**Monitoring and Laboratory**  
**Division**

## The Purpose of this Presentation is to:

- Illustrate ICP-MS as a viable technique for PM<sub>2.5</sub> Speciation
- Highlight the benefits of ICP-MS over XRF for PM<sub>2.5</sub> Speciation

# ICP-MS: Principle of Operation

# Ultrasonic Nebulizer and Desolvator

Removes Solvent Interferences

# Sample Input: ICP

---

---

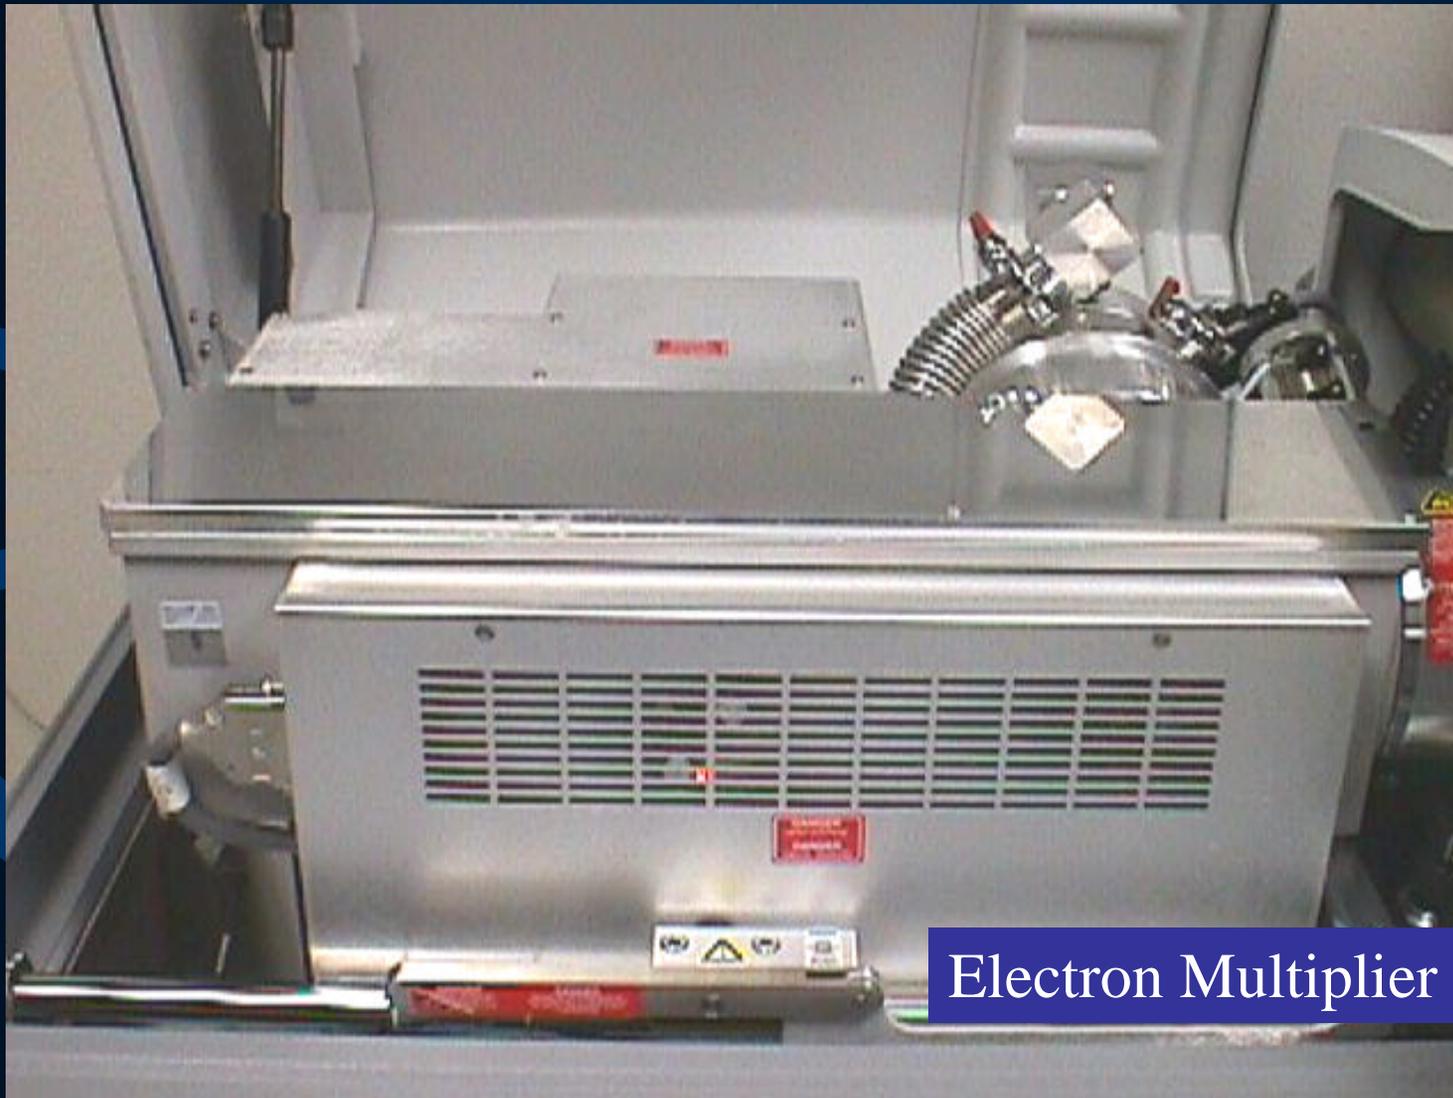

RF Plasma Field

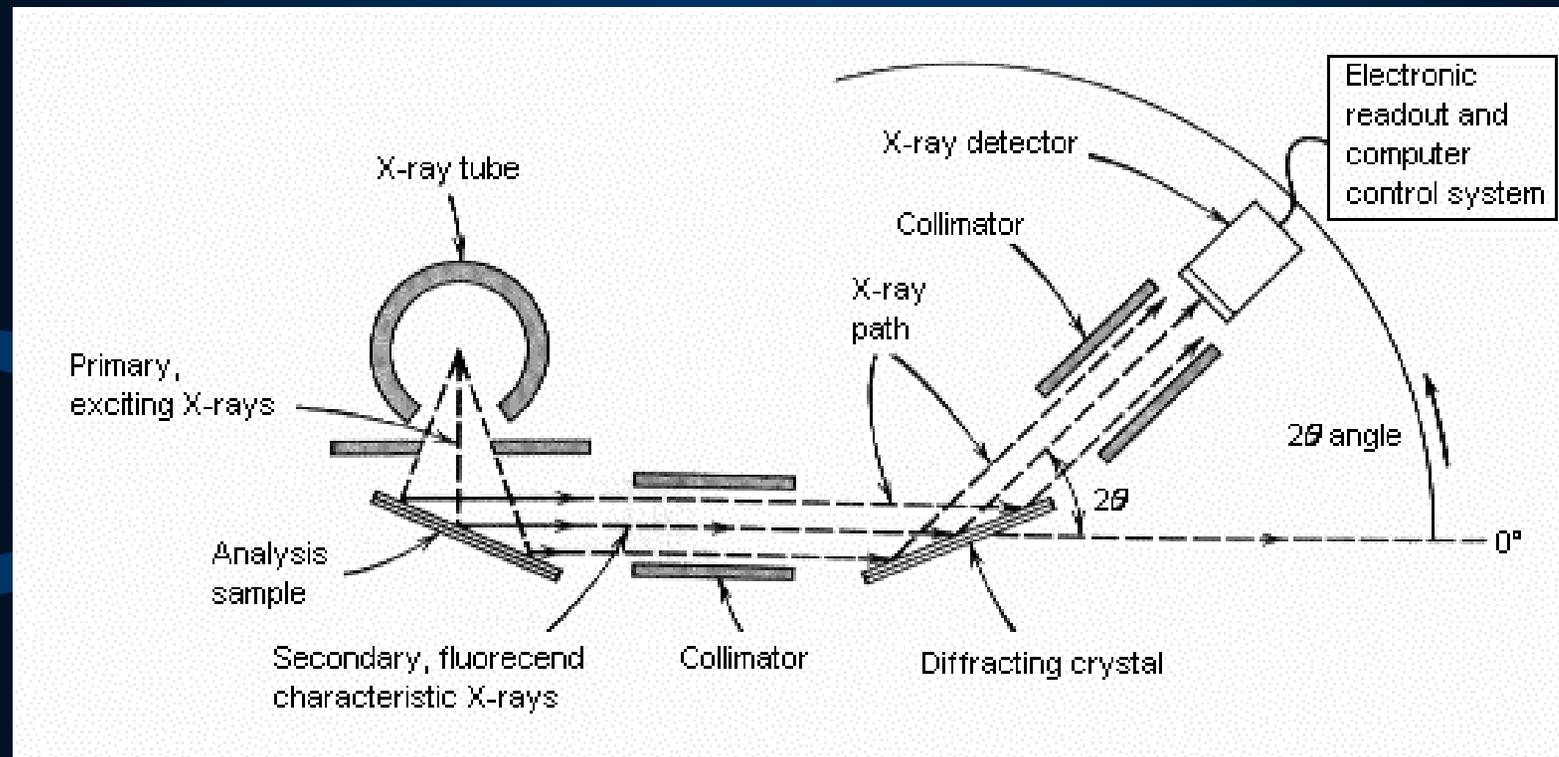

Nebulizer In

# Detection: Mass Spectrometer

Electron Multiplier

# XRF: Principle of Operation

# Sample Preparation:

---

---

- Particulate Extraction:
  - Filters wetted with anhydrous Ethanol (Spectrophotometric Grade).
  - Solubilized in dilute  $\text{HNO}_3$  by sonication with heating.
  - Analyzed directly or after dilution.

# Detection Limits Comparison:

- ICP-MS

– $^{75}\text{As}$	1 ng/m <sup>3</sup>
– $^9\text{Be}$	1 ng/m <sup>3</sup>
– $^{51}\text{V}$	1 ng/m <sup>3</sup>
– $^{39}\text{K}$	5 ng/m <sup>3</sup>
– $^{98}\text{Mo}$	1 ng/m <sup>3</sup>
– $^{28}\text{Si}$	5 ng/m <sup>3</sup>
– $^{44}\text{Ca}$	25 ng/m <sup>3</sup>
– $^{63}\text{Cu}$	1 ng/m <sup>3</sup>

- XRF

– As	2 ng/m <sup>3</sup>
– Be	---
– V	4 ng/m <sup>3</sup>
– K	3 ng/m <sup>3</sup>
– Mo	2 ng/m <sup>3</sup>
– Si	3 ng/m <sup>3</sup>
– Ca	2 ng/m <sup>3</sup>
– Cu	1 ng/m <sup>3</sup>

## Ratio of XRF/ICP-MS (Preliminary Results):

---

---

<u>Analyte</u>	<u>Average Ratio</u>
– <i>Ideal</i>	1.0
– As	1.4
– Be	Undetermined
– V	1.1
– K	1.1
– Mo	< LOD (for both)
– Si	3.7
– Ca	1.0
– Cu	0.8

# Benefits of using ICP-MS for PM<sub>2.5</sub>

## Speciation:

- Source identification from isotopic ratios
  - Fingerprinting of contaminants not possible with XRF.
  - Speciation of Cr (VI) using *EPA Method 6800*.
- Allows monitoring as Analyte levels decrease.
  - Lower overall detection limits than XRF.

# Wrap up:

---

- ICP-MS
  - Isotopic Fingerprinting
  - Low Detection Limits
  - Results Comparable with XRF Analyses
- Recommendation
  - ICP-MS be included as a primary analytical tool for PM<sub>2.5</sub> Speciation.

# Questions, Comments:

---

---
