I think I'll be out the week of 9/23-27, at least until Wed. due to a funeral in Cincinnati (Pat's uncle) then our Annual Training Conference is Wed-Fri in Raleigh. So by this message I must bow out of our meeting on training on 9/23. I recall we have required a GEP fluid model study for stacks around/near cooling towers but we accept dispersion estimates from emissions from cooling towers using a cooling tower model developed by/at Oak Ridge. I can't, however, recall reviewing any such fluid modeling studies. Seems cooling towers were the issue in a Turkey Point FL power station? Jim
