 in depth interviews in 5 communities with turf care opinion leaders from 4 categories:

- industry/business group
- outreach/educators group
- community/alpha neighbor group
- research/scientist group

In addition self-administered questionnaires were sent to residents in each of the 5 communities with the return of 754 completed questionnaires. See a summary of the key findings in Appendix G.

Note that for parts 2 and 3 of the program (the outreach phase), Maine, conducted and reported the work separately from the other project partners. As a result there are two different reports under part 3 of the program, one that covers Maine and another report that covers the communities in Maine, as well as Connecticut, New Hampshire, Vermont, and Rhode Island. Respectively, these reports are entitled as follows: "Changing Bangor Area Lawn Care Behavior: Results from the Evaluation Survey," 2008, and "Changing Homeowner Lawn Care Behavior to Reduce Nutrient Losses in New England's Urbanizing Watersheds, Final Social Science Project Evaluation Report," July 2010.

The 2010 study acknowledges, "...the study site in Maine was able to leverage the research from this project into a larger campaign than in other study communities..." In Maine, project partners followed up on the survey by testing messaging in six "...high amenity suburban communities with heavily managed lawns." They distributed messaging as follows: two neighborhoods received no messaging, serving as the control group; two neighborhoods received standard messaging about stormwater; and two neighborhoods received "normative" messaging (which aims to redefine the norm). Normative messaging picked up on indications from the USDA CSREES survey as well as previous studies that people feel it very important that their lawn fit in with their community and that community members adhere to community standards of lawn care (one researcher on the project referred to this as the "peer pressure" approach). So messages under this category were along the lines of, "Most of your neighbors don't apply chemicals to their lawns because they know that there is a better way to go in getting a healthy lawn."

Major Findings

While study findings within the USDA CEERES funded project agree that homeowners feel it very important that their lawn fit in with their community and that community members adhere to community standards of lawn care, study results also demonstrate that the standards of care and amount of fertilizers applied to lawns vary from neighborhood to neighborhood. In the first USDA CSREES survey of 5 communities across New England, the norm was not to apply fertilizers while in the Maine survey of the 6 "high amenity suburban neighborhoods," the norm is to apply fertilizers.

Also, while the project's first survey results indicate that there is a high level of awareness that lawn care practices may impact water quality, the Maine survey indicates that despite this understanding and concern, the perceived prevalence of chemicals used to maintain lawns in neighborhoods leads respondents to continue to apply chemicals to care for their lawns. Despite these issues, the Maine study did find that those who received normative messaging demonstrate a greater intention to reduce or eliminate fertilizer and pesticide use over those people who received standard messaging or no messaging at all.

What motivates lawn care choices and practices

The major driver for people seems to be a need to "fit in" by following the standards of lawn care they see in their neighborhood. At least one of the studies notes that this ideal of a desirable/healthy lawn is driven in large part by marketing, resulting in a type of lawn that demands high levels of input and intensive management strategies.

Most effective messaging

Based on the results coming out of the five-state New England study, it seems homeowners are aware that lawn chemicals can run off into waterways and negatively impact water quality. Homeowners also seem to understand the harmful impacts that lawn chemicals can have on children and pets. These connections between environment and health are important or very important to 77% of the respondents in the five-state USDA CEREEES funded survey. Along these lines, making connections to specific, local bodies of water draws on people's a sense of place as a motivator in environmentally responsible behaviors.

While health and water quality information should continue to be part of messaging, the Maine study indicates that messaging focused on shifting norms in lawn care will be most effective in facilitating behavior change. This norm-based appeal to environmental behavior change is far more effective than other framings.

Normative messaging aims to redefine what is a desirable lawn/healthy lawn and provides a means for DIYers to achieve a desirable and healthy lawn while adhering to environmentally sensitive strategy. According to the surveys from the study, what constitutes a "healthy lawn" is interpreted on a highly variable basis-not driven by research, but marketing. These influences seem to be resulting in lawns that demand high levels of input and intensive management strategies that could easily be interpreted as being unhealthy.

Other important approaches to effective messaging from or derived from the USDA CEREEES funded studies include:

- A component related to, "Don't use it all" or "Use only what needed" to address the tendency for people to use an entire package of fertilizer to avoid storage and thus overfertilize. New Hampshire Cooperative Extension is already considering development and distribution of a bag

clip that not only helps to make storage of leftover fertilizer a bit more convenient, but reminds people not to use it all.

- Messaging that plays up what appears to be common regard for lawns as providing recreational space (a functional, rather than appearance defined standard). Messaging from Paul Tukey's Safe Lawns campaign and his two books related to this campaign could be effective in this regard. It appears that the campaign organization itself is no longer operational, though the website is still up and running with tremendous information. See: Safelawns.org

Barriers to best practices

As mentioned above, the norms for lawn care within a given neighborhood and the desire for property owners to adhere to that standard present the biggest challenge in getting adoption of better practices.

Directions for more environmentally friendly practices of care must be more easily and readily available. The USDA CERES funded surveys found that people rely heavily on product packaging for application information. And the five-state survey found that University Extension and Master Gardeners are considered to be the most trustworthy sources of information.

It is important to note too that while people did not attach high importance to having a dark green lawn, clover free lawn, or golf-course quality lawn, they did feel that having a pest free lawn, having thick grass, and having a weed-free lawn are important.

While people in the 5-state survey do not seem averse to spending a little more time on their lawn (two-thirds of respondents indicated "no" or "no preference" to the question of whether they would prefer to spend less time managing their lawn than they currently do), they do feel that environmentally friendly lawn care practices will cost them more money. Good information on costs should be developed and distributed to help people understand the actual measure of this cost.

Making it easier for people to "do the right thing"

Points of purchase, where people are buying lawn care products and presumably looking for information on how to get desired results, presents great opportunity to help people do the right thing. Messaging and information could be provided in these locations through lawn care kiosks and workshops hosted by the local garden centers and hardware stores selling products in collaboration with some of the most trusted sources of information (as indicated by the New England survey): Cooperative Extension and Master Gardeners.

It is also critical to provide one reliable place to go for good information on homeowner lawn care practices. In Massachusetts, the new regulations refer people to the UMass Cooperative Extension for guidance. Guidelines for homeowners, however, are not immediately identifiable on the UMass website. Perhaps a great photo with a heading that says, "Your Lawn: What You Need to Know (click here)." While the new Massachusetts regulations focus on phosphorous, it will be important for people to also obtain information on nitrogen application, especially given that the Connecticut River basin contributes to water quality problems in Long Island Sound.

The USDA CERES funded project noted that recommendations from each the University of Connecticut and University Massachusetts Cooperative Extensions are somewhat contradictory from one another. Other cooperative extensions in New England appear to be using the recommendations coming from UConn, which might create some inconsistency with professionals who travel to other states to do lawn care.

At the same time, the New England Interstate Water Pollution Control Commission has devised a set of fertilizer guidelines for what it defines as “nonperformance turf”/“urban turf” based on four stakeholder meetings between 2012 and 2013. Stakeholders included turf fertilizer manufacturers, lawn care professionals, sports turf managers, turf industry trade groups and professional associations, researchers, university extension specialists, municipal and private groundskeepers, state and federal environmental agencies, and watershed groups. These are published in a report entitled, “Regional Clean Water Guidelines for Fertilization of Urban Turf.”

Since UMass Cooperative Extension is cited as the source for information in complying with new Massachusetts regulations, supporting UMass Cooperative Extension in developing and widely distributing concise and specific recommendations for best practices will be critical. Reconciling what may appear to be different recommendations coming from the NEIWPC and UConn's Cooperative Extension could be helpful too.

With the new requirements that soils be tested before applying phosphorous to a lawn, it will be important to sponsor soil test days. Interpreting results will be another important component of enabling people to comply with the new regulations as results may be confusing.

Messaging Going Forward

Discussion and key considerations

While the New England USDA CESREES project focused on homeowners, there are three additional audiences to which messaging about fertilizer use is important and required under the MS4 permit. These are: lawn care companies and commercial and institutional property owners with large lawns. Working with these other audiences to understand barriers and motivations to better practices will be important going forward in communities with such property owners. (Note that under the MS4 permit, reduced fertilizer use by cities and towns on landscapes at municipal parks, schools, and other properties is part of the municipal Minimum Control Measure on Good Housekeeping.) At the same time, UMass Extension has been working already with several of these audiences. It will be important to coordinate and integrate with the work UMass is already doing.

It is also critically important to get consistent fertilizer application recommendations together for both phosphorous and nitrogen. Though the new Massachusetts fertilizer regulations only explicitly curtail phosphorous use, nitrogen is a concern in the entire Connecticut River watershed based on water quality problems in Long Island Sound. For now, the MS4 permit has no specific restrictions on nitrogen in stormwater, but this may change going forward.

To be most effective, it will be useful to focus energy toward behavior change in neighborhoods where it is clear the standard of lawn care requires high inputs of fertilizers. Door hangers, a lawn sign campaign, and workshops at nearby garden centers or hardware stores are all ways to provide focus on a specific neighborhood. Target audiences might include condominium or neighborhood associations as well. It may also make sense to identify those neighborhoods with high inputs where there are existing water quality issues in nearby lakes or rivers.

Following are key considerations in nutrient messaging for homeowners based on the MS4 permit requirements, the new Massachusetts fertilizer use regulations, and findings from the USDA CESREES project:

- Use normative messaging wherever possible making group standards more apparent (e.g., 70% of your neighbors do not apply chemical fertilizers because they understand there are better ways to get the great lawn they want). People often decide what attitudes and actions are appropriate from those around them. This will take additional research in many cases in order to understand the norm in a given area.
- Redefine what is a desirable lawn and connect this to public health and water impacts/improvements. Also, be sure to name the Connecticut River or a local lake with which people identify.
- Provide good, clear instructions on best fertilizer practices and application rates when needed. Include distinction between slow release fertilizers and information on proper use of composts.
- Provide good, clear instructions on proper use/disposal of grass clippings in April/May and proper disposal of leaf litter in August/September/October
- Draw on sense of lawns as recreational space, a functional space to keep safe for people and pets
- Promote ways to not use all the fertilizer in a bag if not needed
- Partner with UMass Cooperative Extension and Western Massachusetts Master Gardeners wherever possible as the USDA survey indicates that residents caring for lawns seem to most trust cooperative extensions and master gardener organizations on lawn care issues

Next Steps

Based on survey results, PVPC has developed a draft program of messaging for Stormwater Committee communities on nutrients that includes metrics required under the forthcoming permit. This includes proposed formats and venues. The Stormwater Committee will review and refine this program in the coming months to include in the Notice of Intent and Stormwater Management Program Plan that they must each complete.

5. Discontinued collaboration with the Greenscapes Program www.Greenscapes.org

On behalf of Stormwater Committee members, PVPC has had lengthy conversations with Greenscapes partners to encourage the coalition to stay with a program of building understanding about the connection between better lawn and garden care practices and reduced impacts on water resources and human and environmental health. It seems especially important to stay with this specialized program given the new fertilizer regulations just enacted by Massachusetts. Despite PVPC's urging, however, coordinators of the Greenscapes program decided to leave this program of messaging and expand Greenscapes to address a broader program of stormwater information to more fully serve member communities in eastern Massachusetts.

6. Began retooling website education and outreach for the Pioneer Valley

Given the various websites/pages the Stormwater Committee communities have been using to promote work under the 2003 permit, including Think Blue and Greenscapes, and the expanded education and requirements of the forthcoming permit, PVPC has begun working to retool and update web materials. This has started with a newly proposed website framework under "Think Blue: Clean Water Begins with You," that attends to the various stormwater issues and audiences under the new permit. It will bring together education and outreach materials together with metrics for understanding the effectiveness of

messages and movement away from behavior and practices that negatively impact the health of the Connecticut River.

7. Led first phase of urban tree planting project in Chicopee, Holyoke, and Springfield

PVPC is leading an effort to promote urban tree planting in the region's 3 major cities in partnership with the US Forest Service, Massachusetts Executive Office of Energy and Environmental Affairs, the Valley Opportunity Council, Nuestras Raíces, ReGreen Springfield, Conway School of Design, Mass DCR, and the Cities of Chicopee, Holyoke, Springfield. Aimed at reducing stormwater flows to combined sewer areas and promoting greater climate resilience, the project involves an integrated community outreach process involving multiple neighborhood workshops and workshops for public works officials. The workshop for public works officials, held in November and conducted by engineering consultants TetraTech, drew 12 officials from 6 stormwater committee communities. The two neighborhood workshops held to date have each drawn some 40 participants. Once completed, the project will provide the following major deliverables:

- installation of 2,200 trees on local streets and yards
- final engineering design for a green streets in each municipality
- model stormwater tree rebate ordinance

The project is made possible thanks to a \$239,000 grant award to PVPC from the US Forest Service under the State and Private Forestry FY15 Northeastern Area Landscape Scale Restoration Program.

8. Collaborated with Massachusetts state-wide coalition of stormwater coalitions

On behalf of the Connecticut River Stormwater Committee, PVPC has been participating in a state wide conversation with other stormwater coalitions to determine how best to build efficiencies through collaboration for the forthcoming MS4 stormwater permit. The group, called together by a consultant and leader of the Central Mass coalition, has had two meetings to date in an effort to identify existing resources and explore possible collaborations on education and outreach. PVPC's hope is that the group can better identify all possible activities for collaboration under the permit by:

- clarifying who has produced tools and resources that can help in meeting permit requirements, perhaps with some updating
- where the gaps are in possible joint state-wide materials, and
- who would like to take responsibility for specific work going forward
