---

Just wanted to let you know that post our meeting, Chet and others at Apex attempted to tackle the herring/blasting question. Using the equations and the chart from the Blasting Effects Review Document, they were able to generate a lethality range. They had to make a number of assumptions, which Chet explained to me. Most of those assumptions are fairly to very conservative, so I think their calculation represents a worst case. They derived a lethality range about the same distance as the potential impact zone for sturgeon. Chet is preparing a memo explaining his work and will submit it to us for the record.
