1.0 INTRODUCTION

This report has been prepared on behalf of The Boeing Company (Boeing) as part of Duwamish Waterway sediment source control activities at the 107-acre Plant 2 facility (Figure 1). Plant 2 is located on East Marginal Way South in Seattle, Washington, with the southern portion extending into Tukwila, Washington. This report addresses sampling completed under the Revised Stormwater Source Control Work Plan (revised work plan) for Boeing Plant 2 (Golder and Floyd|Snider, 2007). The revised work plan was prepared and has been carried out in response to the Environmental Protection Agency's (EPA) May 26, 2006 request for an interim measure (IM), and in accordance with the 1994 Administrative Order on Consent (Order) No. 1092-01-22-3008(h) between Boeing and EPA Region X. The Order is issued pursuant to Section 3008(h) of the Solid Waste Disposal Act, also referred to as the Resource Conservation and Recovery Act (RCRA).

The west side of Plant 2 adjoins a section of the Lower Duwamish Waterway. Duwamish Waterway sediment in front of Plant 2 is being addressed as part of the Order, and is referred to as the Duwamish Sediment Other Area (DSOA). Cleanup of DSOA sediments will be performed under RCRA as an IM in a manner consistent with the corrective measure process under the Order.

As part of the sediment cleanup action, and within the context of a Duwamish-wide initiative, potential sources of contamination must be identified and demonstrated to be controlled. To this end, the objectives of stormwater source control are to 1) investigate and document the extent to which contaminants may be discharged from the Plant 2 storm system to the Duwamish Waterway via either water or suspended solids, and 2) initiate control actions necessary following the identification of any such contaminants and their source(s). The annual source control investigation consists of sampling of both stormwater and suspended solids in the stormwater from selected locations within the Plant 2 stormwater system, comparing analytical data to action levels, and identifying areas and methods for control actions, as necessary.

Boeing submitted the original Stormwater Source Control Work Plan (original work plan) (Golder and Floyd|Snider, 2006) to EPA on October 4, 2006 based on EPA's August 31, 2006 approval with modifications of the draft work plan. The first round (round 1) of source control sampling was conducted between October 18, 2006 and April 19, 2007. The round 1 results were presented in the Stormwater Source Control Round 1 Sampling Report (round 1 sampling report) (Golder, 2007) approved by EPA on October 15, 2007. Following completion of round 1, Boeing submitted the revised work plan, which was approved by EPA on January 15, 2008. The second round (round 2) of source control sampling began on October 2, 2007 and was completed on May 29, 2008. The round 2 results were presented in the Stormwater Source Control Round 2 Sampling Report (round 2 sampling report) (Golder, 2008a) approved by EPA (with modifications) on August 10, 2008.

The third round (round 3) of source control sampling began on November 11, 2008 and was completed on May 7, 2009. This report documents the round 3 sampling effort, presents the analytical results, and identifies response actions where necessary. Section 2 summarizes the overall source control investigation approach. Section 3 presents the field and analytical methodology for round 3 sampling. Section 4 summarizes the round 3 analytical results. Section 5 presents conclusions and identifies source control actions.

2.0 SUMMARY OF SOURCE CONTROL EVALUATION

The annual stormwater source control investigation was initiated in 2006 in response to elevated concentrations of polychlorinated biphenyls (PCBs) and metals detected in catch basin solids samples during a 2005 storm system survey (Tier 1/Tier 2 survey) (Floyd|Snider, 2005). Source control sampling is now conducted annually during the rainy season (October to May). Rounds 1 and 2 of source control sampling (2006-2007 and 2008-2009, respectively) have been completed and reported to EPA (Golder, 2007 and Golder, 2008a). Round 3 (2008-2009) began on November 11, 2008 and was completed on May 7, 2009.

The Plant 2 stormwater source control evaluation described in the original work plan consisted of sampling and analysis of suspended solids and/or water along 12 of the 24 active stormwater lines. EPA selected the stormwater lines to be sampled in a letter dated May 26, 2006 following discussions and a tour of the Plant 2 stormwater system. For some lines, both a suspended solids sample and a water sample were to be collected. For lines where building roofs are the sole source of drainage, only water samples were to be collected.

Selected stormwater lines that convey primarily roof drainage (D, G, L, M, O, S, V) were selected to undergo one-time water-only sampling. Stormwater lines A, B, I, J and Z had detectable concentrations of PCBs and/or metals within catch basin solids samples collected during the Tier 1/Tier 2 survey (Floyd|Snider, 2005). Locations along these five lines were identified for either contingent one-time (line A) or periodic (lines B, I, J, and Z) sampling for both suspended solids (using a filtration device) and water (passing through the filtration device). Along line J, two sampling locations were selected due to the line's split piping configuration before it discharges to the municipal roadway drainage system along 16th Avenue. During round 1, the line A sampling location was re-located from the outfall (2-449), identified in the original work plan, to an upgradient location (2-371) due to continuous tidal interference. This modification was documented in the revised work plan. The original work plan also identified action levels to which the data would be compared to assess the need for further source control measures.

Based on comparison of round 1 results to action levels, the round 1 sampling report identified sampling locations, media, and associated analyses for subsequent source control sampling, beginning with the 2007-2008 rainy season. During round 1, source control analytes were detected above action levels in samples from only two of the seven locations selected for one-time water-only sampling (lines G and V). As a result, during round 2, water-only samples were collected from only these two locations. Both suspended solids and water sampling were continued at all six of the round 1 sampling locations. As identified in the revised work plan, the planned analyses were also updated based on results from the first sampling round.

The round 2 results affirmed some round 1 exceedances of source control action levels for both PCBs and metals. To address these exceedances, in March 2008, Boeing submitted an IM work plan that identified source control actions to be completed during the summer of 2008 (Golder, 2008b). The IM work plan was submitted in May 2008 (approved by EPA in June) prior to submission of the round 2 data report (Golder, 2008a) to allow implementation of the control actions during the dry summer months. The IM was conducted during the summer and fall of 2008, and is described in the Interim Measure Completion Report - 2008 Stormwater Source Control Catch Basin Sampling and Storm Line Cleaning for Boeing Plant 2 (IM Completion Report) (Golder, 2008c). In general, the 2008 IM consisted of:

- Visually inspecting catch basins and collecting solids samples to assess potential entry points for PCBs and metals
- Cleaning catch basins and structures based on the analytical results and visual observations of accumulated solids
- Cleaning stormwater lines to remove legacy solids that may be ongoing sources of PCBs and metals detected during source control sampling
- Conducting a video survey of the stormwater lines to assess the integrity of the pipes and evaluate the cleaning
- Installing geotextile filter fabric inserts at selected stormwater system entry points to reduce the volume of solids entering the stormwater system

As part of this IM:

- 494 samples were collected from 364 locations
- 27,034 linear feet of stormwater line were cleaned, including 349 storm line segments and 12 channel drains/trench drains
- 417 structures were cleaned, including catch basins, inlets, manholes, pump basins, channel drain collection boxes, and oil/water separators
- 18,435 linear feet of stormwater line were inspected via video survey
- 261 new geotextile filter fabric inserts were installed at grated structures such as catch basins and inlets, and 26 existing fabric inserts were removed, cleaned, and re-installed at the remaining catch basins and inlets

The 2008-2009 round 3 source control investigation data presented in this report is evaluated relative to round 1 and 2 results to gauge the effectiveness of the summer 2008 IM, and determine whether additional mitigation actions are warranted.

3.0 2008-2009 SOURCE CONTROL SAMPLING

The 2008-2009 Plant 2 stormwater source control evaluation consisted of sampling and analysis of suspended solids and/or water along seven of the 24 active stormwater lines. Two lines that convey primarily roof drainage (G and V) were sampled for water only. The remaining five lines (A, B, I, J, and Z) were sampled for both suspended solids and water.

Table 1 lists the sampling locations by stormwater line. For each sampling location, the table provides the media, sampling frequency, and laboratory analyses performed. Figures 2a and 2b present the 2008-2009 source control sampling locations. Samples were collected in accordance with the sampling and analysis plan (SAP) provided as Attachment A of the revised work plan. The following sections describe source control sample collection and, where applicable, deviations from the procedures described in the revised work plan.

3.1 Suspended Solids and Associated Water Samples

The revised work plan identified six locations along five stormwater lines (A, B, I, J, and Z) for sampling of both suspended solids and water (Table 1). Two sampling locations were selected along line J due to the line's split piping configuration before it discharges to the municipal roadway drainage system along 16th Avenue.

A pump and filtration method is used to obtain suspended solids and associated water samples. At each location, an electric sump pump is lowered to the bottom of the vault. The pump is controlled by a float switch calibrated to activate at approximately eight inches of submergence, and to deactivate at a lower water level just above the pump intake. The pump is fastened to a length of PVC pipe, which is connected at ground surface to a 20-inch stainless steel filter housing containing a 5 micron polypropylene felt filter bag. A pressure gauge is mounted on the filter housing. A water sampling port and a flow totalizer are placed downstream of the filter bag. Discharge is routed via garden hose to either the downstream pipe exiting the manhole or to a downstream catch basin. A rain gauge is placed on the ground surface near the sampling apparatus to measure cumulative rainfall over the sampling period.

Pumping and filtration at the six locations was conducted between November 11, 2008 and May 7, 2009 using three identically-constructed sampling devices. A water sample was collected as soon as practicable following setup of each sampler. Water samples for metals analysis were filtered using a 0.45 µm field filter.

At each location, the sampler was deployed for several weeks to several months, depending on weather conditions, the construction of the basin, and other logistical considerations. After filtering several thousand gallons, the filter bag was removed from its housing and inspected for solids accumulation. If the solids material present appeared to be sufficient for the required laboratory analyses, sampling was completed, and the filter bag was packaged for transport the laboratory. Otherwise, the filter bag was returned to the housing for additional filtration.

Table 2 presents the sampling duration, cumulative rainfall, volume of stormwater filtered, and the suspended solids mass recovery at each of the six sampling locations. Field sample collection forms for suspended solids and associated water samples are provided in Attachment A. Locations 2-371 (line A) and 36-131 (line Z) are periodically tidally influenced; the bottom elevation of each is generally below the high tide level, but above the low tide level. For these locations, the pump is connected to a timer programmed to switch on during low tide periods only. Therefore, pumping and filtration at these locations is limited to rain events occurring while the tide elevation is below the vault bottom.

Water and filter bag samples were submitted to Analytical Resources, Inc. (ARI), of Tukwila, Washington, for analysis of metals, dissolved metals, and/or PCBs, as indicated in Table 1. Both metals and dissolved metals analyses comprised arsenic, cadmium, chromium, copper, lead, mercury, silver, and zinc, the eight constituents for which State of Washington Sediment Management Standards (Chapter 173-204 WAC) have been developed. As specified in the revised work plan, the lab was instructed to conduct metals analysis on only those filter bag samples where sufficient solids mass was recovered to remove a representative sample for analysis independent of the filter bag matrix.

During round 3, each filter bag sample submitted contained sufficient solids for metals analysis, with the exception of the line A sample. As identified in the revised work plan, the sample from location 2-371 (line A) requires analysis of metals only (PCBs were detected below the source control action level in the round 1 sample). However, during round 3, the filter bag sample collected from this location between February 27 and March 19, 2009 was inadvertently submitted for both metals and PCB analysis. The laboratory was unable to remove sufficient solid material for metals analysis, but the filter bag was extracted for PCB analysis, and the data is reported in Section 4. (Although not considered a deviation, this circumstance was communicated to EPA by email on April 23, 2009.) A second filter bag sample was collected from this location between March 27 and May 7, 2009 and submitted for analysis of metals only. For the remaining filter bag samples, following removal of the metals sample, the entire filter bag was extracted for PCB analysis.

3.2 Water-Only Samples

As indicated in Tables 1 and 2, water-only samples were collected from one outfall (line G) and one upgradient catch basin (along line V, where the outfall is inaccessible). Water-only samples were collected on January 6, 2009. Rain event information is provided in Table 2. Field sample collection forms for water-only samples are provided in Attachment A.

Outfall G is easily accessible and can be sampled by holding bottles directly in front of the pipe opening. The 2-44 gate valve manhole is sampled from ground surface using a peristaltic pump and dedicated tubing. A field duplicate sample was collected at this location. Both the sample and its duplicate were filtered using a 0.45 µm field filter. Water samples were submitted to ARI for analysis of SVOCs and dissolved metals, as identified in Table 1.

3.3 Decontamination and Field Quality Assurance

The pump and filtration apparatus used to collect the suspended solids and associated water samples was decontaminated between sampling locations. After each sampling event, the system was flushed with approximately 30 gallons of an Alconox-tap water solution, then rinsed with 15 to 20 gallons of tap water followed by 35 gallons of deionized water (supplied by ARI). Following decontamination, an equipment blank sample was collected from the deionized water pumped through the sampling train. Equipment blanks were analyzed for PCBs and dissolved metals. Equipment blank results are provided in Attachment B.

Sampling material associated with the water-only samples was dedicated, single-use equipment and did not require decontamination.

This page intentionally left blank

4.0 2008-2009 SOURCE CONTROL SAMPLING RESULTS

Samples were analyzed by ARI in accordance with the SAP provided as Attachment A of the revised work plan. The following sections describe the analytical methodology and summarize the analytical results. Analytical results are presented in Tables 3 through 5. Laboratory summary data packages are provided in Attachment B. Table B-1 lists the source control samples by stormwater line, media, and laboratory data package. Data validation results are provided in Attachment C.

4.1 Analytical Methodology and Data Conversion

The revised work plan specified that for round 2 and subsequent rounds, metals analysis is to be conducted on only those filter bag samples containing sufficient solids mass to remove a representative sample from the filter bag for analysis. This method eliminates the potential for metals contamination that was identified during round 1 based on detections of zinc in samples of unused filter fabric. The minimum amount of material that can be digested and analyzed for metals is limited by the analytical method to approximately 1 gram. For solids samples analyzed for both metals and PCBs, after the metals sample was removed the filter bag was dried, weighed, and extracted for PCB analysis.

Metals results were reported as a concentration in mg/kg-dry solids. PCB results were reported as total μg per sample. For comparison to source control action levels, the PCB result reported by the laboratory was adjusted to an estimated concentration in terms of analyte mass per dry solids weight. To facilitate this conversion, filter bags were pre-weighed by ARI. Analytical results were converted to $\mu\text{g}/\text{kg}$ -dry solids based on the difference between the initial and final dry weight of the filter bag. Filter bag initial and final weights and the data conversion equation are presented in Table 3.

4.2 Analytical Results for Suspended Solids and Associated Water Samples

Table 4 presents analytical results for suspended solids samples from rounds 1 through 3. Table 4 presents the PCB data converted to estimated concentrations in $\mu\text{g}/\text{kg}$ -dry solids, as described in Section 4.1. As noted in Section 3.1, during round 3, a line A sample was incorrectly analyzed for PCBs. The estimated total PCB concentration from this location was 244 $\mu\text{g}/\text{kg}$, below both the source control action level and the round 1 result (416 $\mu\text{g}/\text{kg}$). In addition, upon receipt of the line B filter bag sample data, it was noted that the wet and dry weights recorded for the sample indicated an anomalously low water loss percentage upon drying. ARI was not able to reproduce the measurement (the filter bag was consumed during analysis) or provide further documentation; however, after conducting an evaluation of water lost by the other round 3 samples during drying, ARI concluded that the original value reported was indeed an error, and submitted a letter and spreadsheet as documentation (ARI, 2009). The correction made by ARI results in a PCB concentration that is both more conservative (1,137 $\mu\text{g}/\text{kg}$ vs. 0.15 $\mu\text{g}/\text{kg}$) and consistent with previous results for this line. ARI's letter and spreadsheet have been appended to the data package (ARI sample delivery group OY07)

provided as part of Attachment B of this report, and the correction has been noted in the data validation report (Attachment C).

PCBs were detected in all six round 3 suspended solids samples in which they were analyzed, with estimated concentrations exceeding the source control action level (1,000 µg/kg-solids) in four of the six samples (lines B, I, and J [18-249 and 18-505A]). Estimated concentrations above the action level ranged from 1,090 µg/kg to 2,705 µg/kg. PCBs were detected below the source control action level in the solids sample from 36-131 (line Z), at an estimated concentration of 947 µg/kg.

During round 2, six metals (cadmium, chromium, copper, lead, mercury, and zinc) were detected above action levels in suspended solids samples; only four metals (cadmium, chromium, copper, and zinc) exceeded action levels in round 3 suspended solids samples. There were no action level exceedances for metals in the line I and line Z round 3 suspended solids samples. The samples from line B and location 18-249 on line J had the most metals exceedances during round 3, both with three metals detected above action levels.

Table 5 presents analytical results from rounds 1 through 3 for detected constituents in water samples from suspended solids and water sampling locations. (Constituents, such as dissolved mercury, that were detected below action levels during round 1 and not detected in rounds 2 and 3 are not included in Table 5.) Dissolved arsenic, copper, and zinc were detected in round 3 water samples. Both dissolved copper and zinc exceeded action levels in the sample from location 18-505A along line J. Dissolved copper exceeded the action level in the water samples from line B and the second line J location (18-249). Dissolved zinc exceeded the action level in the line A water sample. There were no action level exceedances among the round 3 water sample results for lines I and Z.

4.3 Analytical Results for Water-Only Samples

Table 5 presents analytical results for detected constituents in water samples from water-only sampling locations (lines G and V) for rounds 1 through 3. The water sample from outfall G was analyzed for SVOCs only. Bis(2-ethylhexyl)phthalate was detected slightly above its source control action level (2.2 µg/L) at 2.4 µg/L, and phenanthrene, for which no source control action level has been developed, was detected at 0.12 µg/L. The water sample and duplicate from line V were analyzed for dissolved metals only. Dissolved copper was detected above the source control action level (3.1 µg/L) in the primary sample (4 µg/L), but below the action level in the duplicate (3 µg/L). Dissolved zinc was detected above the action level (81 µg/L) in both the primary and duplicate samples at 230 µg/L (both samples). Arsenic was detected below the action level in both samples.

5.0 CONCLUSIONS AND SOURCE CONTROL ACTIONS

In general, round 3 suspended solids data demonstrate an improvement from rounds 1 and 2, but indicate that PCBs and metals remain variably present in Plant 2 stormwater solids at concentrations above their respective action levels. Round 3 dissolved copper and zinc results for source control water samples are generally consistent with the results of the quarterly stormwater quality sampling conducted under the Plant 2 NPDES permit.

Ongoing source control sampling is discussed in Section 5.1. Section 5.1.1 identifies the criteria used annually, beginning with evaluation of the round 2 data, to identify the sampling matrix for the following round. Section 5.1.2 applies these criteria to round 3 results and presents the round 4 (2009-2010) sampling matrix. Round 3 results are evaluated with respect to the 2008 source control IM (Golder, 2008c) in Section 5.2. Section 5.3 presents the schedule for source control actions identified in Section 5.2, as well as for round 4 (2009-2010) source control sampling.

5.1 Ongoing Source Control Sampling

As described in Section 2, the Plant 2 stormwater source control evaluation specified in the original work plan consisted of sampling and analysis of suspended solids and/or water along 12 of the 24 active stormwater lines. Selected stormwater lines (D, G, L, M, O, S, V) were identified for contingent one-time (based on comparison of results to action levels) water-only sampling. Stormwater lines A, B, I, J and Z were identified for either contingent one-time (line A) or periodic (lines B, I, J, and Z) sampling for both suspended solids and water.

Based on rounds 1 results, line A (originally identified for one-time sampling) was designated for continued sampling of both suspended solids and water for metals analysis during round 2 and subsequent rounds. Among the seven locations originally selected for one-time water-only sampling, only two (lines G and V) were reported with source control analytes above action levels during round 1. As a result, during rounds 2 and 3, water-only samples were collected from only these two locations. Also during round 3, the four lines originally identified for periodic sampling of suspended solids and water (B, I, J, and Z) were re-sampled due to action level exceedances during rounds 1 and 2.

The round 3 data is similarly evaluated to define the source control investigation for the following year. Section 5.2.1 identifies the criteria established in the round 2 report to identify sampling to be conducted during the next round. Section 5.2.2 evaluates the round 3 results based on these criteria and identifies the round 4 sampling matrix.

5.1.1 Source Control Sampling Matrix Evaluation Criteria

As identified in the round 2 sampling report (Golder, 2008a), the following criteria are applied annually at each location to identify: 1) whether sampling will be continued during the next round, 2) media to be sampled, and 3) analyses to be performed.

- Location originally designated for one-time sampling of suspended solids and water (line A) – Given action level exceedances for metals, both media will continue to be

sampled for metals until three consecutive rounds are completed without action level exceedances.

- Locations originally designated for periodic sampling of suspended solids and water (lines B, I, J, and Z) – Given action level exceedances for PCBs and metals, sampling will continue for both suspended solids (PCBs and metals) and water (dissolved metals) until three consecutive rounds are completed without action level exceedances.
- Locations originally designated for one-time water only sampling (lines G and V) – Sampling and analysis of the target analyte group (i.e., SVOCs and dissolved metals, respectively) will continue until three consecutive rounds of sampling are completed without action level exceedances.

Sampling beyond durations indicated here for source control purposes will be evaluated for long term source monitoring objectives following completion of the DSOA dredging project.

5.1.2 Summary of 2008-2009 Results and Proposed 2009-2010 Sampling

The fourth round of source control sampling will be conducted during the 2009-2010 rainy season. The source control sampling matrix for 2009-2010 is presented in Table 6. Figures 2a and 2b present the 2008-2009 sampling locations and Figures 3a and 3b present the 2009-2010 sampling locations.

As identified in Section 2, the original work plan prescribed one-time sampling for location 2-449 along line A. However, due to tidal interference, an alternate upgradient location (2-371) was sampled. During round 1, PCBs were detected below the action level in suspended solids from this location (Table 4), and were subsequently eliminated from consideration at line A. Metals, however, were detected above action levels in both the solids and water samples. Therefore, during round 2, both suspended solids and water from this location were sampled for analysis of metals only. A suspended solids sample from this location was inadvertently submitted for PCB analysis during round 3. PCBs were detected below the action level in this sample. Cadmium and zinc concentrations in suspended solids exceeded action levels in a second sample collected for metals analysis. Dissolved zinc was also detected above the action level in the water sample. Sampling of suspended solids and water for metals analysis only will therefore be continued at this location during round 4.

At line B (3-307), originally designated for periodic sampling, total PCBs in the round 1 and 2 suspended solids samples exceeded the source control action level at 2,407 and 1,333 $\mu\text{g}/\text{kg}$, respectively. Total PCBs were again detected above the action level, at 1,137 $\mu\text{g}/\text{kg}$, in the round 3 suspended solids sample; however, the concentration in this sample, collected following completion of the source control IM, was lower than in both of the two previous years. Cadmium, lead, and zinc were detected above action levels in suspended solids during rounds 1 and 2, while cadmium, chromium, and zinc exceeded action levels in suspended solids during round 3. Except for cadmium and chromium, metals concentrations in line B suspended solids decreased between rounds 2 and 3. Dissolved copper and zinc were detected above action levels in round 1 and 2 water samples; only dissolved copper exceeded the action level during

round 3. Both suspended solids (metals and PCBs) and water (dissolved metals) will be re-sampled at 3-307 during round 4.

At line I (4-283), originally designated for periodic sampling, total PCBs in the round 1 and 2 suspended solids samples exceeded the source control action level at 5,429 and 6,177 µg/kg, respectively. Total PCBs were detected above the action level in the round 3 sample collected following completion of the source control IM, but at a significantly lower estimated concentration, 1,447 µg/kg. Metals data were not obtained for suspended solids during round 1 due to insufficient solids retention in the filter bag. During round 2, five metals were detected above action levels in suspended solids. During round 3, following completion of the 2008 source control IM, there were no metals exceedances in line I suspended solids. Metals concentrations in water samples from all three rounds were below action levels. Suspended solids (metals and PCBs) will be re-sampled at 4-283 during round 4; however, based on the criteria in Section 5.2.1, water sampling at this location will be discontinued beginning with round 4.

At line J (18-249), originally designated for periodic sampling, total PCBs in round 1 and 2 suspended solids samples exceeded the source control action level at 6,444 and 2,100 µg/kg, respectively. Total PCBs were also detected above the action level, at 2,705 µg/kg, in the round 3 sample. Metals data were not obtained for suspended solids during round 1 due to insufficient solids retention in the filter bag. During round 2, cadmium, copper, mercury, and zinc were detected above action levels in suspended solids. Cadmium, copper and zinc were detected above action levels in round 3 suspended solids. Dissolved copper and zinc were detected above action levels in the water sample from round 2; only dissolved copper exceeded the action level in the round 3 water sample. Both suspended solids (metals and PCBs) and water (dissolved metals) will be re-sampled at 18-249 during round 4.

Line J catch basin 18-505A was originally identified for periodic sampling. Sufficient suspended solids were not recovered from this location during round 1, but samples were successfully collected during rounds 2 and 3. PCBs were detected below the action level in the round 2 suspended solids sample and above the action level in the round 3 sample, at 658 and 1,090 µg/kg, respectively. Copper and zinc were detected above action levels in both rounds of suspended solids samples; round 3 levels of all metals were slightly lower. Copper and zinc were detected above action levels in all three rounds of water samples from this location. Sampling of both suspended solids (metals and PCBs) and water (dissolved metals) will be continued at 18-505A during round 4.

At line Z (36-131), total PCBs in the round 1 and 2 suspended solids samples exceeded the source control action level at 1,875 and 1,426 µg/kg, respectively. Total PCBs were detected below the action level, at 947 µg/kg, in the round 3 sample collected following completion of the source control IM. Metals data were not obtained for suspended solids during round 1 due to insufficient solids retention in the filter bag. During round 2, chromium was detected above its action level in the suspended solids sample. There were no metals exceedances in line Z suspended solids during round 3. Dissolved copper was detected above the action level in the

water sample from round 1; there were no action level exceedances in water samples from rounds 2 and 3. Both suspended solids (metals and PCBs) and water (dissolved metals) will be re-sampled at 36-131 during round 4.

Outfall G was originally selected for one-time water-only sampling of SVOCs. However, chrysene was detected above the action level in the round 1 sample from outfall G; accordingly, this location was re-sampled for SVOCs during round 2. Chrysene was not detected during rounds 2 and 3; however bis(2-ethylhexyl)phthalate was detected slightly above the action level during round 3. Outfall G will be re-sampled for SVOCs during round 4 based on the criteria identified in Section 5.2.1. Similarly, the 2-44 gate valve along line V was originally selected for one-time water-only sampling. Dissolved copper and zinc were detected above action levels during rounds 1 and 3; dissolved copper only was detected above the source control action level during round 2. This location will be re-sampled for dissolved metals during round 4.

5.2 Additional Source Control Actions

As described in Section 2, to address action level exceedances from round 1 and round 2 results, Boeing completed the 2008 source control IM during the summer and fall of 2008, as described in the IM Completion Report (Golder, 2008c). Source control actions performed under the IM work plan consisted of:

- Catch basin solids sampling from selected locations for analysis of PCBs and metals
- Cleaning of selected catch basins
- Cleaning of selected storm lines via pipe jetting
- Placement of filter fabric catch basin inserts at selected storm system entry points based on catch basin sampling results

In general, the IM removed legacy residual solids material from the stormwater system that may have been a source of PCBs and metals detected during the first two rounds of stormwater source control sampling, and implemented controls to reduce future solids accumulation in the system. During round 3, following completion of the IM, total PCB concentrations were below previous levels at four of the six locations where they were analyzed, and were below the action level for the first time at line Z. Round 3 source control investigation data indicates that, following completion of the IM, action level exceedances remain to be addressed for PCBs at lines B, I, and J; for metals at lines A, B, and J; and for SVOCs and metals at lines G and V, respectively. Of these lines, only G and V were not addressed by the 2008 source control IM.

To address source control exceedances at lines A (metals), B (PCBs and metals), G (SVOCs), I (PCBs), J (PCBs and metals), and V (metals), Boeing will initiate an analysis to identify sources upgradient of each sampling location. The analysis will incorporate catch basin data gathered during the 2008 source control IM and other information about operational uses in each drainage area. A source control action work plan identifying additional data required for this analysis and presenting sample collection procedures will be submitted for this next phase of

source control work. Field work to obtain any additional data will be conducted in conjunction with round 4 sampling if timely approval is received.

In addition to continued source analysis, specific to line B, the 2008 catch basin data (Golder, 2008c) indicated the presence of elevated PCB concentrations in catch basins within the Jet-A fuel tank containment area. In 2006, prior to reactivation of one of the tanks, Boeing removed PCB-containing materials from the concrete containment surfaces in this area (Boeing, 2006). Residual particles of the removed material may be an ongoing source of PCBs and metals detected in the stormwater: although the catch basins within the containment area are fitted with both metal and filter fabric inserts, the area is inaccessible to sweeper trucks and has not been routinely swept as part of Plant 2 stormwater best management practices. Therefore, during the summer/fall of 2009, prior to initiation of the source identification analysis, Boeing will identify a method to thoroughly vacuum and/or sweep the pavement in this area. This work will be documented in the round 4 report, and round 4 (2009-2010) source control results will be used to evaluate its effectiveness.

The drainage areas for lines I and J include three areas in which, pending EPA approval of the draft work plan, Boeing will remove caulk manufactured with PCB concentrations greater than 25 ppm from concrete pavements as part of the Phase 3 Interim Measure Work Plan - Removal of PCB-Containing Caulk in Concrete Pavements (Golder, 2009). Two of the planned caulk removal areas are within the line I drainage, east of Building 2-15 and south of Building 2-10, and one of the removal areas is within the line J drainage, under the South Park Bridge. Caulking material in these areas may be an ongoing source of PCBs to lines I and J. If EPA approval is not obtained in time to complete all caulk removals in 2009, results of line I and J area removals will be assessed as part of round 5 source control sampling. More extensive source control action will be planned in conjunction with King County's replacement of the South Park Bridge, which will affect lines I and J drainages. King County has not yet scheduled its multi-year bridge replacement construction work.

Finally, Boeing is planning a number of construction activities that will impact stormwater at Plant 2, including extensive site redevelopment to take place over the next several years. This work will include redesign of the stormwater system. Boeing will submit a work plan summarizing these activities, including proposed designs and timelines, and identifying which project(s) are expected to address stormwater at each of storm lines A, B, I, J, V, and Z.

5.3 Scheduling

A work plan for the source identification analysis described in Section 5.3 will be submitted perhaps prior to EPA's approval of this report given Boeing's desire to be timely with this next phase of source control work. Sweeping and/or vacuuming within the line B containment area will be carried out prior to commencement of round 4 source control sampling as part of Best Management Practices work. The fourth round of source control sampling as defined in the 2009-2010 sampling matrix (Table 6) will begin in October 2009 and continue until sufficient sample material has been collected at all sampling locations or until the end of the rainy season

Stormwater Source Control Round 3 Sampling Report
Boeing Plant 2

(April to May, 2010). Boeing will submit a work plan summarizing the Plant 2 construction activities affecting stormwater, including site redevelopment and stormwater system replacement, by May 27, 2010.

2008-2009 Sampling Matrix

Stormwater Source Control Round 3 Sampling Report
Boeing Plant 2

Stormwater Line	Sampling Location	Suspended Solids Analyses Performed	Water Analyses Performed	Planned Sampling Frequency ¹
A	2-371 ²	SMS metals ³ PCBs ⁴	SMS metals (dissolved) ⁵	one time
B	3-307	PCBs SMS metals	SMS metals (dissolved)	PCBs & metals periodically
G	discharge	NA	SVOCs	one time
I	4-283	PCBs SMS metals	SMS metals (dissolved)	PCBs & metals periodically
J	18-249, 18-505	PCBs SMS metals	SMS metals (dissolved)	PCBs & metals periodically
V	2-44 gate valve	NA	SMS metals (dissolved)	one time
Z	36-131	PCBs SMS metals	SMS metals (dissolved)	PCBs & metals periodically

Notes:

- "One time" denotes locations that were originally designated for contingent one-time sampling in 2006 where, based on round 1 results, sampling was continued during round 2.
 - 2-449, the location immediately upgradient of the outfall was originally selected for sampling. Due to continuous tidal interference, 2-371 was selected as a replacement (Golder and Floyd|Snider, 2007).
 - SMS metals comprise the eight metals (arsenic, cadmium, chromium, copper, lead, mercury, silver, zinc) for which State of Washington Sediment Management Standards (Chapter 173-204 WAC) have been adopted.
 - Although PCBs were not part of the line A sampling matrix specified in the round 2 report, the suspended solids sample from this location was inadvertently submitted for PCB analysis.
 - Water samples for metals analysis are field-filtered using a 0.45 micron filter.
- NA - Not analyzed or not applicable

Notes:

- Line A sample initially submitted March 19; filter bag contained insufficient solids for metals analysis. Location was re-sampled March 27 - May 7.
- Filter was found clogged at this location on 2/12, prior to water sample collection. First filter bag was submitted to laboratory on 2/12 for analysis of PCBs and metals. Filter bag was replaced with a clean bag on 2/12 through which a water sample was collected on 2/23.
- Flowmeter found malfunctioning mid-way through sampling period. Actual value is likely greater.
- Rain gauge found broken mid-way through sampling period. Replaced on 4/17.
- NA - Not analyzed or not applicable.

Z	36-131	PCBs SMS metals ¹	SMS metals (dissolved)

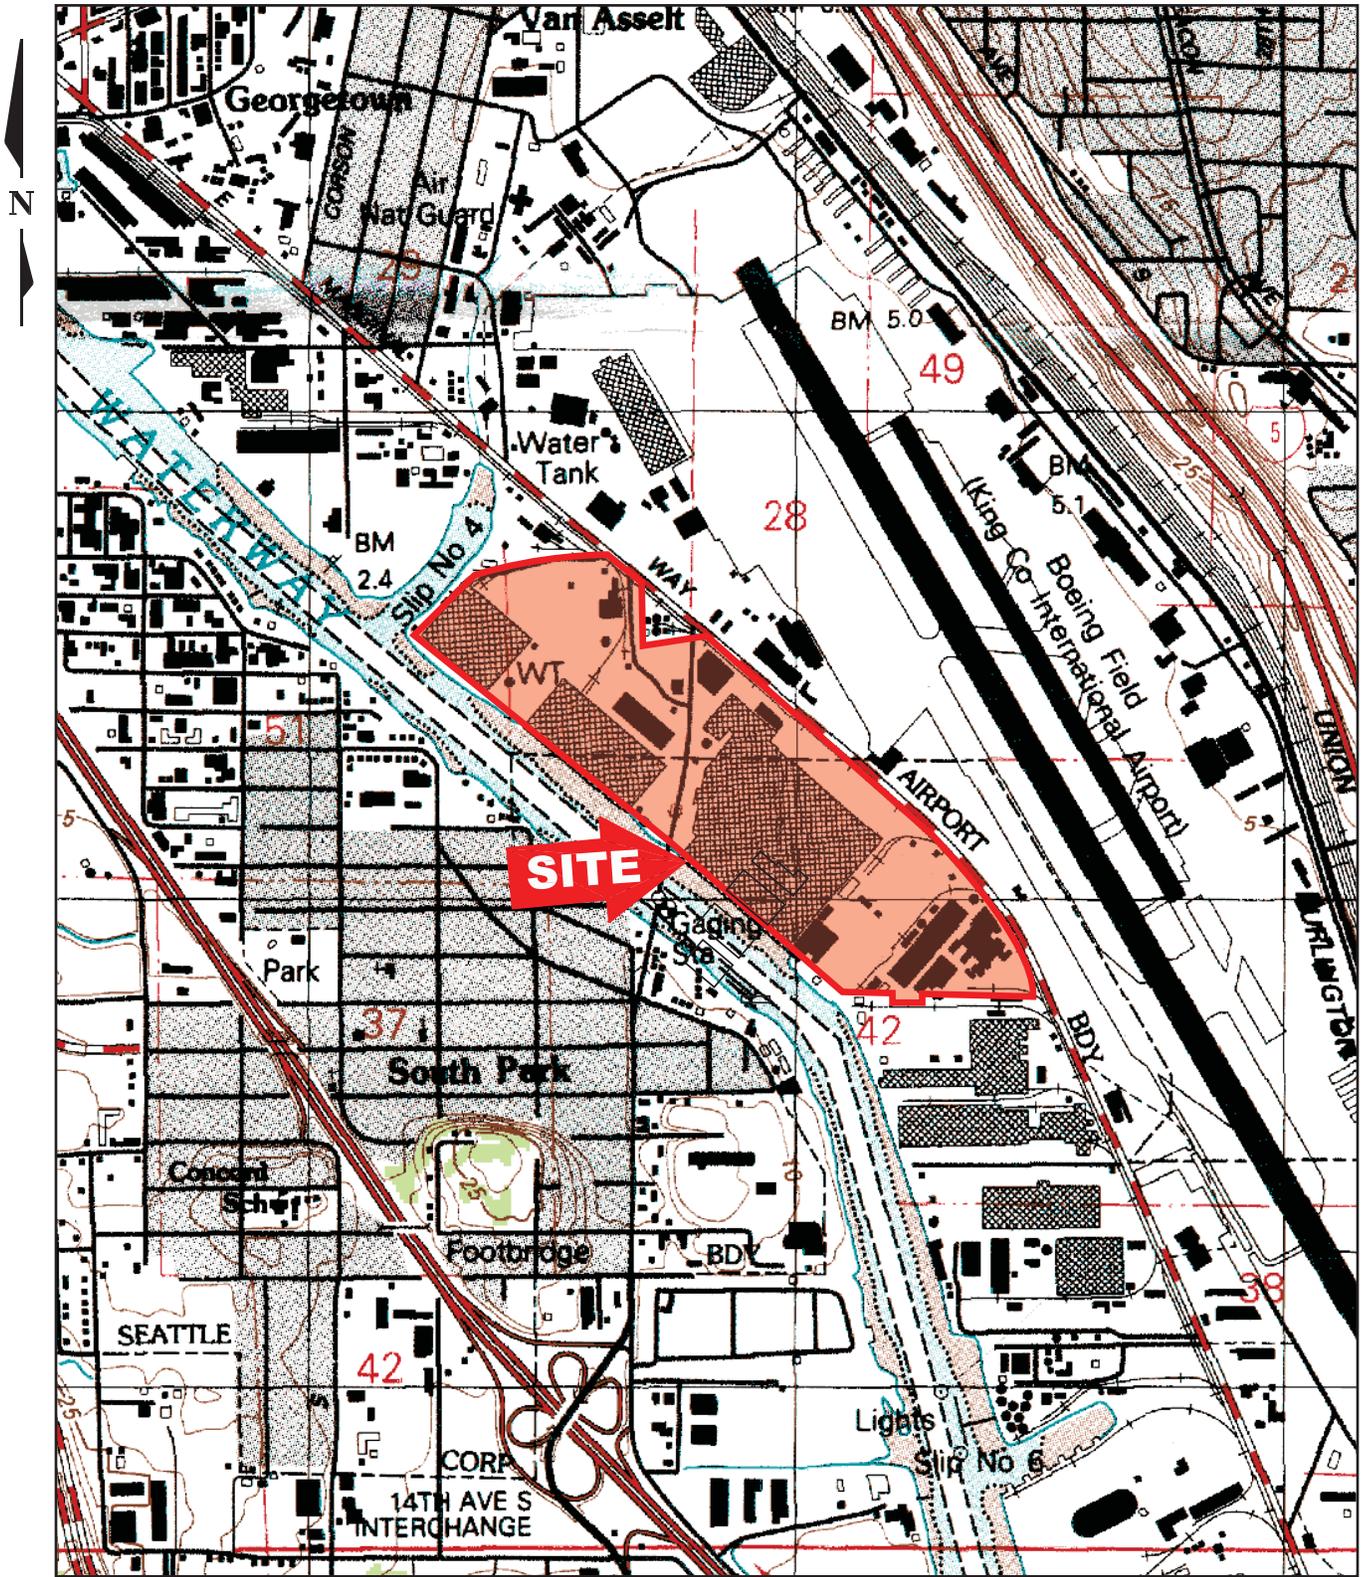

Notes:

1. Metals analysis for suspended solids samples will be contingent upon adequate solids mass recovery.
2. Water samples for metals analysis are field-filtered using a 0.45 micron filter.
3. SMS -State of Washington Sediment Management Standards (Chapter 173-204 WAC)
4. NS -Not sampled

<u>1L HDPE / HNO3</u>	<u>1</u>	<u>SMS Metals</u>	<u>Y</u>	
<u>1L HDPE / HNO3</u>	<u>1</u>	<u>LLHg</u>	<u>Y</u>	

Suspended Solids Samples

	<u>FB-031</u>	<u>FB-032</u>	
Filtration Start Date:	<u>2/27/09</u>	<u>3/27/09</u>	# Filter Bags Collected: <u>2</u>
Filtration End Date:	<u>3/19/09</u>	<u>5/7/09</u>	Filter Bag #: <u>FB-031</u> <u>FB-032</u>
Total Volume Filtered:	<u>3114 gal</u>	<u>14,503.7 gal</u>	Initial Dry Weight: <u>97.97g</u> <u>103.92g</u>

Sampler #1

2/27 - Set up. Tidally influenced. Timer set for pump to engage when tide level < 8.4 ft

3/19 - Filter bag appears clogged. Collected PL25C-SS-A-031909

3/27 - Re-set up sampler #1 to collect filter bag sample for metals only (3/19 sample did not contain enough volume for metals)
FB-032: Initial Flow = 49547.2 gal

5/7 - Collected PL25C-SS-A-050709

* Rain gauge found broken midway through sampling period - replaced on 4/17. Readings from two rain gauges were 61.2mm and 64.4mm. Reading #1 is probably biased low, as rain gauge was broken, and possibly knocked over.

Total Volume Filtered: <u>1088.8</u>	Initial Dry Weight: <u>100.4 g</u>

Sampler #1

2/10 - Pump running, but no flow emerging from discharge hose or sampling port. Pressure = 10psi. Filter likely clogged.

* 2/12 - Pump not running - water level below intake. Inspected filter bag - appears clogged.
 Collected PL25C-SS-J249-021209
 Replaced filter bag with FB-029 (Have not yet collected water sample). Will return and sample water through second filter bag.

2/23 - Collected PL25C-W-J249-022309

2/27 - Broke down sampler. Delivered second filter bag to lab for hold.

RE: Boeing Plant 2 Source Control
ARI ID: NZ46 and NZ56

Dear Will:

Please find enclosed the original *Chain of Custody* (COC) record and final data package for the project referenced above.

Sample receipt information and analytical details are addressed in the *Case Narrative*.

Copies of the reports and all associated raw data will be kept on file at ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,
ANALYTICAL RESOURCES, INC.

A handwritten signature in black ink, appearing to read "Kelly Bottem".

COC No: _____
Assigned ARI Job No: NZ46

Project Name: _____
Delivered by: Hand
Tracking No: _____

Preliminary Examination Phase:

- Were intact, properly signed and dated custody seals attached to the outside of to cooler? YES NO
- Were custody papers included with the cooler? YES NO
- Were custody papers properly filled out (ink, signed, etc.) YES NO
- Record cooler temperature (recommended 2.0-6.0 °C for chemistry) 2.2 °C

Cooler Accepted by: MM Date: 11/11/08 Time: 1445

Complete custody forms and attach all shipping documents

Log-In Phase:

- Was a temperature blank included in the cooler? YES NO
- What kind of packing material was used? ice
- Was sufficient ice used (if appropriate)? YES NO
- Were all bottles sealed in individual plastic bags? YES NO
- Did all bottle arrive in good condition (unbroken)? YES NO
- Were all bottle labels complete and legible? YES NO
- Did all bottle labels and tags agree with custody papers? YES NO
- Were all bottles used correct for the requested analyses? YES NO
- Do any of the analyses (bottles) require preservation? (attach preservation checklist) YES NO
- Were all VOC vials free of air bubbles? NA YES NO
- Was sufficient amount of sample sent in each bottle? YES NO

Case Narrative

Project: Boeing Plant 2 Source Control

ARI ID: NZ46 and NZ56

Matrix: Water

Date: November 28, 2008

Sample Receipt Information

Two water samples were received in good condition at ARI on 11/11/08 under ARI sample delivery groups NZ46 and NZ56. One cooler arrived at a temperature of 2.2°C.

PCBs by Method 8082:

The samples were extracted on 11/14/08 and analyzed on 11/20/08 within the method recommended holding times.

Initial calibration (s): All analytes of interest were within method acceptance criteria.

Continuing calibration (s): Are in control.

Samples: There were no anomalies associated with these samples.

Surrogates: The method blank surrogate TCMX is out of control low. All other surrogate recoveries were in control; therefore no further corrective action was taken.

LCS(s): All percent recoveries for the analytes of interest were within compliance.

Method Blank: The method blank was free of contamination.

Total Metals by Methods 6010B and 7000 series

The samples were digested on between 11/17/08 and 11/18/08. The digests were analyzed between 11/19/08 and 11/24/08 within the method recommended holding times.

Replicate(s): All percent recoveries were within compliance.

Samples: No anomalies were encountered for these samples.

LCS/Blank Spike(s): All percent recoveries were within compliance.

Method Blank(s): Are in control.

Standard Reference: All percent recoveries were within compliance.

Data Reporting Qualifiers

Effective 12/28/04

Inorganic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Duplicate RPD is not within established control limits
- B Reported value is less than the CRDL but \geq the Reporting Limit
- N Matrix Spike recovery not within established control limits
- NA Not Applicable, analyte not spiked
- H The natural concentration of the spiked element is so much greater than the concentration spiked that an accurate determination of spike recovery is not possible
- L Analyte concentration is ≤ 5 times the Reporting Limit and the replicate control limit defaults to ± 1 RL instead of the normal 20% RPD

Organic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Flagged value is not within established control limits
- B Analyte detected in an associated Method Blank at a concentration greater than one-half of ARI's Reporting Limit or 5% of the regulatory limit or 5% of the analyte concentration in the sample.
- J Estimated concentration when the value is less than ARI's established reporting limits
- D The spiked compound was not detected due to sample extract dilution
- NR Spiked compound recovery is not reported due to chromatographic interference
- E Estimated concentration calculated for an analyte response above the valid instrument calibration range. A dilution is required to obtain an accurate quantification of the analyte.
- S Indicates an analyte response that has saturated the detector. The calculated concentration is not valid; a dilution is required to obtain valid quantification of the analyte
- NA The flagged analyte was not analyzed for
- NS The flagged analyte was not spiked into the sample

- M Estimated value for an analyte detected and confirmed by an analyst but with low spectral match parameters. This flag is used only for GC-MS analyses
- M2 The sample contains PCB congeners that do not match any standard Aroclor pattern. The PCBs are identified and quantified as the Aroclor whose pattern most closely matches that of the sample. The reported value is an estimate.
- N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification"
- Y The analyte is not detected at or above the reported concentration. The reporting limit is raised due to chromatographic interference. The Y flag is equivalent to the U flag with a raised reporting limit.
- C The analyte was positively identified on only one of two chromatographic columns. Chromatographic interference prevented a positive identification on the second column
- P The analyte was detected on both chromatographic columns but the quantified values differ by $\geq 40\%$ RPD with no obvious chromatographic interference

Geotechnical Data

- A The total of all fines fractions. This flag is used to report total fines when only sieve analysis is requested and balances total grain size with sample weight.
- F Samples were frozen prior to particle size determination
- SM Sample matrix was not appropriate for the requested analysis. This normally refers to samples contaminated with an organic product that interferes with the sieving process and/or moisture content, porosity and saturation calculations
- SS Sample did not contain the proportion of "fines" required to perform the pipette portion of the grain size analysis
- W Weight of sample in some pipette aliquots was below the level required for accurate weighting

RE: Boeing Plant 2 Source Control, 013-1646-008-500
ARI ID: OB32 & OB33

Dear Kent:

Please find enclosed the original Chain-of-Custody (COC) record, sample receipt documentation, and the final data package for the project referenced above.

Sample receipt information and analytical details are addressed in the Case Narrative.

An electronic copy of this package will be kept on file at ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,
ANALYTICAL RESOURCES, INC.

Kelly Bottem
Client Services Manager

Limits of Liability: ARI will perform all requested services in accordance with appropriate methodology following ARI Standard Operating Procedures and the ARI Quality Assurance Program. This program meets standards for the industry. The total liability of ARI, its officers, agents, employees, or successors, arising out of or in connection with the requested services, shall not exceed the invoiced amount for said services. The acceptance by the client of a proposal for services by ARI release ARI from any liability in excess thereof, notwithstanding any provision to the contrary in any contract, purchase order or co-signed agreement between ARI and the Client.

Sample Retention Policy: All samples submitted to ARI will be appropriately discarded no sooner than 90 days after receipt or 60 days after submission of hardcopy data, whichever is longer, unless alternate retention schedules have been established by work-order or contract.

Cooler Receipt Form

ARI Client: Boeing
 VOC No: _____
 Assigned ARI Job No: OB32

Project Name: _____
 Delivered by: Hand
 Tracking No: _____

Preliminary Examination Phase:

Were intact, properly signed and dated custody seals attached to the outside of to cooler? YES NO
 Were custody papers included with the cooler? YES NO
 Were custody papers properly filled out (ink, signed, etc.) YES NO
 Record cooler temperature (recommended 2.0-6.0 °C for chemistry) 1.2 °C

Cooler Accepted by: MM Date: 11/20/08 Time: 1426

Complete custody forms and attach all shipping documents

Log-In Phase:

Was a temperature blank included in the cooler? YES NO
 What kind of packing material was used? ICE
 Was sufficient ice used (if appropriate)? YES NO
 Were all bottles sealed in individual plastic bags? YES NO
 Did all bottles arrive in good condition (unbroken)? YES NO
 Were all bottle labels complete and legible? YES NO
 Did all bottle labels and tags agree with custody papers? YES NO
 Were all bottles used correct for the requested analyses? YES NO
 Do any of the analyses (bottles) require preservation? (attach preservation checklist) YES NO
 Were all VOC vials free of air bubbles? NA YES NO
 Was sufficient amount of sample sent in each bottle? YES NO

Case Narrative

Project: Boeing Plant 2 Source Control, 013-1646-008-500

ARI ID: OB32 & OB33

Matrix: Water

Date: December 11, 2008

Sample Receipt Information

One water sample was received in good condition at Analytical Resources, Inc. (ARI) on November 20, 2008 under ARI sample delivery groups OB32 and OB33. The cooler temperature measured by IR thermometer was 1.2°C. For further details regarding sample receipt, please refer to the Cooler Receipt Form.

Dissolved Metals by Methods 6010B and 7000 series

The samples were digested between 11/25/08. The digests were analyzed between 12/3/08 and 12/9/08 within the method recommended holding times.

Replicate(s): All percent recoveries were within compliance.

Samples: No anomalies were encountered for these samples.

LCS/Blank Spike(s): All percent recoveries were within compliance.

Method Blank(s): Are in control.

Standard Reference: All percent recoveries were within compliance.

Data Reporting Qualifiers

Effective 12/28/04

Inorganic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Duplicate RPD is not within established control limits
- B Reported value is less than the CRDL but \geq the Reporting Limit
- N Matrix Spike recovery not within established control limits
- NA Not Applicable, analyte not spiked
- H The natural concentration of the spiked element is so much greater than the concentration spiked that an accurate determination of spike recovery is not possible
- L Analyte concentration is ≤ 5 times the Reporting Limit and the replicate control limit defaults to ± 1 RL instead of the normal 20% RPD

Organic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Flagged value is not within established control limits
- B Analyte detected in an associated Method Blank at a concentration greater than one-half of ARI's Reporting Limit or 5% of the regulatory limit or 5% of the analyte concentration in the sample.
- J Estimated concentration when the value is less than ARI's established reporting limits
- D The spiked compound was not detected due to sample extract dilution
- NR Spiked compound recovery is not reported due to chromatographic interference
- E Estimated concentration calculated for an analyte response above the valid instrument calibration range. A dilution is required to obtain an accurate quantification of the analyte.
- S Indicates an analyte response that has saturated the detector. The calculated concentration is not valid; a dilution is required to obtain valid quantification of the analyte
- NA The flagged analyte was not analyzed for
- NS The flagged analyte was not spiked into the sample

- M Estimated value for an analyte detected and confirmed by an analyst but with low spectral match parameters. This flag is used only for GC-MS analyses
- M2 The sample contains PCB congeners that do not match any standard Aroclor pattern. The PCBs are identified and quantified as the Aroclor whose pattern most closely matches that of the sample. The reported value is an estimate.
- N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification"
- Y The analyte is not detected at or above the reported concentration. The reporting limit is raised due to chromatographic interference. The Y flag is equivalent to the U flag with a raised reporting limit.
- C The analyte was positively identified on only one of two chromatographic columns. Chromatographic interference prevented a positive identification on the second column
- P The analyte was detected on both chromatographic columns but the quantified values differ by $\geq 40\%$ RPD with no obvious chromatographic interference

Geotechnical Data

- A The total of all fines fractions. This flag is used to report total fines when only sieve analysis is requested and balances total grain size with sample weight.
- F Samples were frozen prior to particle size determination
- SM Sample matrix was not appropriate for the requested analysis. This normally refers to samples contaminated with an organic product that interferes with the sieving process and/or moisture content, porosity and saturation calculations
- SS Sample did not contain the proportion of "fines" required to perform the pipette portion of the grain size analysis
- W Weight of sample in some pipette aliquots was below the level required for accurate weighting

RE: Boeing Plant 2 Source Control, 013-1646-008-500
ARI ID: OB37 & OB38

Dear Kent:

Please find enclosed the original Chain-of-Custody (COC) records, sample receipt documentation, and the final data package for the project referenced above.

Sample receipt information and analytical details are addressed in the Case Narrative.

An electronic copy of this package will be kept on file at ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,
ANALYTICAL RESOURCES, INC.

A handwritten signature in black ink, appearing to read "Kelly Bottem".

Cooler Receipt Form

ARI Client: Boeing
COC No: _____
Assigned ARI Job No: OB37

Project Name: BPZ Source Control
Delivered by: Hand
Tracking No: _____

Preliminary Examination Phase:

- Were intact, properly signed and dated custody seals attached to the outside of to cooler? YES NO
- Were custody papers included with the cooler? YES NO
- Were custody papers properly filled out (ink, signed, etc.) YES NO
- Record cooler temperature (recommended 2.0-6.0 °C for chemistry) 6.8 °C

Cooler Accepted by: AV Date: 11/21/08 Time: 1446

Complete custody forms and attach all shipping documents

Log-In Phase:

- Was a temperature blank included in the cooler? YES NO
- What kind of packing material was used? ICE/BW
- Was sufficient ice used (if appropriate)? YES NO
- Were all bottles sealed in individual plastic bags? YES NO
- Did all bottle arrive in good condition (unbroken)? YES NO
- Were all bottle labels complete and legible? YES NO
- Did all bottle labels and tags agree with custody papers? YES NO
- Were all bottles used correct for the requested analyses? YES NO
- Do any of the analyses (bottles) require preservation? (attach preservation checklist) YES NO
- Were all VOC vials free of air bubbles? NA YES NO
- Was sufficient amount of sample sent in each bottle? YES NO

Samples Logged by: JW Date: 11/24/08 Time: 845

Case Narrative

Project: Boeing Plant 2 Source Control, 013-1646-008-500

ARI ID: OB37 & OB38

Matrix: Water

Date: December 11, 2008

Sample Receipt Information

One water sample was received in good condition at Analytical Resources, Inc. (ARI) on November 21, 2008 under ARI sample delivery groups OB37 and OB38. The cooler temperature measured by IR thermometer was 6.8°C. For further details regarding sample receipt, please refer to the Cooler Receipt Form.

PCBs by Method 8082:

The sample was extracted on 11/24/08 and analyzed on 11/29/08 within the method recommended holding times.

Initial calibration (s): All analytes of interest were within method acceptance criteria.

Continuing calibration (s): Are in control.

Samples: There were no anomalies associated with these samples.

Surrogates: The surrogate percent recoveries were within control limits.

LCS(s): All LCS percent recoveries were within control limits..

Method Blank: The method blank was free of contamination.

Dissolved Metals by Methods 6010B and 7000 series

The samples were digested on 11/25/08. The digests were analyzed between 11/25/08 and 12/9/08 within the method recommended holding times.

Replicate(s): All percent recoveries were within compliance.

Samples: No anomalies were encountered for these samples.

LCS/Blank Spike(s): All percent recoveries were within compliance.

Method Blank(s): Are in control.

Standard Reference: All percent recoveries were within compliance.

Data Reporting Qualifiers

Effective 12/28/04

Inorganic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Duplicate RPD is not within established control limits
- B Reported value is less than the CRDL but \geq the Reporting Limit
- N Matrix Spike recovery not within established control limits
- NA Not Applicable, analyte not spiked
- H The natural concentration of the spiked element is so much greater than the concentration spiked that an accurate determination of spike recovery is not possible
- L Analyte concentration is ≤ 5 times the Reporting Limit and the replicate control limit defaults to ± 1 RL instead of the normal 20% RPD

Organic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Flagged value is not within established control limits
- B Analyte detected in an associated Method Blank at a concentration greater than one-half of ARI's Reporting Limit or 5% of the regulatory limit or 5% of the analyte concentration in the sample.
- J Estimated concentration when the value is less than ARI's established reporting limits
- D The spiked compound was not detected due to sample extract dilution
- NR Spiked compound recovery is not reported due to chromatographic interference
- E Estimated concentration calculated for an analyte response above the valid instrument calibration range. A dilution is required to obtain an accurate quantification of the analyte.
- S Indicates an analyte response that has saturated the detector. The calculated concentration is not valid; a dilution is required to obtain valid quantification of the analyte
- NA The flagged analyte was not analyzed for
- NS The flagged analyte was not spiked into the sample

- M Estimated value for an analyte detected and confirmed by an analyst but with low spectral match parameters. This flag is used only for GC-MS analyses
- M2 The sample contains PCB congeners that do not match any standard Aroclor pattern. The PCBs are identified and quantified as the Aroclor whose pattern most closely matches that of the sample. The reported value is an estimate.
- N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification"
- Y The analyte is not detected at or above the reported concentration. The reporting limit is raised due to chromatographic interference. The Y flag is equivalent to the U flag with a raised reporting limit.
- C The analyte was positively identified on only one of two chromatographic columns. Chromatographic interference prevented a positive identification on the second column
- P The analyte was detected on both chromatographic columns but the quantified values differ by $\geq 40\%$ RPD with no obvious chromatographic interference

Geotechnical Data

- A The total of all fines fractions. This flag is used to report total fines when only sieve analysis is requested and balances total grain size with sample weight.
- F Samples were frozen prior to particle size determination
- SM Sample matrix was not appropriate for the requested analysis. This normally refers to samples contaminated with an organic product that interferes with the sieving process and/or moisture content, porosity and saturation calculations
- SS Sample did not contain the proportion of "fines" required to perform the pipette portion of the grain size analysis
- W Weight of sample in some pipette aliquots was below the level required for accurate weighting

RE: Boeing Plant 2 Source Control
ARI ID: OC61 and OC62

Dear Will:

Please find enclosed the original *Chain of Custody* (COC) record and final data package for the project referenced above.

Sample receipt information and analytical details are addressed in the *Case Narrative*.

Copies of the reports and all associated raw data will be kept on file at ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,
ANALYTICAL RESOURCES, INC.

Cooler Receipt Form

ARI Client: Boeing
COC No: _____
Assigned ARI Job No: _____

Project Name: _____
Delivered by: Hand
Tracking No: _____

Preliminary Examination Phase:

- Were intact, properly signed and dated custody seals attached to the outside of to cooler? YES NO
- Were custody papers included with the cooler? YES NO
- Were custody papers properly filled out (ink, signed, etc.) YES NO
- Record cooler temperature (recommended 2.0-6.0 °C for chemistry) 12.8 °C

Cooler Accepted by: JH Date: 12-2-08 Time: 13:53

Complete custody forms and attach all shipping documents

no cooler

Log-In Phase:

- Was a temperature blank included in the cooler? YES NO
- What kind of packing material was used?
- Was sufficient ice used (if appropriate)? YES NO
- Were all bottles sealed in individual plastic bags? YES NO
- Did all bottle arrive in good condition (unbroken)? YES NO
- Were all bottle labels complete and legible? YES NO
- Did all bottle labels and tags agree with custody papers? YES NO
- Were all bottles used correct for the requested analyses? YES NO
- Do any of the analyses (bottles) require preservation? (attach preservation checklist) YES NO
- Were all VOC vials free of air bubbles? NA YES NO
- Was sufficient amount of sample sent in each bottle? YES NO

Samples Logged by: AV Date: 12/5/08 Time: 11:06

Case Narrative

Project: Boeing Plant 2 Source Control

ARI ID: OC61 and OC62

Matrix: Filter Bag / Water

Date: December 31, 2008

Sample Receipt Information

One solid matrix sample and one Equipment Blank water sample were received in good condition at ARI on 12/03/08 under ARI sample delivery group OC61 and OC62. One cooler arrived at a temperature of 12.8°C.

PCBs by Method 8082:

The samples were extracted on 12/11/08 and 12/09/08 and analyzed on 12/16/08 and 12/10/08 within the method recommended holding times.

Initial calibration (s): All analytes of interest were within method acceptance criteria.

Continuing calibration (s): Are in control.

Samples: There were no anomalies associated with these samples.

Surrogates: All surrogate recoveries were in control.

LCS(s): All percent recoveries for the analytes of interest were within compliance.

Method Blank: The method blank was free of contamination.

Total and Dissolved Metals by Methods 6010B and 7000 series

The samples were digested on between 12/09/08 and 12/11/08. The digests were analyzed between 12/15/08 and 12/23/08 within the method recommended holding times.

Replicate(s): All percent recoveries were within compliance.

Samples: No anomalies were encountered for these samples.

LCS/Blank Spike(s): All percent recoveries were within compliance.

Method Blank(s): Are in control.

Standard Reference: All percent recoveries were within compliance.

Data Reporting Qualifiers

Effective 12/28/04

Inorganic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Duplicate RPD is not within established control limits
- B Reported value is less than the CRDL but \geq the Reporting Limit
- N Matrix Spike recovery not within established control limits
- NA Not Applicable, analyte not spiked
- H The natural concentration of the spiked element is so much greater than the concentration spiked that an accurate determination of spike recovery is not possible
- L Analyte concentration is ≤ 5 times the Reporting Limit and the replicate control limit defaults to ± 1 RL instead of the normal 20% RPD

Organic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Flagged value is not within established control limits
- B Analyte detected in an associated Method Blank at a concentration greater than one-half of ARI's Reporting Limit or 5% of the regulatory limit or 5% of the analyte concentration in the sample.
- J Estimated concentration when the value is less than ARI's established reporting limits
- D The spiked compound was not detected due to sample extract dilution
- NR Spiked compound recovery is not reported due to chromatographic interference
- E Estimated concentration calculated for an analyte response above the valid instrument calibration range. A dilution is required to obtain an accurate quantification of the analyte.
- S Indicates an analyte response that has saturated the detector. The calculated concentration is not valid; a dilution is required to obtain valid quantification of the analyte
- NA The flagged analyte was not analyzed for
- NS The flagged analyte was not spiked into the sample

- M Estimated value for an analyte detected and confirmed by an analyst but with low spectral match parameters. This flag is used only for GC-MS analyses
- M2 The sample contains PCB congeners that do not match any standard Aroclor pattern. The PCBs are identified and quantified as the Aroclor whose pattern most closely matches that of the sample. The reported value is an estimate.
- N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification"
- Y The analyte is not detected at or above the reported concentration. The reporting limit is raised due to chromatographic interference. The Y flag is equivalent to the U flag with a raised reporting limit.
- C The analyte was positively identified on only one of two chromatographic columns. Chromatographic interference prevented a positive identification on the second column
- P The analyte was detected on both chromatographic columns but the quantified values differ by $\geq 40\%$ RPD with no obvious chromatographic interference

Geotechnical Data

- A The total of all fines fractions. This flag is used to report total fines when only sieve analysis is requested and balances total grain size with sample weight.
- F Samples were frozen prior to particle size determination
- SM Sample matrix was not appropriate for the requested analysis. This normally refers to samples contaminated with an organic product that interferes with the sieving process and/or moisture content, porosity and saturation calculations
- SS Sample did not contain the proportion of "fines" required to perform the pipette portion of the grain size analysis
- W Weight of sample in some pipette aliquots was below the level required for accurate weighting

RE: Boeing Plant 2 Source Control
ARI ID: OG55 & OG57

Dear Kent:

Please find enclosed the original Chain-of-Custody (COC) records, sample receipt documentation, and the final data package for the project referenced above.

Sample receipt information and analytical details are addressed in the Case Narrative.

An electronic copy of this package will be kept on file at ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,
ANALYTICAL RESOURCES, INC.

Case Narrative

Project: Boeing Plant 2 Source Control
ARI ID: OG55 & OG57
Matrix: Water
Date: January 21, 2009

Sample Receipt Information

Three water samples were received in good condition at Analytical Resources, Inc. (ARI) on January 7, 2009 under ARI sample delivery groups OG55 and OG57. The cooler temperature measured by IR thermometer was 5.6°C. For further details regarding sample receipt, please refer to the Cooler Receipt Form.

Select samples were analyzed for the parameters listed below, as requested on the Chain of Custody.

Semivolatiles by Method 8270D:

The sample was extracted on 1/7/09 and analyzed on 1/13/09 within the method recommended holding times.

Initial calibration (s): All analytes of interest were within method acceptance criteria.

Continuing calibration (s): Are in control.

Samples: There were no anomalies associated with these samples.

Surrogates: The surrogate percent recoveries were within control limits.

LCS(s): All LCS percent recoveries were within control limits.

Method Blank: The method blank was free of contamination.

SIM PNAs by Method 8270D SIM:

The sample was extracted on 1/8/09 and analyzed on 1/12/09 within the method recommended holding times.

Initial calibration (s): All analytes of interest were within method acceptance criteria.

Continuing calibration (s): Are in control.

Samples: There were no anomalies associated with these samples.

Surrogates: The surrogate percent recoveries were within control limits.

Case Narrative

Project: Boeing Plant 2 Source Control

ARI ID: OG55 & OG57

Matrix: Water

Date: January 21, 2009

LCS(s): All LCS percent recoveries were within control limits..

Method Blank: The method blank was free of contamination.

Dissolved Metals by Methods 6010B and 7000 series

The samples were digested on 1/8/09. The digests were analyzed between 1/13/09 and 1/20/09 within the method recommended holding times.

Replicate(s): All percent recoveries were within compliance.

Samples: No anomalies were encountered for these samples.

LCS/Blank Spike(s): All percent recoveries were within compliance.

Method Blank(s): Are in control.

Standard Reference: All percent recoveries were within compliance.

The sample duplicate RPD for copper on sample **PL2SC-W-V-010609** was outside of the control limits. All other QC is in control, therefore no further corrective action was taken.

Dissolved Low-Level Mercury by Method SW7470A

The samples were digested on 1/8/09. The digests were analyzed on 1/15/09 within the method recommended holding times.

Replicate(s): All percent recoveries were within compliance.

Samples: No anomalies were encountered for these samples.

LCS/Blank Spike(s): All percent recoveries were within compliance.

Method Blank(s): Are in control.

Standard Reference: All percent recoveries were within compliance.

Case Narrative

Project: Boeing Plant 2 Source Control

ARI ID: OG55 & OG57

Matrix: Water

Date: January 21, 2009

Conventional Chemistry Parameters

The samples were received on 1/7/09 outside of the method recommended holding time for pH.

Replicate(s): All percent recoveries were within compliance.

Samples: No anomalies were encountered for these samples.

LCS/Blank Spike(s): All percent recoveries were within compliance.

Standard Reference: All percent recoveries were within compliance.

Data Reporting Qualifiers

Effective 12/28/04

Inorganic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Duplicate RPD is not within established control limits
- B Reported value is less than the CRDL but \geq the Reporting Limit
- N Matrix Spike recovery not within established control limits
- NA Not Applicable, analyte not spiked
- H The natural concentration of the spiked element is so much greater than the concentration spiked that an accurate determination of spike recovery is not possible
- L Analyte concentration is ≤ 5 times the Reporting Limit and the replicate control limit defaults to ± 1 RL instead of the normal 20% RPD

Organic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Flagged value is not within established control limits
- B Analyte detected in an associated Method Blank at a concentration greater than one-half of ARI's Reporting Limit or 5% of the regulatory limit or 5% of the analyte concentration in the sample.
- J Estimated concentration when the value is less than ARI's established reporting limits
- D The spiked compound was not detected due to sample extract dilution
- NR Spiked compound recovery is not reported due to chromatographic interference
- E Estimated concentration calculated for an analyte response above the valid instrument calibration range. A dilution is required to obtain an accurate quantification of the analyte.
- S Indicates an analyte response that has saturated the detector. The calculated concentration is not valid; a dilution is required to obtain valid quantification of the analyte
- NA The flagged analyte was not analyzed for
- NS The flagged analyte was not spiked into the sample

- M Estimated value for an analyte detected and confirmed by an analyst but with low spectral match parameters. This flag is used only for GC-MS analyses
- M2 The sample contains PCB congeners that do not match any standard Aroclor pattern. The PCBs are identified and quantified as the Aroclor whose pattern most closely matches that of the sample. The reported value is an estimate.
- N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification"
- Y The analyte is not detected at or above the reported concentration. The reporting limit is raised due to chromatographic interference. The Y flag is equivalent to the U flag with a raised reporting limit.
- C The analyte was positively identified on only one of two chromatographic columns. Chromatographic interference prevented a positive identification on the second column
- P The analyte was detected on both chromatographic columns but the quantified values differ by $\geq 40\%$ RPD with no obvious chromatographic interference

Geotechnical Data

- A The total of all fines fractions. This flag is used to report total fines when only sieve analysis is requested and balances total grain size with sample weight.
- F Samples were frozen prior to particle size determination
- SM Sample matrix was not appropriate for the requested analysis. This normally refers to samples contaminated with an organic product that interferes with the sieving process and/or moisture content, porosity and saturation calculations
- SS Sample did not contain the proportion of "fines" required to perform the pipette portion of the grain size analysis
- W Weight of sample in some pipette aliquots was below the level required for accurate weighting

RE: Boeing Plant 2 Source Control
ARI ID: OG70 & OG74

Dear Kent:

Please find enclosed the original Chain-of-Custody (COC) records, sample receipt documentation, and the final data package for the project referenced above.

Sample receipt information and analytical details are addressed in the Case Narrative.

An electronic copy of this package will be kept on file at ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,
ANALYTICAL RESOURCES, INC.

Cooler Receipt Form

ARI Client: Boeing
COC No: _____
Assigned ARI Job No: 0674

Project Name: BP2SC
Delivered by: Hand
Tracking No: _____

Preliminary Examination Phase:

Were intact, properly signed and dated custody seals attached to the outside of to cooler? YES NO
 Were custody papers included with the cooler? YES NO
 Were custody papers properly filled out (ink, signed, etc.) YES NO
 Record cooler temperature (recommended 2.0-6.0 °C for chemistry) 7.2 °C

Cooler Accepted by: JA Date: 1/7/09 Time: 1720

Complete custody forms and attach all shipping documents

Log-In Phase:

Was a temperature blank included in the cooler? YES NO
 What kind of packing material was used? ICE/RTV
 Was sufficient ice used (if appropriate)? YES NO
 Were all bottles sealed in individual plastic bags? YES NO
 Did all bottle arrive in good condition (unbroken)? YES NO
 Were all bottle labels complete and legible? YES NO
 Did all bottle labels and tags agree with custody papers? YES NO
 Were all bottles used correct for the requested analyses? YES NO
 Do any of the analyses (bottles) require preservation? (attach preservation checklist) YES NO
 Were all VOC vials free of air bubbles? NA YES NO
 Was sufficient amount of sample sent in each bottle? YES NO

Samples Logged by: JW Date: 1/8/09 Time: 750

Project: Plant 2 Source Control

ARI JOB NO: OG70 & OG74

**prepared
by**

Analytical Resources, Inc.

**Case Narrative****Project: Boeing Plant 2 Source Control****ARI ID: OG70 & OG74****Matrix: Water****Date: January 22, 2009****Sample Receipt Information**

One water sample was received in good condition at Analytical Resources, Inc. (ARI) on January 7, 2009 under ARI sample delivery groups OG70 and OG74. The cooler temperature measured by IR thermometer was 7.2°C. For further details regarding sample receipt, please refer to the Cooler Receipt Form.

The sample was analyzed for the parameters listed below, as requested on the Chain of Custody.

Dissolved Metals by Methods 6010B and 7000 series

The samples were digested on 1/9/09. The digests were analyzed between 1/13/09 and 1/20/09 within the method recommended holding times.

Replicate(s): All percent recoveries were within compliance.

Samples: No anomalies were encountered for these samples.

LCS/Blank Spike(s): All percent recoveries were within compliance.

Method Blank(s): Are in control.

Standard Reference: All percent recoveries were within compliance.

Dissolved Low-Level Mercury by Method SW7470A

The samples were digested on 1/9/09. The digests were analyzed between on 1/15/09 within the method recommended holding times.

Replicate(s): All percent recoveries were within compliance.

Samples: No anomalies were encountered for these samples.

LCS/Blank Spike(s): All percent recoveries were within compliance.

Method Blank(s): Are in control.

Standard Reference: All percent recoveries were within compliance.

Case Narrative

Project: Boeing Plant 2 Source Control

ARI ID: OG70 & OG74

Matrix: Water

Date: January 22, 2009

Conventional Chemistry Parameters

The digests were analyzed on 1/7/09 within the method recommended holding times.

Replicate(s): All percent recoveries were within compliance.

Samples: No anomalies were encountered for these samples.

LCS/Blank Spike(s): All percent recoveries were within compliance.

Standard Reference: All percent recoveries were within compliance.

Data Reporting Qualifiers

Effective 12/28/04

Inorganic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Duplicate RPD is not within established control limits
- B Reported value is less than the CRDL but \geq the Reporting Limit
- N Matrix Spike recovery not within established control limits
- NA Not Applicable, analyte not spiked
- H The natural concentration of the spiked element is so much greater than the concentration spiked that an accurate determination of spike recovery is not possible
- L Analyte concentration is ≤ 5 times the Reporting Limit and the replicate control limit defaults to ± 1 RL instead of the normal 20% RPD

Organic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Flagged value is not within established control limits
- B Analyte detected in an associated Method Blank at a concentration greater than one-half of ARI's Reporting Limit or 5% of the regulatory limit or 5% of the analyte concentration in the sample.
- J Estimated concentration when the value is less than ARI's established reporting limits
- D The spiked compound was not detected due to sample extract dilution
- NR Spiked compound recovery is not reported due to chromatographic interference
- E Estimated concentration calculated for an analyte response above the valid instrument calibration range. A dilution is required to obtain an accurate quantification of the analyte.
- S Indicates an analyte response that has saturated the detector. The calculated concentration is not valid; a dilution is required to obtain valid quantification of the analyte
- NA The flagged analyte was not analyzed for
- NS The flagged analyte was not spiked into the sample

- M Estimated value for an analyte detected and confirmed by an analyst but with low spectral match parameters. This flag is used only for GC-MS analyses
- M2 The sample contains PCB congeners that do not match any standard Aroclor pattern. The PCBs are identified and quantified as the Aroclor whose pattern most closely matches that of the sample. The reported value is an estimate.
- N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification"
- Y The analyte is not detected at or above the reported concentration. The reporting limit is raised due to chromatographic interference. The Y flag is equivalent to the U flag with a raised reporting limit.
- C The analyte was positively identified on only one of two chromatographic columns. Chromatographic interference prevented a positive identification on the second column
- P The analyte was detected on both chromatographic columns but the quantified values differ by $\geq 40\%$ RPD with no obvious chromatographic interference

Geotechnical Data

- A The total of all fines fractions. This flag is used to report total fines when only sieve analysis is requested and balances total grain size with sample weight.
- F Samples were frozen prior to particle size determination
- SM Sample matrix was not appropriate for the requested analysis. This normally refers to samples contaminated with an organic product that interferes with the sieving process and/or moisture content, porosity and saturation calculations
- SS Sample did not contain the proportion of "fines" required to perform the pipette portion of the grain size analysis
- W Weight of sample in some pipette aliquots was below the level required for accurate weighting

RE: Boeing Plant 2 Source Control
ARI ID: OG77

Dear Will:

Please find enclosed the original *Chain of Custody* (COC) record and final data package for the project referenced above.

Sample receipt information and analytical details are addressed in the *Case Narrative*.

Copies of the reports and all associated raw data will be kept on file at ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,
ANALYTICAL RESOURCES, INC.

Kelly Bottem
Client Services Manager

Cooler Receipt Form

ARI Client: Boeing

Project Name: BPZSC

COC No: NA

Delivered by: Hand

Assigned ARI Job No: OG77

Tracking No: NA

Preliminary Examination Phase:

- Were intact, properly signed and dated custody seals attached to the outside of to cooler? YES NO
- Were custody papers included with the cooler? YES NO
- Were custody papers properly filled out (ink, signed, etc.) YES NO
- Record cooler temperature (recommended 2.0-6.0 °C for chemistry) AMB °C

Cooler Accepted by: JW Date: 1/8/09 Time: 9:10

Complete custody forms and attach all shipping documents

Log-In Phase:

- Was a temperature blank included in the cooler? YES NO
- What kind of packing material was used? Bag
- Was sufficient ice used (if appropriate)? YES NO
- Were all bottles sealed in individual plastic bags? YES NO
- Did all bottle arrive in good condition (unbroken)? YES NO
- Were all bottle labels complete and legible? YES NO
- Did all bottle labels and tags agree with custody papers? YES NO
- Were all bottles used correct for the requested analyses? YES NO
- Do any of the analyses (bottles) require preservation? (attach preservation checklist) YES NO
- Were all VOC vials free of air bubbles? NA YES NO
- Was sufficient amount of sample sent in each bottle? YES NO

Samples Logged by: AW Date: 1/8/09 Time: 10:05

Case Narrative

Project: Boeing Plant 2 Source Control

ARI ID: OG77

Matrix: Filter Bag / Soil

Date: January 22, 2009

Sample Receipt Information

One solid matrix sample and one soil sample were received in good condition at ARI on 01/08/09 under ARI sample delivery group OG77. One cooler arrived at an ambient temperature.

Select samples were analyzed for the parameters listed below, as requested on the COC.

PCBs by Method 8082:

The sample was extracted on 1/15/09 and analyzed on 1/18/09 within the method recommended holding times.

Initial calibration (s): All analytes of interest were within method acceptance criteria.

Continuing calibration (s): Are in control.

Samples: There were no anomalies associated with these samples.

Surrogates: All surrogate recoveries were in control.

LCS(s): All percent recoveries for the analytes of interest were within compliance.

Method Blank: The method blank was free of contamination.

Total Metals by Methods 6010B and 7000 series

The samples were digested on 1/13/09. The digests were analyzed between 1/16/09 and 1/20/09 within the method recommended holding times.

Replicate(s): All percent recoveries were within compliance.

Samples: No anomalies were encountered for these samples.

LCS/Blank Spike(s): All percent recoveries were within compliance.

Method Blank(s): Are in control.

Standard Reference: All percent recoveries were within compliance.

Data Reporting Qualifiers

Effective 12/28/04

Inorganic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Duplicate RPD is not within established control limits
- B Reported value is less than the CRDL but \geq the Reporting Limit
- N Matrix Spike recovery not within established control limits
- NA Not Applicable, analyte not spiked
- H The natural concentration of the spiked element is so much greater than the concentration spiked that an accurate determination of spike recovery is not possible
- L Analyte concentration is ≤ 5 times the Reporting Limit and the replicate control limit defaults to ± 1 RL instead of the normal 20% RPD

Organic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Flagged value is not within established control limits
- B Analyte detected in an associated Method Blank at a concentration greater than one-half of ARI's Reporting Limit or 5% of the regulatory limit or 5% of the analyte concentration in the sample.
- J Estimated concentration when the value is less than ARI's established reporting limits
- D The spiked compound was not detected due to sample extract dilution
- NR Spiked compound recovery is not reported due to chromatographic interference
- E Estimated concentration calculated for an analyte response above the valid instrument calibration range. A dilution is required to obtain an accurate quantification of the analyte.
- S Indicates an analyte response that has saturated the detector. The calculated concentration is not valid; a dilution is required to obtain valid quantification of the analyte
- NA The flagged analyte was not analyzed for
- NS The flagged analyte was not spiked into the sample

- M Estimated value for an analyte detected and confirmed by an analyst but with low spectral match parameters. This flag is used only for GC-MS analyses
- M2 The sample contains PCB congeners that do not match any standard Aroclor pattern. The PCBs are identified and quantified as the Aroclor whose pattern most closely matches that of the sample. The reported value is an estimate.
- N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification"
- Y The analyte is not detected at or above the reported concentration. The reporting limit is raised due to chromatographic interference. The Y flag is equivalent to the U flag with a raised reporting limit.
- C The analyte was positively identified on only one of two chromatographic columns. Chromatographic interference prevented a positive identification on the second column
- P The analyte was detected on both chromatographic columns but the quantified values differ by $\geq 40\%$ RPD with no obvious chromatographic interference

Geotechnical Data

- A The total of all fines fractions. This flag is used to report total fines when only sieve analysis is requested and balances total grain size with sample weight.
- F Samples were frozen prior to particle size determination
- SM Sample matrix was not appropriate for the requested analysis. This normally refers to samples contaminated with an organic product that interferes with the sieving process and/or moisture content, porosity and saturation calculations
- SS Sample did not contain the proportion of "fines" required to perform the pipette portion of the grain size analysis
- W Weight of sample in some pipette aliquots was below the level required for accurate weighting

RE: Boeing Plant 2 Source Control
ARI ID: OH84 & OH86

Dear Kent:

Please find enclosed the original Chain-of-Custody (COC) records, sample receipt documentation, and the final data package for the project referenced above.

Sample receipt information and analytical details are addressed in the Case Narrative.

An electronic copy of this package will be kept on file at ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,
ANALYTICAL RESOURCES, INC.

A handwritten signature in black ink, appearing to read "Kelly Bottem".

Cooler Receipt Form

ARI Client: Boeing
COC No: _____
Assigned ARI Job No: 0H84

Project Name: Boeing Plant 2 Source Contr.
Delivered by: Hand
Tracking No: _____

Preliminary Examination Phase:

Were intact, properly signed and dated custody seals attached to the outside of to cooler? YES NO
 Were custody papers included with the cooler? YES NO
 Were custody papers properly filled out (ink, signed, etc.) YES NO
 Record cooler temperature (recommended 2.0-6.0 °C for chemistry) 6.8 °C
 Cooler Accepted by: AV Date: 1/13/09 Time: 1515

Complete custody forms and attach all shipping documents

Log-In Phase:

Was a temperature blank included in the cooler? YES NO
 What kind of packing material was used? BW
 Was sufficient ice used (if appropriate)? YES NO
 Were all bottles sealed in individual plastic bags? YES NO
 Did all bottle arrive in good condition (unbroken)? YES NO
 Were all bottle labels complete and legible? YES NO
 Did all bottle labels and tags agree with custody papers? YES NO
 Were all bottles used correct for the requested analyses? YES NO
 Do any of the analyses (bottles) require preservation? (attach preservation checklist) YES NO
 Were all VOC vials free of air bubbles? (NA) YES NO
 Was sufficient amount of sample sent in each bottle? YES NO

Samples Logged by: AV Date: 1/14/09 Time: 045

Case Narrative

Project: Boeing Plant 2 Source Control

ARI ID: OH84 & OH86

Matrix: Water

Date: January 27, 2009

Sample Receipt Information

Two water samples were received in good condition at Analytical Resources, Inc. (ARI) on January 13, 2009 under ARI sample delivery groups OH84 and OH86. The cooler temperature measured by IR thermometer was 6.8°C. For further details regarding sample receipt, please refer to the Cooler Receipt Form.

Select samples were analyzed for the parameters listed below, as requested on the Chain of Custody.

PCBs by Method 8082:

The sample was extracted on 1/15/09 and analyzed on 1/17/09 within the method recommended holding times.

Initial calibration (s): All analytes of interest were within method acceptance criteria.

Continuing calibration (s): Are in control.

Samples: There were no anomalies associated with these samples.

Surrogates: The surrogate percent recoveries were within control limits.

LCS(s): All LCS percent recoveries were within control limits..

Method Blank: The method blank was free of contamination.

Dissolved Metals by Methods 6010B and 7000 series

The samples were digested on 1/19/09. The digests were analyzed between 1/20/09 and 1/23/09 within the method recommended holding times.

Replicate(s): All percent recoveries were within compliance.

Samples: No anomalies were encountered for these samples.

LCS/Blank Spike(s): All percent recoveries were within compliance.

Method Blank(s): Are in control.

Case Narrative

Project: Boeing Plant 2 Source Control

ARI ID: OH84 & OH86

Matrix: Water

Date: January 27, 2009

Dissolved Low-Level Mercury by Method SW7470A

The samples were digested on 1/15/09. The digests were analyzed on 1/15/09 within the method recommended holding times.

Replicate(s): All percent recoveries were within compliance.

Samples: No anomalies were encountered for these samples.

LCS/Blank Spike(s): All percent recoveries were within compliance.

Method Blank(s): Are in control.

Standard Reference: All percent recoveries were within compliance.

Data Reporting Qualifiers

Effective 12/28/04

Inorganic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Duplicate RPD is not within established control limits
- B Reported value is less than the CRDL but \geq the Reporting Limit
- N Matrix Spike recovery not within established control limits
- NA Not Applicable, analyte not spiked
- H The natural concentration of the spiked element is so much greater than the concentration spiked that an accurate determination of spike recovery is not possible
- L Analyte concentration is ≤ 5 times the Reporting Limit and the replicate control limit defaults to ± 1 RL instead of the normal 20% RPD

Organic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Flagged value is not within established control limits
- B Analyte detected in an associated Method Blank at a concentration greater than one-half of ARI's Reporting Limit or 5% of the regulatory limit or 5% of the analyte concentration in the sample.
- J Estimated concentration when the value is less than ARI's established reporting limits
- D The spiked compound was not detected due to sample extract dilution
- NR Spiked compound recovery is not reported due to chromatographic interference
- E Estimated concentration calculated for an analyte response above the valid instrument calibration range. A dilution is required to obtain an accurate quantification of the analyte.
- S Indicates an analyte response that has saturated the detector. The calculated concentration is not valid; a dilution is required to obtain valid quantification of the analyte
- NA The flagged analyte was not analyzed for
- NS The flagged analyte was not spiked into the sample

- M Estimated value for an analyte detected and confirmed by an analyst but with low spectral match parameters. This flag is used only for GC-MS analyses
- M2 The sample contains PCB congeners that do not match any standard Aroclor pattern. The PCBs are identified and quantified as the Aroclor whose pattern most closely matches that of the sample. The reported value is an estimate.
- N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification"
- Y The analyte is not detected at or above the reported concentration. The reporting limit is raised due to chromatographic interference. The Y flag is equivalent to the U flag with a raised reporting limit.
- C The analyte was positively identified on only one of two chromatographic columns. Chromatographic interference prevented a positive identification on the second column
- P The analyte was detected on both chromatographic columns but the quantified values differ by $\geq 40\%$ RPD with no obvious chromatographic interference

Geotechnical Data

- A The total of all fines fractions. This flag is used to report total fines when only sieve analysis is requested and balances total grain size with sample weight.
- F Samples were frozen prior to particle size determination
- SM Sample matrix was not appropriate for the requested analysis. This normally refers to samples contaminated with an organic product that interferes with the sieving process and/or moisture content, porosity and saturation calculations
- SS Sample did not contain the proportion of "fines" required to perform the pipette portion of the grain size analysis
- W Weight of sample in some pipette aliquots was below the level required for accurate weighting

RE: Boeing Plant 2 Source Control
ARI ID: OM42

Dear Will:

Please find enclosed the original *Chain of Custody* (COC) record and final data package for the project referenced above.

Sample receipt information and analytical details are addressed in the *Case Narrative*.

Copies of the reports and all associated raw data will be kept on file at ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,
ANALYTICAL RESOURCES, INC.

Limits of Liability: ARI will perform all requested services in accordance with appropriate methodology following ARI Standard Operating Procedures and the ARI Quality Assurance Program. This program meets standards for the industry. The total liability of ARI, its officers, agents, employees, or successors, arising out of or in connection with the requested services, shall not exceed the invoiced amount for said services. The acceptance by the client of a proposal for services by ARI release ARI from any liability in excess thereof, not withstanding any provision to the contrary in any contract, purchase order or co-signed agreement between ARI and the Client.

Sample Retention Policy: All samples submitted to ARI will be appropriately discarded no sooner than 90 days after receipt or 60 days after submission of hardcopy data, whichever is longer, unless alternate retention schedules have been established by work-order or contract.

Cooler Receipt Form

ARI Client: Boeing
COC No: _____
Assigned ARI Job No: _____

Project Name: _____
Delivered by: Hand
Tracking No: _____

Preliminary Examination Phase:

Were intact, properly signed and dated custody seals attached to the outside of to cooler? YES NO
 Were custody papers included with the cooler? YES NO
 Were custody papers properly filled out (ink, signed, etc.) YES NO
 Record cooler temperature (recommended 2.0-6.0 °C for chemistry) AMB °C

Cooler Accepted by: JH Date: 2/12/09 Time: 1235

Complete custody forms and attach all shipping documents

Log-In Phase:

Was a temperature blank included in the cooler? YES NO
 What kind of packing material was used? NA
 Was sufficient ice used (if appropriate)? NA YES NO
 Were all bottles sealed in individual plastic bags? YES NO
 Did all bottle arrive in good condition (unbroken)? YES NO
 Were all bottle labels complete and legible? YES NO
 Did all bottle labels and tags agree with custody papers? YES NO
 Were all bottles used correct for the requested analyses? YES NO
 Do any of the analyses (bottles) require preservation? (attach preservation checklist) YES NO
 Were all VOC vials free of air bubbles? NA YES NO
 Was sufficient amount of sample sent in each bottle? YES NO

Samples Logged by: uu Date: 2/13/09 Time: 852

**Case Narrative**

Project: Boeing Plant 2 Source Control
ARI ID: OM42
Matrix: Filter Bag / Soil
Date: March 3, 2009

Sample Receipt Information

One solid matrix sample and one soil sample were received in good condition at ARI on 02/12/09 under ARI sample delivery group OM42. One cooler arrived at an ambient temperature.

Select samples were analyzed for the parameters listed below, as requested on the COC.

PCBs by Method 8082:

The sample was extracted on 2/19/09 and analyzed on 2/23/09 within the method recommended holding times.

Initial calibration (s): All analytes of interest were within method acceptance criteria.

Continuing calibration (s): Are in control.

Samples: There were no anomalies associated with these samples.

Surrogates: All surrogate recoveries were in control.

LCS(s): All percent recoveries for the analytes of interest were within compliance.

Method Blank: The method blank was free of contamination.

Total Metals by Methods 6010B and 7000 series

The samples were digested on 2/17/09. The digests were analyzed between 2/20/09 and 2/27/09 within the method recommended holding times.

Replicate(s): All percent recoveries were within compliance.

Samples: No anomalies were encountered for these samples.

LCS/Blank Spike(s): All percent recoveries were within compliance.

Method Blank(s): Are in control.

Standard Reference: All percent recoveries were within compliance.

ARI Data Reporting Qualifiers

Effective 11/22/04

Inorganic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Duplicate RPD is not within established control limits
- B Reported value is less than the CRDL but \geq the Reporting Limit
- N Matrix Spike recovery not within established control limits
- NA Not Applicable, analyte not spiked
- H The natural concentration of the spiked element is so much greater than the concentration spiked that an accurate determination of spike recovery is not possible
- L Analyte concentration is ≤ 5 times the Reporting Limit and the replicate control limit defaults to ± 1 RL instead of the normal 20% RPD

Organic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Flagged value is not within established control limits
- B Analyte detected in an associated Method Blank at a concentration greater than one-half of ARI's Reporting Limit or 5% of the regulatory limit or 5% of the analyte concentration in the sample.
- J Estimated concentration when the value is less than ARI's established reporting limits
- D The spiked compound was not detected due to sample extract dilution
- NR Spiked compound recovery is not reported due to chromatographic interference
- E Estimated concentration calculated for an analyte response above the valid instrument calibration range. A dilution is required to obtain an accurate quantification of the analyte.
- S Indicates an analyte response that has saturated the detector. The calculated concentration is not valid; a dilution is required to obtain valid quantification of the analyte
- NA The flagged analyte was not analyzed for
- NS The flagged analyte was not spiked into the sample
- M Estimated value for an analyte detected and confirmed by an analyst but with low spectral match parameters. This flag is used only for GC-MS analyses
- N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification"
- Y The analyte reporting limit is raised due to a positive chromatographic interference. The compound is not detected above the raised limit but may be present at or below the limit
- C The analyte was positively identified on only one of two chromatographic columns. Chromatographic interference prevented a positive identification on the second column
- P The analyte was detected on both chromatographic columns but the quantified values differ by $\geq 40\%$ RPD with no obvious chromatographic interference

Geotechnical Data

- SM Sample matrix was not appropriate for the requested analysis. This normally refers to samples contaminated with an organic product that interferes with the sieving process and/or moisture content, porosity and saturation calculations
- SS Sample did not contain the proportion of "fines" required to perform the pipette portion of the grain size analysis
- W Weight of sample in some pipette aliquots was below the level required for accurate weighing
- F Samples were frozen prior to particle size determination

RE: Boeing Plant 2 Source Control
ARI IDs: ON49 & ON53

Dear Kent:

Please find enclosed the original Chain-of-Custody (COC) records, sample receipt documentation, and the final data package for the project referenced above.

Sample receipt information and analytical details are addressed in the Case Narrative.

An electronic copy of this package will be kept on file at ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,
ANALYTICAL RESOURCES, INC.

Limits of Liability: ARI will perform all requested services in accordance with appropriate methodology following ARI Standard Operating Procedures and the ARI Quality Assurance Program. This program meets standards for the industry. The total liability of ARI, its officers, agents, employees, or successors, arising out of or in connection with the requested services, shall not exceed the invoiced amount for said services. The acceptance by the client of a proposal for services by ARI release ARI from any liability in excess thereof, not withstanding any provision to the contrary in any contract, purchase order or co-signed agreement between ARI and the Client.

Sample Retention Policy: All samples submitted to ARI will be appropriately discarded no sooner than 90 days after receipt or 60 days after submission of hardcopy data, whichever is longer, unless alternate retention schedules have been established by work-order or contract.

Cooler Receipt Form

ARI Client: Boeing
COC No: _____
Assigned ARI Job No: ~~0114~~ 01153

Project Name: _____
Delivered by: Hand
Tracking No: _____

Preliminary Examination Phase:

- Were intact, properly signed and dated custody seals attached to the outside of to cooler? YES NO
- Were custody papers included with the cooler? YES NO
- Were custody papers properly filled out (ink, signed, etc.) YES NO
- Record cooler temperature (recommended 2.0-6.0 °C for chemistry) 11.2 °C

Cooler Accepted by: JH Date: 2/19/09 Time: 1313

Complete custody forms and attach all shipping documents

Log-In Phase:

- Was a temperature blank included in the cooler? YES NO
- What kind of packing material was used? N
- Was sufficient ice used (if appropriate)? YES NO
- Were all bottles sealed in individual plastic bags? YES NO
- Did all bottle arrive in good condition (unbroken)? YES NO
- Were all bottle labels complete and legible? YES NO
- Did all bottle labels and tags agree with custody papers? YES NO
- Were all bottles used correct for the requested analyses? YES NO
- Do any of the analyses (bottles) require preservation? (attach preservation checklist) YES NO
- Were all VOC vials free of air bubbles? NA YES NO
- Was sufficient amount of sample sent in each bottle? YES NO

Analytical Resources, Inc.

Case Narrative

Project: Boeing Plant 2 Source Control
ARI IDs: ON49 & ON53
Matrix: Water
Date: March 5, 2009

Sample Receipt Information

One water sample was received in good condition at Analytical Resources, Inc. (ARI) on February 19, 2009 under ARI sample delivery groups ON49 and ON53. The cooler temperature, as measured by IR thermometer, was 11.2°C. For further details regarding sample receipt, please refer to the Cooler Receipt Form.

Select samples were analyzed for the parameters listed below, as requested on the Chain of Custody.

PCBs by Method 8082:

The sample was extracted on 2/24/09 and analyzed on 2/26/09 within the method recommended holding times.

Initial calibration (s): All analytes of interest were within method acceptance criteria.

Continuing calibration (s): Are in control.

Samples: There were no anomalies associated with these samples.

Surrogates: The surrogate DCBP is out of control high in the LCS and LCSD. All other surrogate and spike recoveries were in control, therefore no further corrective action was taken.

LCS/ LCSD(s): All LCS percent recoveries were within control limits.

Method Blank: The method blank was free of contamination.

Dissolved Metals by Methods 6010B and 7000 series

The samples were digested on 2/23/09. The digests were analyzed on 2/27/09 within the method recommended holding times.

Replicate(s): All percent recoveries were within compliance.

Samples: No anomalies were encountered for these samples.

LCS/Blank Spike(s): All percent recoveries were within compliance.

Method Blank(s): Are in control.

Case Narrative

Project: Boeing Plant 2 Source Control

ARI IDs: ON49 & ON53

Matrix: Water

Date: March 5, 2009

Dissolved Low-Level Mercury by Method SW7470A

The samples were digested on 2/24/09. The digests were analyzed on 2/26/09 within the method recommended holding times.

Replicate(s): All percent recoveries were within compliance.

Samples: No anomalies were encountered for these samples.

LCS/Blank Spike(s): All percent recoveries were within compliance.

Method Blank(s): Are in control.

Standard Reference: All percent recoveries were within compliance.

ARI Data Reporting Qualifiers

Effective 11/22/04

Inorganic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Duplicate RPD is not within established control limits
- B Reported value is less than the CRDL but \geq the Reporting Limit
- N Matrix Spike recovery not within established control limits
- NA Not Applicable, analyte not spiked
- H The natural concentration of the spiked element is so much greater than the concentration spiked that an accurate determination of spike recovery is not possible
- L Analyte concentration is ≤ 5 times the Reporting Limit and the replicate control limit defaults to ± 1 RL instead of the normal 20% RPD

Organic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Flagged value is not within established control limits
- B Analyte detected in an associated Method Blank at a concentration greater than one-half of ARI's Reporting Limit or 5% of the regulatory limit or 5% of the analyte concentration in the sample.
- J Estimated concentration when the value is less than ARI's established reporting limits
- D The spiked compound was not detected due to sample extract dilution
- NR Spiked compound recovery is not reported due to chromatographic interference
- E Estimated concentration calculated for an analyte response above the valid instrument calibration range. A dilution is required to obtain an accurate quantification of the analyte.
- S Indicates an analyte response that has saturated the detector. The calculated concentration is not valid; a dilution is required to obtain valid quantification of the analyte
- NA The flagged analyte was not analyzed for
- NS The flagged analyte was not spiked into the sample
- M Estimated value for an analyte detected and confirmed by an analyst but with low spectral match parameters. This flag is used only for GC-MS analyses
- N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification"
- Y The analyte reporting limit is raised due to a positive chromatographic interference. The compound is not detected above the raised limit but may be present at or below the limit
- C The analyte was positively identified on only one of two chromatographic columns. Chromatographic interference prevented a positive identification on the second column
- P The analyte was detected on both chromatographic columns but the quantified values differ by $\geq 40\%$ RPD with no obvious chromatographic interference

Geotechnical Data

- SM Sample matrix was not appropriate for the requested analysis. This normally refers to samples contaminated with an organic product that interferes with the sieving process and/or moisture content, porosity and saturation calculations
- SS Sample did not contain the proportion of "fines" required to perform the pipette portion of the grain size analysis
- W Weight of sample in some pipette aliquots was below the level required for accurate weighing
- F Samples were frozen prior to particle size determination

RE: Boeing Plant 2 Source Control
ARI IDs: OO10 & OO11 and OO85 & OO87

Dear Kent:

Please find enclosed the original Chain-of-Custody (COC) records, sample receipt documentation, and the final data package for the project referenced above.

Sample receipt information and analytical details are addressed in the Case Narrative.

An electronic copy of this package will be kept on file at ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,
ANALYTICAL RESOURCES, INC.

A handwritten signature in black ink, appearing to read "Kelly Bottem".

Limits of Liability: ARI will perform all requested services in accordance with appropriate methodology following ARI Standard Operating Procedures and the ARI Quality Assurance Program. This program meets standards for the industry. The total liability of ARI, its officers, agents, employees, or successors, arising out of or in connection with the requested services, shall not exceed the invoiced amount for said services. The acceptance by the client of a proposal for services by ARI release ARI from any liability in excess thereof, not withstanding any provision to the contrary in any contract, purchase order or co-signed agreement between ARI and the Client.

Sample Retention Policy: All samples submitted to ARI will be appropriately discarded no sooner than 90 days after receipt or 60 days after submission of hardcopy data, whichever is longer, unless alternate retention schedules have been established by work-order or contract.

Comments/Special Instructions: SMS metals as per QAPP.

Relinquished by: (Signature) Elizabeth Shea, (Printed Name) Elizabeth Shea, Company: ARI, Date & Time: 2/27/09 1402

Received by: (Signature) Mikko Mulumba, (Printed Name) Mikko Mulumba, Company: ARI, Date & Time: 2/27/09 1402

Limits of Liability: ARI will perform all requested services in accordance with appropriate methodology following ARI Standard Operating Procedures and the ARI Quality Assurance Program. This program meets standards for the industry. The total liability of ARI, its officers, agents, employees, or successors, arising out of or in connection with the requested services, shall not exceed the invoiced amount for said services. The acceptance by the client of a proposal for services by ARI release ARI from any liability in excess thereof, notwithstanding any provision to the contrary in any contract, purchase order or co-signed agreement between ARI and the Client.

Sample Retention Policy: All samples submitted to ARI will be appropriately discarded no sooner than 90 days after receipt or 60 days after submission of hardcopy data, whichever is longer, unless alternate retention schedules have been established by work-order or contract.

Cooler Receipt Form

ARI Client: [REDACTED]

Project Name: _____

COC No: NA

Delivered by: HAND

Assigned ARI Job No: 0087

Tracking No: NA

Preliminary Examination Phase:

Were intact, properly signed and dated custody seals attached to the outside of to cooler?	YES	<input checked="" type="radio"/> NO
Were custody papers included with the cooler?	<input checked="" type="radio"/> YES	NO
Were custody papers properly filled out (ink, signed, etc.)	<input checked="" type="radio"/> YES	NO
Record cooler temperature (recommended 2.0-6.0 °C for chemistry)		<u>12.6 °C</u>

Cooler Accepted by: MM Date: 2/27/2009 Time: 1402

Complete custody forms and attach all shipping documents

Log-In Phase:

Was a temperature blank included in the cooler?	YES	<input checked="" type="radio"/> NO
What kind of packing material was used?	<input checked="" type="radio"/> YES	NO
Was sufficient ice used (if appropriate)?	<input checked="" type="radio"/> YES	NO
Were all bottles sealed in individual plastic bags?	YES	<input checked="" type="radio"/> NO
Did all bottle arrive in good condition (unbroken)?	<input checked="" type="radio"/> YES	NO
Were all bottle labels complete and legible?	<input checked="" type="radio"/> YES	NO
Did all bottle labels and tags agree with custody papers?	YES	<input checked="" type="radio"/> NO
Were all bottles used correct for the requested analyses?	<input checked="" type="radio"/> YES	NO
Do any of the analyses (bottles) require preservation? (attach preservation checklist)	<input checked="" type="radio"/> YES	NO
Were all VOC vials free of air bubbles?	<input checked="" type="radio"/> YES	NO
Was sufficient amount of sample sent in each bottle?	<input checked="" type="radio"/> YES	NO

Samples Logged by: W Date: 2/27/2009 Time: 1452

**** Notify Project Manager of discrepancies or concerns ****

Explain discrepancies or negative responses:

Sample bottle reads sampling time as 1230, COC reads sampling time as 1130

Analytical Resources, Inc.

**Case Narrative**

Project: Boeing Plant 2 Source Control
ARI IDs: OO10 & OO11 and OO85 & OO87
Matrix: Water
Date: March 13, 2009

Sample Receipt Information

One water sample was received in good condition at Analytical Resources, Inc. (ARI) on February 24, 2009 under ARI sample delivery groups OO10 and OO11 and one water sample and a filter bag were received on 2/27/09 under ARI delivery groups OO85 and OO87. The filter bag was placed on hold pending further instructions. The cooler temperatures, as measured by IR thermometer, were 12.6 and 2.6°C. For further details regarding sample receipt, please refer to the Cooler Receipt Form.

Select samples were analyzed for the parameters listed below, as requested on the Chain of Custody.

PCBs by Method 8082:

The samples were extracted on 03/3/09 and analyzed on 03/4/09 within the method recommended holding times.

Initial calibration (s): All analytes of interest were within method acceptance criteria.

Continuing calibration (s): Are in control.

Samples: There were no anomalies associated with these samples.

Surrogates: All surrogate recoveries were in control.

LCS(s): All percent recoveries for the analytes of interest were within compliance.

Method Blank: The method blank was free of contamination.

Dissolved Metals by Methods 6010B and 7000 series

The samples were digested on 3/2/09 and 3/3/09. The digests were analyzed on 3/3/09 and 3/5/09 within the method recommended holding times.

Replicate(s): All percent recoveries were within compliance.

Samples: No anomalies were encountered for these samples.

LCS/Blank Spike(s): All percent recoveries were within compliance.

Method Blank(s): Are in control.

Case Narrative

Project: Boeing Plant 2 Source Control
ARI IDs: OO10 & OO11 and OO85 & OO87
Matrix: Water
Date: March 13, 2009

Dissolved Low-Level Mercury by Method SW7470A

The samples were digested on 2/26/09 and 3/3/09. The digests were analyzed on 2/26/09 and 3/11/09 within the method recommended holding times.

Replicate(s): All percent recoveries were within compliance.

Samples: No anomalies were encountered for these samples.

LCS/Blank Spike(s): All percent recoveries were within compliance.

Method Blank(s): Are in control.

Standard Reference: All percent recoveries were within compliance.

Data Reporting Qualifiers

Effective 12/28/04

Inorganic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Duplicate RPD is not within established control limits
- B Reported value is less than the CRDL but \geq the Reporting Limit
- N Matrix Spike recovery not within established control limits
- NA Not Applicable, analyte not spiked
- H The natural concentration of the spiked element is so much greater than the concentration spiked that an accurate determination of spike recovery is not possible
- L Analyte concentration is ≤ 5 times the Reporting Limit and the replicate control limit defaults to ± 1 RL instead of the normal 20% RPD

Organic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Flagged value is not within established control limits
- B Analyte detected in an associated Method Blank at a concentration greater than one-half of ARI's Reporting Limit or 5% of the regulatory limit or 5% of the analyte concentration in the sample.
- J Estimated concentration when the value is less than ARI's established reporting limits
- D The spiked compound was not detected due to sample extract dilution
- NR Spiked compound recovery is not reported due to chromatographic interference
- E Estimated concentration calculated for an analyte response above the valid instrument calibration range. A dilution is required to obtain an accurate quantification of the analyte.
- S Indicates an analyte response that has saturated the detector. The calculated concentration is not valid; a dilution is required to obtain valid quantification of the analyte
- NA The flagged analyte was not analyzed for
- NS The flagged analyte was not spiked into the sample

- M Estimated value for an analyte detected and confirmed by an analyst but with low spectral match parameters. This flag is used only for GC-MS analyses
- M2 The sample contains PCB congeners that do not match any standard Aroclor pattern. The PCBs are identified and quantified as the Aroclor whose pattern most closely matches that of the sample. The reported value is an estimate.
- N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification"
- Y The analyte is not detected at or above the reported concentration. The reporting limit is raised due to chromatographic interference. The Y flag is equivalent to the U flag with a raised reporting limit.
- C The analyte was positively identified on only one of two chromatographic columns. Chromatographic interference prevented a positive identification on the second column
- P The analyte was detected on both chromatographic columns but the quantified values differ by $\geq 40\%$ RPD with no obvious chromatographic interference

Geotechnical Data

- A The total of all fines fractions. This flag is used to report total fines when only sieve analysis is requested and balances total grain size with sample weight.
- F Samples were frozen prior to particle size determination
- SM Sample matrix was not appropriate for the requested analysis. This normally refers to samples contaminated with an organic product that interferes with the sieving process and/or moisture content, porosity and saturation calculations
- SS Sample did not contain the proportion of "fines" required to perform the pipette portion of the grain size analysis
- W Weight of sample in some pipette aliquots was below the level required for accurate weighting

RE: Boeing Plant 2 Source Control
ARI IDs: OP48 & OP51

Dear Kent:

Please find enclosed the original Chain of Custody (COC) records, sample receipt documentation, and the final data package for the project referenced above.

Sample receipt information and analytical details are addressed in the Case Narrative.

An electronic copy of this package will be kept on file at ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,
ANALYTICAL RESOURCES, INC.

A handwritten signature in black ink, appearing to read "Kelly Bottem".

Limits of Liability: ARI will perform all requested services in accordance with appropriate methodology following ARI Standard Operating Procedures and the ARI Quality Assurance Program. This program meets standards for the industry. The total liability of ARI, its officers, agents, employees, or successors, arising out of or in connection with the requested services, shall not exceed the invoiced amount for said services. The acceptance by the client of a proposal for services by ARI release ARI from any liability in excess thereof, notwithstanding any provision to the contrary in any contract, purchase order or co-signed agreement between ARI and the Client.

Sample Retention Policy: All samples submitted to ARI will be appropriately discarded no sooner than 90 days after receipt or 60 days after submission of hardcopy data, whichever is longer, unless alternate retention schedules have been established by work-order or contract.

Cooler Receipt Form

ARI Client: Baeing
COC No: NA
Assigned ARI Job No: OP48

Project Name: BP2 Source Control
Delivered by: Hand
Tracking No: NA

Preliminary Examination Phase:

Were intact, properly signed and dated custody seals attached to the outside of to cooler? YES NO

Were custody papers included with the cooler? YES NO

Were custody papers properly filled out (ink, signed, etc.) YES NO

Record cooler temperature (recommended 2.0-6.0 °C for chemistry) 6.8 °C

Cooler Accepted by: JW Date: 3/5/09 Time: 1120

Complete custody forms and attach all shipping documents

Log-In Phase:

Was a temperature blank included in the cooler? YES NO

What kind of packing material was used?

Was sufficient ice used (if appropriate)? YES NO

Were all bottles sealed in individual plastic bags? YES NO

Did all bottle arrive in good condition (unbroken)? YES NO

Were all bottle labels complete and legible? YES NO

Did all bottle labels and tags agree with custody papers? YES NO

Were all bottles used correct for the requested analyses? YES NO

Do any of the analyses (bottles) require preservation? (attach preservation checklist) YES NO

Were all VOC vials free of air bubbles? NA YES NO

Was sufficient amount of sample sent in each bottle? YES NO

Samples Logged by: AV Date: 3/5/09 Time: 1339

Limits of Liability: ARI will perform all requested services in accordance with appropriate methodology following ARI Standard Operating Procedures and the ARI Quality Assurance Program. This program meets standards for the industry. The total liability of ARI, its officers, agents, employees, or successors, arising out of or in connection with the requested services, shall not exceed the invoiced amount for said services. The acceptance by the client of a proposal for services by ARI release ARI from any liability in excess thereof, not withstanding any provision to the contrary in any contract, purchase order or co-signed agreement between ARI and the Client.

Sample Retention Policy: All samples submitted to ARI will be appropriately discarded no sooner than 90 days after receipt or 60 days after submission of hardcopy data, whichever is longer, unless alternate retention schedules have been established by work-order or contract.

Cooler Receipt Form

ARI Client: Boeing
COC No: NA
Assigned ARI Job No: OP51

Project Name: BP2 Source Control
Delivered by: Hand
Tracking No: NA

Preliminary Examination Phase:

Were intact, properly signed and dated custody seals attached to the outside of to cooler? YES NO
 Were custody papers included with the cooler? YES NO
 Were custody papers properly filled out (ink, signed, etc.) YES NO
 Record cooler temperature (recommended 2.0-6.0 °C for chemistry) 6.8 °C

Cooler Accepted by: JW Date: 3/5/09 Time: 1120

Complete custody forms and attach all shipping documents

Log-In Phase:

Was a temperature blank included in the cooler? YES NO
 What kind of packing material was used?
 Was sufficient ice used (if appropriate)? YES NO
 Were all bottles sealed in individual plastic bags? YES NO
 Did all bottle arrive in good condition (unbroken)? YES NO
 Were all bottle labels complete and legible? YES NO
 Did all bottle labels and tags agree with custody papers? YES NO
 Were all bottles used correct for the requested analyses? YES NO
 Do any of the analyses (bottles) require preservation? (attach preservation checklist) YES NO
 Were all VOC vials free of air bubbles? NA YES NO
 Was sufficient amount of sample sent in each bottle? YES NO

Case Narrative

Project: Boeing Plant 2 Source Control
ARI IDs: OP48 & OP51
Matrix: Water
Date: March 19, 2009

Sample Receipt Information

One water sample was received in good condition at Analytical Resources, Inc. (ARI) on March 5, 2009 under ARI sample delivery groups (SDGs) OP48 and OP51. The cooler temperature, as measured by IR thermometer, was 6.8°C. For further details regarding sample receipt, please refer to the enclosed Cooler Receipt Form and Preservation Verification sheet.

The sample was analyzed for the parameters listed below, as requested on the Chain of Custody.

Dissolved Metals by Methods 6010B and 7000 series

The samples were digested on 3/9/09. The digests were analyzed between 3/13/09 and 3/16/09 within the method recommended holding times.

Replicate(s): All percent recoveries were within compliance.

Samples: No anomalies were encountered for these samples.

LCS/Blank Spike(s): All percent recoveries were within compliance.

Method Blank(s): Are in control.

Dissolved Low-Level Mercury by Method SW7470A

The samples were digested on 3/9/09. The digests were analyzed on 3/11/09 within the method recommended holding times.

Replicate(s): All percent recoveries were within compliance.

Samples: No anomalies were encountered for these samples.

LCS/Blank Spike(s): All percent recoveries were within compliance.

Method Blank(s): Are in control.

Standard Reference: All percent recoveries were within compliance.

Dear Kent:

Please find enclosed the original Chain of Custody (COC) records, sample receipt documentation, and the final data package for the project referenced above.

Sample receipt information and analytical details are addressed in the Case Narrative.

An electronic copy of this package will be kept on file at ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,
ANALYTICAL RESOURCES, INC.

Limits of Liability: ARI will perform all requested services in accordance with appropriate methodology following ARI Standard Operating Procedures and the ARI Quality Assurance Program. This program meets standards for the industry. The total liability of ARI, its officers, agents, employees, or successors, arising out of or in connection with the requested services, shall not exceed the invoiced amount for said services. The acceptance by the client of a proposal for services by ARI release ARI from any liability in excess thereof, not withstanding any provision to the contrary in any contract, purchase order or co-signed agreement between ARI and the Client.

Sample Retention Policy: All samples submitted to ARI will be appropriately discarded no sooner than 90 days after receipt or 60 days after submission of hardcopy data, whichever is longer, unless alternate retention schedules have been established by work-order or contract.

Cooler Receipt Form

ARI Client: Boeing
 COC No(s): _____ (NA)
 Assigned ARI Job No: OS73

Project Name: Boeing Plant 2 Source Control
 Delivered by: Fed-Ex UPS Courier Hand Delivered Other: _____
 Tracking No: _____ (NA)

Preliminary Examination Phase:

Were intact, properly signed and dated custody seals attached to the outside of to cooler? YES NO
 Were custody papers included with the cooler? YES NO
 Were custody papers properly filled out (ink, signed, etc.) YES NO
 Temperature of Cooler(s) (°C) (recommended 2.0-6.0 °C for chemistry) 7.4
 If cooler temperature is out of compliance fill out form 00070F Temp Gun ID#: 101266

Cooler Accepted by: JH Date: 3/28/09 Time: 1230
Complete custody forms and attach all shipping documents

Log-In Phase:

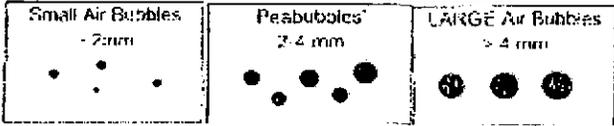

Was a temperature blank included in the cooler? YES NO
 What kind of packing material was used? ... Bubble Wrap Wet Ice Gel Packs Baggies Foam Block Paper Other: 7.2
 Was sufficient ice used (if appropriate)? NA YES NO
 Were all bottles sealed in individual plastic bags? YES NO
 Did all bottles arrive in good condition (unbroken)? YES NO
 Were all bottle labels complete and legible? YES NO
 Did the number of containers listed on COC match with the number of containers received? YES NO
 Did all bottle labels and tags agree with custody papers? YES NO
 Were all bottles used correct for the requested analyses? YES NO
 Do any of the analyses (bottles) require preservation? (attach preservation sheet, excluding VOCs)... NA YES NO
 Were all VOC vials free of air bubbles? NA YES NO
 Was sufficient amount of sample sent in each bottle? YES NO

Project: BOEING PLANT 2 SOURCE CONTROL

ARI JOB NO: OR49, OS60, OS61, OS73, OS79

prepared
by

Analytical Resources, Inc.

**Case Narrative**

Project: Boeing Plant 2 Source Control
ARI IDs: OR49, OS60, OS61, OS73, OS79
Matrix: Water, Filter Bag
Date: April 10, 2009

Sample Receipt Information

One filter bag sample was received in good condition at Analytical Resources, Inc. (ARI) on March 19, 2009 under ARI sample delivery groups (SDGs) OR49 and three water samples were received in good condition at Analytical Resources, Inc. (ARI) on March 27, 2009 and March 28, 2009 under ARI sample delivery groups (SDGs) OS60, OS61, OS73 and OS79. The cooler temperatures, as measured by IR thermometer, were AMB, 6.0 and 7.4°C. For further details regarding sample receipt, please refer to the enclosed Cooler Receipt Form and Preservation Verification sheet.

The samples were analyzed for the parameters listed below, as requested on the Chain of Custody.

PCBs by Method 8082:

The filter bag sample was extracted on 3/30/09 and analyzed on 4/1/09 within the method recommended holding times. The water sample was extracted on 3/30/09 and analyzed on 4/4/09 within the method recommended holding time.

Initial calibration (s): All analytes of interest were within method acceptance criteria.

Continuing calibration (s): Are in control.

Samples: There were no anomalies associated with these samples.

Surrogates: The surrogate DCBP is out of control high and the surrogate TCMX is out of control low for the method blank. TCMX is not required per the analysis method and the method blank was non-detect, therefore no further corrective action was taken.

The LCSD surrogate DCBP is out of control high. The LCS was in control, therefore no further corrective action was taken.

LCS(s): All percent recoveries for the analytes of interest were within compliance.

Method Blank: The method blank was free of contamination.

Dissolved Metals by Methods 6010B and 7000 series

The samples were digested on 3/31/09. The digests were analyzed between 4/3/09 and 4/7/09 within the method recommended holding times.

Case Narrative

Project: Boeing Plant 2 Source Control
ARI IDs: OR49, OS60, OS61, OS73, OS79
Matrix: Water, Filter Bag
Date: April 10, 2009

Replicate(s): All percent recoveries were within compliance.

Samples: No anomalies were encountered for these samples.

LCS/Blank Spike(s): All percent recoveries were within compliance.

Method Blank(s): Are in control.

Dissolved Low-Level Mercury by Method SW7470A

The samples were digested on 3/30/09 and 3/31/09. The digests were analyzed on 4/1/09 within the method recommended holding times.

Replicate(s): All percent recoveries were within compliance.

Samples: No anomalies were encountered for these samples.

LCS/Blank Spike(s): All percent recoveries were within compliance.

Method Blank(s): Are in control.

Standard Reference: All percent recoveries were within compliance.

ARI Job No.: OR49

Client ID: The Boeing Company

Parameter: PCB

Client Project: BP2 Source Control

SOP Number(s): 3545

No Anomalies:

List problems, concerns, corrective actions and any other pertinent information

Filter Bag weight wet = 317.04g

Metals soil/solid split = Insufficient Volume (No Metals split)

Filter Bag weight Dry with Plastic Ring = 112.36g

Plastic Ring weight = 8.46g

Filter Bag weight Dry without Plastic Ring = 103.90g

extract required high volume acid clean, transferred and Acid cleaned a second time, color remained. -vw 3/31/09

extract emulsed at water wash portion of sulfur clean, centrifuged to break, leaving a yellow top layer

white layer under that, cloudy layer under that and a clear layer at the bottom -vw 3/31/09

Analyst Initials:

Date:

Data Reporting Qualifiers

Effective 12/28/04

Inorganic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Duplicate RPD is not within established control limits
- B Reported value is less than the CRDL but \geq the Reporting Limit
- N Matrix Spike recovery not within established control limits
- NA Not Applicable, analyte not spiked
- H The natural concentration of the spiked element is so much greater than the concentration spiked that an accurate determination of spike recovery is not possible
- L Analyte concentration is ≤ 5 times the Reporting Limit and the replicate control limit defaults to ± 1 RL instead of the normal 20% RPD

Organic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Flagged value is not within established control limits
- B Analyte detected in an associated Method Blank at a concentration greater than one-half of ARI's Reporting Limit or 5% of the regulatory limit or 5% of the analyte concentration in the sample.
- J Estimated concentration when the value is less than ARI's established reporting limits
- D The spiked compound was not detected due to sample extract dilution
- NR Spiked compound recovery is not reported due to chromatographic interference
- E Estimated concentration calculated for an analyte response above the valid instrument calibration range. A dilution is required to obtain an accurate quantification of the analyte.
- S Indicates an analyte response that has saturated the detector. The calculated concentration is not valid; a dilution is required to obtain valid quantification of the analyte
- NA The flagged analyte was not analyzed for

- NS The flagged analyte was not spiked into the sample
- M Estimated value for an analyte detected and confirmed by an analyst but with low spectral match parameters. This flag is used only for GC-MS analyses
- M2 The sample contains PCB congeners that do not match any standard Aroclor pattern. The PCBs are identified and quantified as the Aroclor whose pattern most closely matches that of the sample. The reported value is an estimate.
- N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification"
- Y The analyte is not detected at or above the reported concentration. The reporting limit is raised due to chromatographic interference. The Y flag is equivalent to the U flag with a raised reporting limit.
- C The analyte was positively identified on only one of two chromatographic columns. Chromatographic interference prevented a positive identification on the second column
- P The analyte was detected on both chromatographic columns but the quantified values differ by $\geq 40\%$ RPD with no obvious chromatographic interference

Geotechnical Data

- A The total of all fines fractions. This flag is used to report total fines when only sieve analysis is requested and balances total grain size with sample weight.
- F Samples were frozen prior to particle size determination
- SM Sample matrix was not appropriate for the requested analysis. This normally refers to samples contaminated with an organic product that interferes with the sieving process and/or moisture content, porosity and saturation calculations
- SS Sample did not contain the proportion of "fines" required to perform the pipette portion of the grain size analysis
- W Weight of sample in some pipette aliquots was below the level required for accurate weighting

RE: Boeing Plant 2 Source Control
ARI ID: OW01

Dear Will:

Please find enclosed the original *Chain of Custody* (COC) record and final data package for the project referenced above.

Sample receipt information and analytical details are addressed in the *Case Narrative*.

Copies of the reports and all associated raw data will be kept on file at ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,
ANALYTICAL RESOURCES, INC.

Cooler Receipt Form

ARI Client: Boeing

Project Name: BP2 Source Control

COC No(s): _____ (NA)

Delivered by: Fed-Ex UPS Courier Hand Delivered Other: _____

Assigned ARI Job No: _____

Tracking No: _____ (NA)

Preliminary Examination Phase:

Were intact, properly signed and dated custody seals attached to the outside of to cooler? YES NO

Were custody papers included with the cooler? YES NO

Were custody papers properly filled out (ink, signed, etc.) YES NO

Temperature of Cooler(s) (°C) (recommended 2.0-6.0 °C for chemistry)..... AMB

If cooler temperature is out of compliance fill out form 00070F Temp Gun ID#: _____

Cooler Accepted by: JW Date: 4/17/09 Time: 1315

Complete custody forms and attach all shipping documents

Log-In Phase:

Was a temperature blank included in the cooler? YES NO

What kind of packing material was used? ... Bubble Wrap Wet Ice Gel Packs Baggies Foam Block Paper Other: _____

Was sufficient ice used (if appropriate)? NA YES NO

Were all bottles sealed in individual plastic bags? YES NO

Did all bottles arrive in good condition (unbroken)? YES NO

Were all bottle labels complete and legible? YES NO

Did the number of containers listed on COC match with the number of containers received? YES NO

Did all bottle labels and tags agree with custody papers? YES NO

Were all bottles used correct for the requested analyses? YES NO

Do any of the analyses (bottles) require preservation? (attach preservation sheet, excluding VOCs)... NA YES NO

Were all VOC vials free of air bubbles? NA YES NO

Was sufficient amount of sample sent in each bottle? YES NO

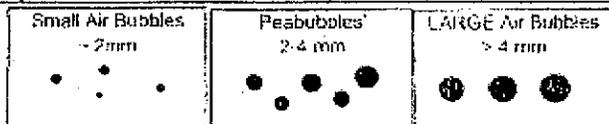

Samples Logged by: MM Date: 4/17/09 Time: 1345

**** Notify Project Manager of discrepancies or concerns ****

Case Narrative

Project: Boeing Plant 2 Source Control
ARI ID: OW01
Matrix: Filter Bag / Soil
Date: May 5, 2009

Sample Receipt Information

One solid matrix sample was received in good condition at ARI on 04/17/09 under ARI sample delivery group OW01. One cooler arrived at an ambient temperature.

Select samples were analyzed for the parameters listed below, as requested on the COC.

PCBs by Method 8082:

The sample was extracted on 4/22/09 and analyzed on 4/30/09 within the method recommended holding times.

Initial calibration (s): All analytes of interest were within method acceptance criteria.

Continuing calibration (s): Are in control.

Samples: There were no anomalies associated with these samples.

Surrogates: All surrogate recoveries were in control.

LCS(s): All percent recoveries for the analytes of interest were within compliance.

Method Blank: The method blank was free of contamination.

Total Metals by Methods 6010B and 7000 series

The samples were digested on 4/20/09. The digests were analyzed between 4/23/09 and 5/1/09 within the method recommended holding times.

Samples: No anomalies were encountered for these samples.

LCS/Blank Spike(s): All percent recoveries were within compliance.

Method Blank(s): Are in control.

Standard Reference: All percent recoveries were within compliance.

Data Reporting Qualifiers

Effective 12/28/04

Inorganic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Duplicate RPD is not within established control limits
- B Reported value is less than the CRDL but \geq the Reporting Limit
- N Matrix Spike recovery not within established control limits
- NA Not Applicable, analyte not spiked
- H The natural concentration of the spiked element is so much greater than the concentration spiked that an accurate determination of spike recovery is not possible
- L Analyte concentration is ≤ 5 times the Reporting Limit and the replicate control limit defaults to ± 1 RL instead of the normal 20% RPD

Organic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Flagged value is not within established control limits
- B Analyte detected in an associated Method Blank at a concentration greater than one-half of ARI's Reporting Limit or 5% of the regulatory limit or 5% of the analyte concentration in the sample.
- J Estimated concentration when the value is less than ARI's established reporting limits
- D The spiked compound was not detected due to sample extract dilution
- NR Spiked compound recovery is not reported due to chromatographic interference
- E Estimated concentration calculated for an analyte response above the valid instrument calibration range. A dilution is required to obtain an accurate quantification of the analyte.
- S Indicates an analyte response that has saturated the detector. The calculated concentration is not valid; a dilution is required to obtain valid quantification of the analyte
- NA The flagged analyte was not analyzed for

- NS The flagged analyte was not spiked into the sample
- M Estimated value for an analyte detected and confirmed by an analyst but with low spectral match parameters. This flag is used only for GC-MS analyses
- M2 The sample contains PCB congeners that do not match any standard Aroclor pattern. The PCBs are identified and quantified as the Aroclor whose pattern most closely matches that of the sample. The reported value is an estimate.
- N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification"
- Y The analyte is not detected at or above the reported concentration. The reporting limit is raised due to chromatographic interference. The Y flag is equivalent to the U flag with a raised reporting limit.
- C The analyte was positively identified on only one of two chromatographic columns. Chromatographic interference prevented a positive identification on the second column
- P The analyte was detected on both chromatographic columns but the quantified values differ by $\geq 40\%$ RPD with no obvious chromatographic interference

Geotechnical Data

- A The total of all fines fractions. This flag is used to report total fines when only sieve analysis is requested and balances total grain size with sample weight.
- F Samples were frozen prior to particle size determination
- SM Sample matrix was not appropriate for the requested analysis. This normally refers to samples contaminated with an organic product that interferes with the sieving process and/or moisture content, porosity and saturation calculations
- SS Sample did not contain the proportion of "fines" required to perform the pipette portion of the grain size analysis
- W Weight of sample in some pipette aliquots was below the level required for accurate weighting

Dear Will:

Please find enclosed the original *Chain of Custody* (COC) record and final data package for the project referenced above.

Sample receipt information and analytical details are addressed in the *Case Narrative*.

Copies of the reports and all associated raw data will be kept on file at ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,
ANALYTICAL RESOURCES, INC.

RE: Boeing Plant 2 Source Control (Additional Memo)
ARI ID: OY07

Dear Will:

On May 22, 2009, data package OY07 was submitted to Golder Associates Inc. (Golder). During review, Golder noted that the wet and dry weights recorded for filter bag sample **PL2SC-SS-B-050709** resulted in an unusually low water loss percentage upon drying. Suspecting that the filter bag dry weight may have been recorded incorrectly, Golder informed ARI of the anomaly. ARI made every attempt to verify the suspected error, but the entire filter bag had been consumed during the analysis. The analyst could not recall an error and the suspect notes are the only existing documentation.

ARI compared the water loss percentage for this sample to other round 3 filter bag samples (see attached spreadsheet); the comparison indicated that the original data package is likely in error, and that the true dry weight was not 675 g, but 175 g. In addition, Golder calculated the estimated PCB concentration using both dry weight values; a dry weight of 175 g results in a higher estimated PCB concentration than the 675 g value reported (1137 ug/kg vs 0.147 ug/kg), and is thus more conservative.

ARI believes that the dry weight, as originally reported (675 g), is incorrect, and should be corrected to the lower weight (175 g), making it consistent with all previously reported filter bag samples.

Copies of the reports and all associated raw data will be kept on file at ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,
ANALYTICAL RESOURCES, INC.

Limits of Liability: ARI will perform all requested services in accordance with appropriate methodology following ARI Standard Operating Procedures and the ARI Quality Assurance Program. This program meets standards for the industry. The total liability of ARI, its officers, agents, employees, or successors, arising out of or in connection with the requested services, shall not exceed the invoiced amount for said services. The acceptance by the client of a proposal for services by ARI release ARI from any liability in excess thereof, not withstanding any provision to the contrary in any contract, purchase order or co-signed agreement between ARI and the Client.

Sample Retention Policy: All samples submitted to ARI will be appropriately discarded no sooner than 90 days after receipt or 60 days after submission of hardcopy data, whichever is longer, unless alternate retention schedules have been established by work-order or contract.

Cooler Receipt Form

ARI Client: Boeing
COC No(s): _____ (NA)
Assigned ARI Job No: 0107

Project Name: Stormwater Source Control
Delivered by: Fed-Ex UPS Courier (Hand) Delivered Other: _____
Tracking No: _____ (NA)

Preliminary Examination Phase:

Were intact, properly signed and dated custody seals attached to the outside of to cooler? YES (NO)
Were custody papers included with the cooler? (YES) NO
Were custody papers properly filled out (ink, signed, etc.) (YES) NO
Temperature of Cooler(s) (°C) (recommended 2.0-6.0 °C for chemistry)..... AMB _____
If cooler temperature is out of compliance fill out form 00070F Temp Gun ID#: 1

Cooler Accepted by: AV Date: 5/7/09 Time: 1015

Complete custody forms and attach all shipping documents

Log-In Phase:

Was a temperature blank included in the cooler? YES (NO)
What kind of packing material was used? ... Bubble Wrap Wet Ice Gel Packs Baggies Foam Block Paper Other: trash bag
Was sufficient ice used (if appropriate)? NA YES (NO)
Were all bottles sealed in individual plastic bags? (YES) NO
Did all bottles arrive in good condition (unbroken)? (YES) NO
Were all bottle labels complete and legible? (YES) NO
Did the number of containers listed on COC match with the number of containers received? (YES) NO
Did all bottle labels and tags agree with custody papers? (YES) NO
Were all bottles used correct for the requested analyses? (YES) NO
Do any of the analyses (bottles) require preservation? (attach preservation sheet, excluding VOCs)... NA YES (NO)
Were all VOC vials free of air bubbles? (NA) YES NO
Was sufficient amount of sample sent in each bottle? (YES) NO

Samples Logged by: JH Date: 5/7/09 Time: 1215

Project: Stormwater Source Control

ARI JOB NO: OY07

prepared
by

Analytical Resources, Inc.

**Case Narrative****Project: Boeing Plant 2 Source Control****ARI ID: OY07****Matrix: Filter Bag / Soil****Date: May 21, 2009****Sample Receipt Information**

Two solid matrix samples were received in good condition at ARI on 05/7/09 under ARI sample delivery group OY07. One cooler arrived at an ambient temperature.

Select samples were analyzed for the parameters listed below, as requested on the COC.

PCBs by Method 8082:

The sample was extracted on 5/11/09 and analyzed on 5/13/09 within the method recommended holding times.

Initial calibration (s): All analytes of interest were within method acceptance criteria.

Continuing calibration (s): Are in control.

Samples: There were no anomalies associated with these samples.

Surrogates: All surrogate recoveries were in control.

LCS(s): All percent recoveries for the analytes of interest were within compliance.

Method Blank: The method blank was free of contamination.

Total Metals by Methods 6010B and 7000 series

The samples were digested between 5/11/09 and 5/13/09. The digests were analyzed between 5/12/09 and 5/18/09 within the method recommended holding times.

Initial calibration (s): The initial CRI is out of control high for Copper. The sample concentrations were greater than ten times the RL and the trailing CRI was in control. All other analytes of interest were within method acceptance criteria and no further corrective action was taken.

Continuing calibration (s): Are in control.

Samples: No anomalies were encountered for these samples.

LCS/Blank Spike(s): All percent recoveries were within compliance.

Method Blank(s): Are in control.

Standard Reference: All percent recoveries were within compliance.

ARI Job No.: 0Y07

Client ID: The Boeing Company

Parameter: PCB

Client Project: Stormwater Source Control

SOP Number(s): 3545

No Anomalies:

List problems, concerns, corrective actions and any other pertinent information

Sample 'A' is prep only as per project Manager. JA 5/8/09

'A' wet weight = 679.22g

'A' Metals split = 5.15g

'A' dry weight w/ Plastic Ring = 172.02

'A' - Plastic Ring weight = 8.43

'A' dry weight without Plastic Ring = ~~150.45~~ ^{JA} 163.59g

'B' wet weight = 681.24g

'B' Metals Split = 5.04g

'B' dry weight w/ Plastic Ring = 675.90

'B' Plastic Ring weight = 8.36

'B' ^{JA}plast dry weight without Plastic Ring = 667.54

Sample 'A' was weighed, then archived. JA 5/11/09

Added 5X Normal Surrogate level to Sample 'B' to leave room for dilutions as per Josh R. JA 5/11/09

Analyst Initials: Date:

Data Reporting Qualifiers

Effective 12/28/04

Inorganic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Duplicate RPD is not within established control limits
- B Reported value is less than the CRDL but \geq the Reporting Limit
- N Matrix Spike recovery not within established control limits
- NA Not Applicable, analyte not spiked
- H The natural concentration of the spiked element is so much greater than the concentration spiked that an accurate determination of spike recovery is not possible
- L Analyte concentration is ≤ 5 times the Reporting Limit and the replicate control limit defaults to ± 1 RL instead of the normal 20% RPD

Organic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Flagged value is not within established control limits
- B Analyte detected in an associated Method Blank at a concentration greater than one-half of ARI's Reporting Limit or 5% of the regulatory limit or 5% of the analyte concentration in the sample.
- J Estimated concentration when the value is less than ARI's established reporting limits
- D The spiked compound was not detected due to sample extract dilution
- NR Spiked compound recovery is not reported due to chromatographic interference
- E Estimated concentration calculated for an analyte response above the valid instrument calibration range. A dilution is required to obtain an accurate quantification of the analyte.
- S Indicates an analyte response that has saturated the detector. The calculated concentration is not valid; a dilution is required to obtain valid quantification of the analyte
- NA The flagged analyte was not analyzed for

- NS The flagged analyte was not spiked into the sample.
- M Estimated value for an analyte detected and confirmed by an analyst but with low spectral match parameters. This flag is used only for GC-MS analyses.
- M2 The sample contains PCB congeners that do not match any standard Aroclor pattern. The PCBs are identified and quantified as the Aroclor whose pattern most closely matches that of the sample. The reported value is an estimate.
- N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification".
- Y The analyte is not detected at or above the reported concentration. The reporting limit is raised due to chromatographic interference. The Y flag is equivalent to the U flag with a raised reporting limit.
- C The analyte was positively identified on only one of two chromatographic columns. Chromatographic interference prevented a positive identification on the second column.
- P The analyte was detected on both chromatographic columns but the quantified values differ by $\geq 40\%$ RPD with no obvious chromatographic interference.

Geotechnical Data

- A The total of all fines fractions. This flag is used to report total fines when only sieve analysis is requested and balances total grain size with sample weight.
- F Samples were frozen prior to particle size determination.
- SM Sample matrix was not appropriate for the requested analysis. This normally refers to samples contaminated with an organic product that interferes with the sieving process and/or moisture content, porosity and saturation calculations.
- SS Sample did not contain the proportion of "fines" required to perform the pipette portion of the grain size analysis.
- W Weight of sample in some pipette aliquots was below the level required for accurate weighting.

1. INTRODUCTION

A total of eight stormwater samples including a field duplicate, seven filter bag samples, and nine equipment blank samples were collected November 2008 through May of 2009. This sampling was conducted as part of the 1994 Administrative Order on Consent between Boeing and EPA Region X and details are specified in the *Revised Stormwater Source Control Work Plan – Attachment A – Sampling and Analysis Plan* (Golder and Floyd| Snider, 2007). The purpose of the stormwater sampling is to identify potential sources and extent of contamination to the Duwamish Waterway. Samples were analyzed by Analytical Resources Incorporated (ARI) of Tukwila, Washington for the following parameters:

- Semivolatile organic compounds (SVOC) by EPA Method 8270D GC/MS
- Polynuclear Aromatic Hydrocarbons (PNAs) by EPA Method 8270D GC/MS SIM
- Polychlorinated biphenyls (PCBs) by EPA Method 8082
- Metals (Arsenic, Cadmium, Chromium, Copper, Mercury, Lead, Silver, and Zinc) by EPA Methods 6010B, 7000 Series, and 200.8.
- pH by EPA Method 150.1.

Samples were analyzed in accordance with procedures described in *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods (USEPA SW-846, 3rd edition) 8270D, 8270D-SIM, 8082, 6010B, 7060, 7421, 7470, and EPA Method 200.8, Revision 5.5; Determination of Trace Elements in Water and Wastes by Inductively Coupled Plasma-Mass Spectrometry.*

2. SAMPLE DELIVERY GROUPS, SAMPLES, AND ANALYSES

Samples were analyzed and results reported by the laboratory in batch numbers as summarized below:

NZ46/NZ56 (PCBs and Dissolved Metals):

PL2SC-EB1-111108 PL2SC-EB2-111108

OB32/OB33 (Dissolved Metals):

PL2SC-W-I-112008

OB37/OB38 (PCBs and Dissolved Metals):

PL2SC-EB3-112108

OC61/OC62 (PCBs, Total and Dissolved Metals):

sampled for metals)

Quality assurance/quality control (QA/QC) reviews of laboratory data were performed in the laboratory in accordance with the laboratory quality assurance program plan. The data validation QA/QC review focused primarily on laboratory result summary sheets and quality control summary sheets to ensure that work plan data quality objectives were met for the project. Data validation was conducted in accordance with the criteria outlined in the National Functional Guidelines for Organic Data Review (EPA 1999) and the National Functional Guidelines for Inorganic Data Review (EPA 2004), modified to include method specific requirements of the laboratory analytical methods. Raw data sheets were reviewed as necessary to confirm conditions reported and to support application of qualifiers to analytical results.

The validation level specified in the *Revised Stormwater Source Control Work Plan – Attachment A - Sampling and Analysis Plan (SAP)* is a Level 1 which is considered a basic review. Level 2, a more detailed (per SAP Tables 4-7) validation was performed per Golder's request (April 4, 2007). The following is a summary of quality control elements associated with each analytical fraction and the status of that element as a result of the data validation process.

3. SAMPLING, DOCUMENTATION AND REPORTING

- It was noted during review of the *Revised Stormwater Source Control Work Plan – Attachment A - Sampling and Analysis Plan (SAP)* that various compounds were not analyzed or did not meet requested reporting limits for SVOCs and PNAs. In some cases action levels were set to the laboratory reporting limit (RL) as laboratory RLs were greater than National Recommended Water Quality Criteria for Priority Toxic Pollutants (NRWQC) criteria.
- Table 7 of the SAP specifies that ARI sufficiently demonstrate analyst capability and method detection limit (MDL) studies for EPA Methods 8270D and 8270D SIM. ARI's Laboratory Quality Assurance Plan (LQAP) specifies standard operating procedures and other elements of ARI's training program. Internal and/or external performance evaluation samples are used periodically to assess staff competency. Unacceptable results or insufficient number of performance evaluation samples will result in remedial or additional training as specified in ARI's LQAP. ARI MDL studies are performed and calculated in accordance with 40 CFR Part 136, Appendix B and are periodically updated as necessary and/or according to regulatory requirements.
- All SDGs: Recorded cooler temperatures occasionally exceeded the recommended temperature ($4^{\circ}\text{C} \pm 2^{\circ}\text{C}$) for sample preservation. No action was taken since the samples are delivered to the laboratory on the same day as sample collection.
- SDGs OC61, OG77, OM42, OR49, OW01, and OY07: Filter bag samples (also referred to as suspended solids) were collected over extended periods of time (1 to 2 week period or longer when necessary) and were "collected" on a given day. Chain of custody date represents the date the filter bag was removed from the system and submitted to the lab. Filter bag samples were analyzed for PCBs and metals.
- All SDGs: In early 2007, due to ongoing zinc contamination within ARI's metals laboratory, zinc reporting level for EPA Method 6010B was revised from $6\ \mu\text{g/L}$ to $10\ \mu\text{g/L}$ ($0.6\ \text{mg/kg}$ to $1\ \text{mg/kg}$ for solids). The revised reporting limit is slightly higher than

- the approved quality assurance project plans. No action was taken as this detection limit is well below the action level of 81 µg/L for water (960 mg/kg for solids).
- Various SDGs: Metal results for water samples are reported with mg/L instead of µg/L units. ARI indicates that this due to internal reporting procedures and project continuity. Efforts are being made by ARI to ensure consistent reporting. No action was taken other than to alert the data user.
 - SDGs NZ56, OB33, OB38, OC62, OG57, OG74, OH86, ON53, OO10, OO87, OP51, OS61, and OS79: Refer to these SDGs for dissolved mercury results.
 - SDG NZ46/NZ56: Equipment blank (PL2SC-EB1-111108) does not correspond to any samples. Sampler was found covered with an oily substance in the catch basin shortly after setup, was dismantled and re-built once the location (18-249) was cleaned (comm. with L. Shea). Equipment blank (PL2SC-EB2-111108) corresponds to samples in SDGs OB32/OB33 and OC61 (water and filter bag samples, respectively).
 - SDG OB37/OB38: Equipment blank (PL2SC-EB3-112108) corresponds to samples in SDGs OG70/OG74 and OG77 (water and filter bag samples, respectively).
 - SDG OC61/OC62: Equipment blank (PL2SC-EB2-120308) corresponds to samples in SDGs OS73/OS79 and OW01 (water and filter bag samples, respectively).
 - SDGs OG55/OG57: Equipment blanks are not associated with these samples as they were collected by hand or peristaltic pump with dedicated tubing.
 - SDG OH84/OH86: Equipment blank (PL2SC-EB1-011309) corresponds to samples in SDGs OO10/OO11 and OM42 (water and filter bag samples, respectively). Equipment blank (PL2SC-EB3-011309) does not correspond to any samples. Results for this equipment blank necessitated cleaning of the equipment and resampling based on Cu and Zn detects.
 - SDG ON49/ON53: Equipment blank (PL2SC-EB3-021909) corresponds to samples in SDGs OS73/OS79 and OY07 (water and filter bag samples, respectively). This equipment blank is the new one collected after the Cu and Zn detects found in the equipment blank from SDG OH84/OH86.
 - SDG OO85/OO87: Equipment blank (PL2SC-EB1-022709) corresponds to samples in SDGs OP48/OP51 and OR49 (water and filter bag samples, respectively).
 - SDG OS60/OS61: Equipment blank (PL2SC-EB1-032709) corresponds to samples in SDG OY07 (filter bag sample).
 - SDG OB32/OB33: Upon sample receipt, it was noted that there was a sample ID discrepancy between the Mercury bottle and the chain of custody: the bottle said 'PL2CS' while the chain of custody stated 'PL2SC'. ARI resolved the discrepancy to 'PL2SC'.

- SDG OO85/OO87: There was a note from ARI on the chain of custody about a sample ID discrepancy. The lab had resolved a sample time discrepancy on sample PL2SC-W-J249-022309 of 1630 versus 1130. The correct time was 1130.
- SDG OO85/OO87: A filter bag PL2SC-SS-J249-022309 was submitted but put on hold. The Golder project manager cancelled analysis of this sample because a filter bag was taken from the same location (in SDG OM42) before a water sample was collected. The filter bag was collected before the water sample because the filter bag had become clogged. As a result, a new filter bag (submitted in this SDG, but not analyzed) was placed in the sampler in order to collect a water sample during the subsequent wet event (comm. with L. Shea).
- SDG OR49: The sample ID was listed incorrectly on the chain of custody as PL2SC-SS-A-030509. It was changed by Golder to PL2SC-SS-A-031909 upon receipt.
- SDG OR49: PCB analysis was requested erroneously according to the work plan and analyzed before it was noticed by Golder. Boeing was notified of the discrepancy. Also, there was not enough volume for metals analysis, so the sampling apparatus had to be set up again and a new filter bag collected as part of SDG OY07.
- SDGs OG55 and OB70: pH analysis was requested for the samples submitted for these SDGs since the field meter was not in working order on the day of sample collection. The DV performed a cursory review of the sample results and found that transcriptions, holding times, and associated QC were in control. The only item of note is that sample PL2SC-W-DUP-010609 on SDG OG55 was not analyzed as requested. The Golder project manager was contacted and it was observed that normally, in the field, a duplicate sample would not have a second pH reading taken when the sample was collected. No further action was required.
- SDG OY07: The lab reports PCB data as Total μg and does not incorporate the moisture content or sample weight in the data package. Upon receipt of the data, Golder calculates the concentration of PCBs in $\mu\text{g}/\text{kg}$ -solids based on handwritten filter bag wet and dry weight data provided by the laboratory. For sample PL2SC-SS-B-050709, the filter bag “dry weight” and “dry weight without plastic ring” were reported as 675.90 g and 667.54 g, respectively. The wet weight was reported as 681.20 g, resulting in a water loss value of 0.04 %. This value was inconsistent with historical water losses (ranging from 65 to 74%). The lab was contacted to confirm these values since a wet weight of 175.90 g and 167.54 g would be more consistent with historical values. The lab agreed with the suspicion, but had no way of verifying this, as the analysis was over and the filter bag had been consumed. Unfortunately, the dry weight value is required to calculate the PCB concentration in the bag. As a result, ARI provided a letter explaining the situation and recommending the use of 175.90g and 167.54 g for the “dry weight” and “dry weight without plastic ring” values. The letter is attached within Attachment B of the final report to be submitted to the EPA.
- It should be noted that field duplicates were not collected for suspended solids since filter bag samples are collected over an extended time period making collection impossible.

4. SEMIVOLATILE ORGANIC COMPOUNDS

The laboratory provided a full data package for the SVOC analyses, the items reviewed during validation are summarized below.

4.1 Analytical Methods – *acceptable*

Samples for SVOC analysis were analyzed by gas chromatography/mass spectrometry (GC/MS) using EPA SW846 Method 8270D.

4.2 Sample Holding Times – *acceptable*

All samples were extracted within 7 days for waters of sample collection and analyzed within 40 days from extraction to analysis.

4.3 Laboratory Reporting Limits

The laboratory achieved the reporting limits (RLs) required by the approved SAP (Golder and Floyd|Snider, 2007) with the following exceptions:

- SDG OG55: Thirteen target compounds: aniline, azobenzene, benzidine, 1,4-dioxane, retene, tributyl phosphate, triphenyl phosphate, alpha-terpineol, butyl diphenyl phosphate, butylatedhydroxytoluene, dibutyl phenyl phosphate, pyridine, and n-nitrosodimethylamine were not analyzed for as requested on Table 3 of the SAP.
- SDG OG55: Water reporting limits for target compounds 2,4,6-trichlorophenol, 2,4-dinitrotoluene, 3,3'-dichlorobenzidine, bis-(2-chloroethyl)ether, hexachlorobenzene, nitroso-di-n-propylamine, and pentachlorophenol were higher (by a factor of 10X) than requested because they were analyzed via GC/MS instead of GC/MS SIM as requested on Table 3 of the SAP. For these 8 compounds, the action levels are less than the RLs:

Compound	SAP Reporting Limit (µg/L)	OG55 Reporting Limit (µg/L)	Action Level (µg/L)
2,4,6-trichlorophenol	0.5	5	2.4
2,4-dinitrotoluene	0.5	5	3.4
3,3'-dichlorobenzidine	0.5	5	0.5
bis-(2-chloroethyl)ether	0.1	1	0.53
hexachlorobenzene	0.1	1	0.1
nitroso-di-n-propylamine	0.5	5	0.51
pentachlorophenol	0.5	5	3

4.4 Instrument Calibration and Tuning

A review of the instrument calibration, calibration frequency, and tuning was performed. All of the calibration criteria for the target analytes, as listed on Table 7 of the SAP, were met with the following exceptions:

Sample	Compound	Qualification	Reason
OG55 PL2SC-W-G-010609	Benzoic Acid	UR/J	ICAL R ² < 0.995.

4.5 Internal Standards Recovery - *acceptable*

Internal standard areas and retention times for all field samples, associated quality control, and calibration data were within established quality control limits.

4.6 Blank Contamination – *acceptable*

The method blanks were free of contamination.

4.7 Surrogate Recovery – *acceptable*

All surrogate recoveries were within control limits with the following exceptions:

4.8 Matrix Spike Compound Recovery – *acceptable*

Matrix Spike/Matrix Spike Duplicate (MS/MSD) analyses were not performed. Refer to LCS/LCSD results for a measure of precision and accuracy.

4.9 Laboratory Control Sample Recovery – *acceptable*

Laboratory control/laboratory control duplicate samples (LCS/LCSD) were evaluated using ARI control limits. LCS/LCSD % recoveries and RPD were acceptable and within specified criteria.

4.10 Field Duplicate Sample Analysis

Field duplicate samples were not collected and analyzed for SVOCs due to reasons (limited volume and high variability) described in the approved SAP Section 3.1.4.

5. POLYNUCLEAR AROMATICS

The laboratory provided a full data package for the PNA analyses, the items reviewed during validation are summarized below.

5.1 Analytical Methods – *acceptable*

Samples for PNA analysis were analyzed by selected ion monitoring (SIM) gas chromatography/mass spectrometry (GC/MS) using EPA SW846 Method 8270D SIM.

5.2 Sample Holding Times – *acceptable*

All samples were extracted within 7 days for waters (14 for soils) of sample collection and analyzed within 40 days from collection to analysis.

5.3 Laboratory Reporting Limits

The laboratory achieved the reporting limits (RLs) required by the approved SAP (Golder and Floyd|Snider, 2007) with the following exceptions:

- SDG OG55: Nine target compounds 2,4,6-trichlorophenol, 2,4-dinitrotoluene, 3,3'-dichlorobenzidine, benzidine, bis-(2-chloroethyl)ether, hexachlorobenzene, n-nitrosodimethylamine, nitroso-di-n-propylamine, and pentachlorophenol were not

analyzed via EPA Method 8270D SIM as stipulated on Table 3 of the SAP. Seven of the nine target compounds listed above were analyzed by EPA Method 8270D, but the requested reporting limits were not met (see section 4.3 above for details). The remaining two target compounds (benzidine and n-nitrosodimethylamine) were not analyzed by the lab (see section 4.3 above). No action required since these compounds are not analyzed by 8270D SIM, thus the method was listed incorrectly in the SAP.

- SDG OY07: LCSD percent recovery was out of control and greater than the work plan control limits of 50-130%. No action was necessary since the ARI control limits have been updated since the work plan was written.

5.4 Instrument Calibration and Tuning – *acceptable*

A review of the instrument calibration, calibration frequency, and tuning was performed. All of the calibration criteria for the target analytes, as listed on Table 7 of the SAP, were met.

5.5 Internal Standards Recovery – *acceptable*

Internal standard areas and retention times for all field samples, associated quality control, and calibration data were within established quality control limits.

5.6 Blank Contamination – *acceptable*

The method blanks were free of contamination.

5.7 Surrogate Recovery – *acceptable*

All surrogate recoveries were within control limits.

5.8 Matrix Spike Compound Recovery – *acceptable*

Matrix Spike/Matrix Spike Duplicate (MS/MSD) analyses were not performed. Refer to LCS/LCSD results for a measure of precision and accuracy.

5.9 Laboratory Control Sample Recovery – *acceptable*

Laboratory control/laboratory control duplicate samples (LCS/LCSD) were evaluated using ARI control limits. LCS/LCSD % recoveries and RPD were acceptable and within specified criteria.

5.10 Internal Standards Recovery – *acceptable*

Internal standard areas and retention times for all field samples, associated quality control, and calibration data were within established quality control limits.

5.11 Field Duplicate Sample Analysis

Field duplicate samples were not collected and analyzed for PNAs due to reasons (limited volume and high variability) described in the approved SAP Section 3.1.4.

6. POLYCHLORINATED BIPHENYLS

The laboratory provided a full data package for the PCB analysis and the items reviewed during validation are summarized below.

6.1 Analytical Methods – *acceptable*

Samples for PCB analysis were analyzed by gas chromatography/mass spectrometry (GC/MS) using EPA SW846 Method 8082.

6.2 Sample Holding Times – *acceptable*

All samples were prepared and analyzed within 14 days of sample collection (soil samples) or within 7 days of sample collection (water samples).

6.3 Reporting

The following sampling, documentation, and reporting discrepancies are noted:

- Analyst notes indicated that a large volume of acid was necessary to perform cleanup on filter bag samples. No further action was required other than to note.

6.4 Laboratory Reporting Limits – *acceptable*

The laboratory achieved the reporting limits (RLs) required by the approved SAP (Golder and Floyd|Snider, 2007).

The reporting limits were not met in cases in which the samples were analyzed at dilutions due to high concentrations of target compounds. No action was taken.

6.5 Instrument Calibration – *acceptable*

A review of the instrument calibration was performed. All of the calibration criteria were met. It should be noted that the approved SAP (Golder and Floyd|Snider, 2007) indicates that continuing calibration verification should be performed every six samples and at the end of the analytical sequence. While USEPA Method 8082 (December 1996) *recommends* that a calibration standard be performed after each group of 10 samples the method *requires* that a calibration standard must be analyzed after each group of 20 samples. Calibration standard analysis frequency was performed according to USEPA Method 8082 criteria.

6.6 Internal Standards Recovery – *acceptable*

Internal standard areas and retention times for all field samples, associated quality control, and calibration data were within established quality control limits.

6.7 Blank Contamination – *acceptable*

The method blanks and associated equipment blanks were free of target compounds.

6.8 Surrogate Recovery

All surrogate recoveries were within control limits except for the following:

- SDG OC61: PCB surrogate % recoveries for Sample PL2SC-SS-I-120308 were “diluted out” due to sample matrix interference and subsequent dilution. No action was taken on this basis. Method blank and laboratory control sample surrogate recoveries are acceptable.
- SDG OG77: PCB surrogate % recoveries (PL2SC-SS-Z-010809) were “diluted out” due to sample matrix interference and subsequent dilution. No action was taken on this basis. Method blank and laboratory control sample surrogate recoveries are acceptable.
- SDG OM42: PCB surrogate % recoveries (PL2SC-SS-J249-021209) were “diluted out” due to sample matrix interference and subsequent dilution. No action was taken on this basis. Method blank and laboratory control sample surrogate recoveries are acceptable.
- SDG OW01: PCB surrogate % recoveries (PL2SC-SS-J505-041709) were “diluted out” due to sample matrix interference and subsequent dilution. No action was taken on this basis. Method blank and laboratory control sample surrogate recoveries are acceptable.

6.9 Matrix Spike Compound Recovery – *acceptable*

Matrix Spike/Matrix Spike Duplicate (MS/MSD) analyses were not performed on suspended solids and stormwater due to reasons (limited volume and high variability) described in the approved SAP Section 3.1.4. Refer to LCS/LCSD results for a measure of precision and accuracy.

6.10 Laboratory Control Sample Recovery – *acceptable*

Laboratory control samples (LCS) were evaluated using ARI’s control limit criteria. It should be noted that Table 4 of the SAP specifies PCB acceptance criteria for solids. ARI control limit criteria are as stringent if not more stringent than limits specified in Table 4. LCS/LCSD % recoveries and RPD were acceptable and within specified criteria.

6.11 Field Duplicate Sample Analysis

Field duplicate samples were not collected and analyzed for PCBs due to reasons (limited volume and high variability) described in the approved SAP Section 3.1.4.

7. INORGANICS

The laboratory provided a full data package for the inorganic analysis; the items reviewed during validation are summarized below.

7.1 Analytical Methods – *acceptable*

Samples for total and dissolved metals analysis were prepared using EPA Methods 3010A, 3050B, 7000A, 200.8, or acid digestion. Metals analysis was completed by EPA Methods 6010B, 7000 Series, and 200.8. Samples for trace mercury analysis were prepared and analyzed by cold vapor atomic absorption spectrometry (CVAA) using EPA Method 7470A.

7.2 Sample Holding Times – *acceptable*

All samples were prepared and analyzed within the recommended holding period from the date of collection; 180 days for metals and 28 days for mercury. All holding time criteria were met.

7.3 Laboratory Reporting Limits

The laboratory achieved the reporting limits (RLs) required by the approved SAP (Golder and Floyd|Snider, 2007) with the following discussion:

- In early 2007, due to ongoing zinc contamination within ARI’s metals laboratory, zinc reporting level for EPA Method 6010B was revised from 6 µg/L to 10 µg/L (0.6 mg/kg to 1 mg/kg for solids). The revised reporting limit is slightly higher than the approved quality assurance project plans. No action was taken.
- The reporting limits were not met in cases in which the samples were analyzed at dilutions due to high concentrations of target compounds or interferences. No action was taken.

7.4 Initial and Continuing Calibration Verification – *acceptable*

All initial calibration, initial calibration verification (ICV) and continuing calibration verification (CCV) sample analysis results for total and dissolved metals analyses were within 10% of the initial calibration. CCV samples were performed every 10 samples and at the end of an analytical sequence. Instrumental precision criteria as specified on SAP Tables 5 and 6 were met.

7.5 Blank Contamination

The equipment, method, and continuing calibration blanks were free of target compounds with the following exceptions and discussion:

Samples	Analyte	Qualification
OB32 PL2SC-W-I-112008	Zn (60 µg/L)	J+ – Elevated (estimated) result due to equipment blank contamination (SDG NZ46 – 10 µg/L)
OO10 PL2SC-W-J249-022309	Cu (8 µg/L)	J+ – Elevated (estimated) result due to equipment blank contamination (SDG OH84 – 3 µg/L)
OS79 PL2SC-W-J505-032809	Cu (10 µg/L)	J+ – Elevated (estimated) result due to equipment blank contamination (SDG OC61 – 9 µg/L)

Early 2007 ARI had some ongoing zinc contamination within their metals laboratory thus zinc was analyzed via EPA Method 200.8 instead of EPA Method 6010B. Zinc reporting limits for EPA Method 200.8 are less than EPA Method 6010B reporting limit of 6 µg/L (historical reporting limit) at 4 µg/L. ARI resolved the internal zinc contamination and effective March 4, 2007 EPA Method 6010B reporting limit for zinc is 10 µg/L (Method Detection Limit and Reporting Limit Summary for ICP-OES). No action was taken other than to note this.

7.6 Laboratory Control Sample Recovery – *acceptable*

LCS (blank spike) samples were performed with each analytical batch. All LCS recoveries and relative percent differences (RPDs) were acceptable and within the QC limits of 80 to 120 percent.

7.7 Matrix Spike/Matrix Spike Duplicate Analysis – *acceptable*

Matrix Spike (MS) analysis was performed on selected stormwater and suspended solid samples. Blank spike data was used to assess accuracy in cases where matrix spike quality control was not performed (in most cases due to limited sample volume) by ARI. The metals MS percent recoveries were acceptable.

7.8 Duplicate Analysis – *acceptable*

Laboratory duplicate analysis was performed on selected water and suspended solid samples. Field duplicate data was used to assess precision on water samples associated with SDG OG55/OG57. Laboratory duplicate analysis was not performed on the remaining SDGs for a number of reasons which include a) precision analysis was unnecessary on SDGs where the sole sample was an equipment blank or b) limited sample volume. Duplicate analysis criteria were met with the following exceptions:

- SDG OG55: Copper sample and laboratory duplicate (PL2SC-W-V-010609) results were 4 and 3 µg/, with an RPD of 28.6%. No qualifier is necessary due to samples being < 5X the RL and there is higher variability at lower concentrations.
- SDG OG55: Copper sample and field duplicate (PL2SC-W-V-010609 and PL2SC-W-DUP-010609) results were 4 and 3 µg/L, with an RPD of 28.6%. No qualifier is necessary due to samples being < 5X the RL.
- SDG OG55: Arsenic sample and field duplicate (PL2SC-W-V-010609 and PL2SC-W-DUP-010609) results were 2 and 1 µg/L, with an RPD of 66.7%. No qualifier is necessary due to samples being < 5X the RL.

7.9 Interference Check Sample Analysis – *acceptable*

All interference check sample analysis results for total metals were within 20% of the true value, analyzed at the appropriate frequencies.

7.10 Linear Range Check Standard – *acceptable*

The linear range check standard analyzed for ICP analyses was within ±10%.

7.11 ICP Serial Dilution Analysis – *acceptable*

All serial dilution results were less than 10% difference between the initial and final results and less than 50 times the sample IDL.

7.12 Internal Standard Analysis

Internal standard recoveries for metals were not assessed in part because this data is not summarized by ARI (it is not achievable with current LIMS setup) and because this data is only available in the raw data package. If internal standard recovery is outside criteria the laboratory

follows standard operating procedures (consistent with the referenced method) to identify and address the issue. Typically steps include flushing the instrument with a rinse blank followed by analyzing a calibration blank to assess internal standard responses, and based on these results (determining that instrument drift isn't occurring) reanalyzing the sample at a dilution. Since associated quality control was within criteria an assessment of internal standards is not necessary for a Level 1 review.

7.13 Field Duplicate Sample Analysis – *acceptable*

Field duplicate sample pair is as follows:

Laboratory SDG	Sample	Field Duplicate Sample
OG55/OG57	PL2SC-W-V-010609	PL2SC-W-DUP-010609

Work plan goals for precision were met for dissolved metals. See further discussion in section 7.8 above.

8. DATA QUALIFIERS

Data qualifiers applied by the laboratory have been removed from the data summary report sheets and superseded by data validation qualifiers as follows:

The following qualifiers were used to modify the data quality and usefulness of individual analytical results.

- U – The constituent was analyzed for, but was not detected above the reported sample quantitation limit.
- J – The constituent was positively identified and detected; however, the concentration reported is an estimated value because the result is less than the quantitation limit or quality control criteria were not met.
- J+ – The result is an estimated quantity, but the result may be biased high.
- UJ – The constituent was not detected; the associated quantitation limit is an estimated value because quality control criteria were not met.
- R – Data are rejected due to significant exceedance of quality control criteria. The analyte may or may not be present. Additional sampling and analysis may be required to determine the presence or absence of the constituent. For statistical reasons, rejected values are not included in the database.
- UY – PCB Methods Only. The laboratory uses the Y qualifier when interferences (usually the presence of the overlapping PCB Aroclor at high concentrations) cause the detection limit to be raised. The Y-flagged Aroclor may be present at concentrations less than equal to the limit reported, but in the opinion of the analyst, insufficient information is present to confirm the detection according to the method's protocols. The concentration should be treated as a non-detected value at a raised detection limit. The "U" has been added to the lab's "Y" qualifier to stress that the sample should be treated as a non-detected value. The reporting limit is elevated due to interference. The result is not detected.

9. DATA ASSESSMENT

Data review and validation was performed by an experienced quality assurance chemist independent of the analytical laboratory and not directly involved in the project. This is to certify that I have examined the analytical data and based on the information provided to me by the laboratory, in my professional judgment, the data are acceptable for use except where indicated by data qualifiers, which may modify the usefulness of those individual values.
