Protectiveness Determination for the Pacific Sound Resources Site

The Environmental Protection Agency has completed the third Five-Year Review for the Pacific Sound Resources (PSR) Site on the south shore of Elliott Bay (2130 Harbor Avenue SW, West Seattle). Five-year reviews are done to make sure that the cleanup decisions and actions taken at the site continue to be effective and to protect human health and the environment. ***The results of the recent Five-Year Review show that the PSR Site cleanup of the upland area and the sediment cap in the marine environment continue to protect people and the environment because there is no exposure to people or to the environment from contaminated soil, groundwater or sediment.***

**Work done since the last five-year review**

*More material added to the sediment cap for even greater protectiveness of surface water and aquatic organisms.*

*Opening public access to the beach areas at Jack Block Park.*

*Further data collection and study of sediment and interstitial water on near shore cap areas. Results conclude that the cap placed on marine sediments is working as intended.*

*A no-anchor zone that will protect the sediment cap in Elliott Bay from large anchors that could damage the cap and result in exposure to the marine environment from the contamination below the cap.*
