Hello, my name is Thirstin. I am here  
to talk about protecting and conserving  
**DRINKING WATER.**

Follow me and I'll show you some fun facts  
and activities about water.

Water comes in three different forms:

**LIQUID**

**GAS**

**SOLID**

Water can get dirty, so before we can drink it, it must be clean. Water is cleaned at a Treatment Plant and then sent to our homes through pipes.

**Coagulation:** Dirty water has many particles floating around in it. Alum and other chemicals are added to the water to form floc that is sticky and attracts the dirt into larger clumps. When they get heavy, they sink to the bottom during sedimentation.

**Sedimentation:** The heavy particles settle to the bottom and the clear water at the top moves on to filtration.

**Disinfection:** A small amount of chlorine is added to kill any bacteria or tiny organisms that may be in the water.

**Filtration:** The water goes through filters, often made of sand, gravel and charcoal that will catch even smaller particles that float in the water.

**Storage:** Water is stored in a closed tank (tower) or reservoir so the disinfection can take place. It then goes through pipes and into your home or school.
