• Ozone Monitoring Locations	A-1
• PM10 Monitoring Locations	A-2
• Nitrogen Dioxide Monitoring Locations	A-3
• Carbon Monoxide Monitoring Locations	A-4
• Sulfur Dioxide Monitoring Locations	A-5
• Source and Ambient Lead Monitoring Locations	A-6
• PAMS Monitoring Locations	A-7
• PM2.5 Monitoring Locations	A-8
 Appendix B: Detailed Site Information	 B-1

INTRODUCTION

An annual review of the Air Quality Monitoring Network is required by Federal Regulations as a means to identify and report needs for additions, relocations, or terminations of monitoring sites or instrumentation. This report describes the network of ambient air quality monitors in the jurisdiction of and operated by the South Coast Air Quality Management District (South Coast AQMD). It includes a review of actions taken during the 2009-2010 fiscal year and plans for action in the year ahead. This draft plan addresses the requirements for an annual network plan as listed in Title 40, Part 58, Section 10 of the Code of Federal Regulations (40 CFR § 58.10). The regulations require that the report be submitted to the U.S. Environmental Protection Agency (EPA) by July 1 of each year.

The South Coast AQMD staff, along with the California Air Resources Board (CARB), conducted an extensive review of the air monitoring sites in the South Coast Air Basin (SCAB) in late 1980. National Air Monitoring Stations (NAMS) or State and Local Air Monitoring Stations (SLAMS) designations, monitoring objectives, and spatial scales of representativeness were assigned to the criteria pollutants monitored by site. Since that time, the EPA Region IX and CARB staff visited all sites to confirm compliance with applicable siting criteria and related requirements. The most recent site visits occurred in 2000 to evaluate the PM_{2.5} monitoring network. Each year, South Coast AQMD staff conducts an annual review of its air monitoring network and submits it to the EPA. The review process focuses on current and future network air monitoring strategies and all network changes are made in consultation with the EPA and CARB. When re-locations are required, site reports are updated in the EPA's Air Quality System (AQS) to document compliance with established siting criteria for the new locations.

Public Comments

Pursuant to Federal regulations, this draft plan was made available for public inspection and comments for at least 30 days prior to submission to the EPA. Hard copies of this document were made available on June 1, 2010 at the South Coast AQMD's Public Information Desk in Diamond Bar, CA. The document was also posted to the public South Coast AQMD website at www.aqmd.gov on June 1, 2010, with links under the South Coast AQMD home page titled "Current Programs, Events and Topics." Links to the document were also provided in the "Air Quality" area of the website. The Finalized document was submitted to the EPA on July 1, 2010 to fulfill Federal regulatory requirements.

Network Design

The South Coast AQMD operates 35 permanent, 2 port study, and 5 Pb air monitoring sites in SCAB and a portion of the Salton Sea Air Basin in Coachella Valley. This area includes Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino Counties. The newest permanent site was added during 2008 in Compton to replace the Lynwood air monitoring location and the newest Pb sites were added in 2010. Table 1 provides a list of monitoring locations, the EPA AQS site codes, and the pollutants measured at each site. Table 2 provides the monitoring objective and the spatial scale for each monitor at all sites.

Table 3 describes the monitoring purpose for the monitors at each site. Table 4 describes the monitoring objective, purpose, and spatial scale for continuous particulate analyzers at each site.

A new requirement of the annual network plan implemented in 2007, the monitoring purpose is the reason why a certain pollutant is being measured at a certain site. A list and description of monitoring purposes is provided below and portions are adapted from the CARB annual network plan for 2007.

Background Level monitoring is used to determine general background levels of air pollutants as they enter the SCAB.

High Concentration monitoring is conducted at sites to determine the highest concentration of an air pollutant in an area within the monitoring network. A monitoring network may have multiple high concentration sites (i.e., due to varying meteorology year to year).

Pollutant Transport is the movement of pollutant between air basins or areas within an air basin. Transport monitoring is used to assess and mitigate upwind areas when transported pollutant affects neighboring downwind areas. Also, transport monitoring is used to determine the extent of regional pollutant transport among populated areas and to rural areas.

Population Exposure monitoring is conducted to represent the air pollutant concentrations that a populated area is exposed to.

Representative Concentration monitoring is conducted to represent the air quality concentrations for a pollutant expected to be similar throughout a geographical area. These sites do not necessarily indicate the highest concentrations in the area for a particular pollutant.

Source Impact monitoring is used to determine the impact of significant sources or source categories of air quality emissions on ambient air quality. The air pollutant sources may be stationary or mobile.

Trend Analysis monitoring is useful for comparing and analyzing air pollution concentrations over time. Usually, trend analyses show the progress or lack of progress in improving air quality for an area over a period of many years.

Site Comparison monitoring is used to assess the effect on measured pollutant levels of moving a monitoring location a short distance (usually less than two miles). Some monitoring stations become no longer usable due to development, change of lease terms, or eviction. In these cases, attempts are made to conduct concurrent monitoring at the old and new site for a period of at least one year in order to compare pollutant concentrations.

Real Time Reporting/Modeling is used to provide data to EPA's AIRNOW system which reports conditions for air pollutants on a real time basis to the general public. Data is also used to provide accurate and timely air quality forecast guidance to residents of the SCAB.

Multiple purposes for measuring a pollutant at a particular site are possible. There is some overlap between monitoring objectives as defined by the EPA and given in Table 2. The monitoring purposes are provided in Table 3.

A brief description of the network for each criteria pollutant monitored is provided below:

OZONE

The South Coast AQMD operates 30 sites where ozone (O₃) measurements are made as part of the Air Monitoring Network. Figure 1 in Appendix A shows the spatial distribution of these sites.

PM10

Size-selective inlet high volume samplers are operated at 22 sites to meet the requirements for PM₁₀ Federal Reference Method (FRM) sampling. PM₁₀ continuous analyzers are operated at 13 sampling sites. These real-time devices are capable of making hourly particulate concentration measurements. Figure 2 in Appendix A shows the spatial distribution of the sampling sites. Real-time monitors, for the most part, are clustered in the high concentration areas, with two located in the desert area where wind-blown crustal material has caused exceedences of the twenty-four hour Standard. In downwind areas of the SCAB, a large fraction of particulate is formed in the atmosphere; PM₁₀ reaches maximum levels during late summer through early winter months. All PM₁₀ FRM monitors operate on a one day in six day schedule, with the exception of Indio and Rubidoux which operate on one day in three day schedule.

NITROGEN DIOXIDE

The nitrogen dioxide (NO₂) network consists of 26 sites. These sites are mostly located in areas of highest NO₂ concentration. The spatial distribution of NO₂ monitors is shown in Figure 3 in Appendix A. Review of 1992 through 2009 data indicates that the Federal annual average standard was not exceeded.

CARBON MONOXIDE

Ambient carbon monoxide (CO) monitors measure concentrations at 26 locations. Figure 4 in Appendix A, shows the spatial distribution of these sites. CO emissions, primarily from motor vehicles, show a pattern congruent with major freeway arteries.

SULFUR DIOXIDE

Sulfur dioxide (SO₂) monitors are located at 7 sites. Figure 5 in Appendix A shows the spatial distribution of the sites. Most SO₂ emissions come from federal transportation sources such as marine vessels. The monitors are clustered mostly in the areas where these sources are located. The federal standard has not been exceeded for nearly 30 years.

PARTICULATE LEAD

Total suspected particulate lead (Pb) measurements are collected at 15 sites as part of the network; 5 of the sites are Source Impact for Pb, and the remaining 10 sites measure ambient Pb and SO₄. The spatial distribution of these sites is shown in Figure 6 in Appendix A.

In 1990, the EPA requested that the South Coast AQMD collect ambient air particulate samples near several large Pb handling (battery recycling) facilities. Long-term source impacted monitoring began in 1991. A facility in the City of Industry exceeded the federal ambient particulate Pb standard during the second quarter of Fiscal Year 1991-92. Pb monitoring at a facility in the City of Torrance ended in 1993 when measurements were consistently below the ambient standard. Sampling ended at a facility in the City of Commerce in 2006 when the business was closed. Out of the two facilities currently being monitored, the facility in the City of Vernon exceeded the old federal ambient particulate Pb standard (1.5 ug/m³ quarterly) during the first quarter of 2008; the other facility was found to remain below this level. These source-related Pb sites are also depicted in Figure 6.

On November 12, 2008, the EPA issued final revisions to the NAAQS for Pb. New network design requirements include monitoring for sources of Pb (source oriented monitoring) and urban Pb monitoring (non-source oriented). To meet this requirement, a source oriented site was established on January 1, 2010 at the Van Nuys Airport and monitoring will continue at the sites surrounding the Exide (Vernon), Quemetco (Industry), and the Trojan Battery facilities. Existing urban Pb monitoring conducted at Compton, LAX Hastings, Long Beach (North), Los Angeles (Main), Pico Rivera, Riverside Magnolia, Rubidoux, San Bernardino, Long Beach (South), and Upland exceed the minimum monitoring requirements.

Photochemical Assessment Monitoring Stations (PAMS)

The PAMS network was initiated in June 1994 at Pico Rivera and Upland, and in 1995 at Banning and Azusa, to determine speciated hydrocarbon O₃ precursor compounds in ambient air. PAMS monitoring at Hawthorne commenced in June 1997 and the Burbank station became a PAMS site in July 1997. In May 2001, the Santa Clarita location was established as a PAMS site. In April 2004, the Hawthorne site was replaced by LAX Hastings, due to the end of a property lease. In August 2005, the Pico Rivera station moved to a new location one half mile south of the previous site, also due to the end of the property lease.

On October 17, 2006, the EPA issued final amendments to PAMS monitoring requirements in 40 CFR § 58. The changes made to the rule were to implement recommendations made by the PAMS workgroup formed to assess the program. The workgroup recommended changes be made to site type and monitoring objectives. During September 2008, a report from the EPA PAMS network assessment project workgroup was issued. The objectives of the workgroup were to assess how well the current PAMS network was meeting monitoring objectives, determine which sites are most useful for meeting objectives, identify potentially redundant, ineffective, or unnecessary sites, and to assess other enhanced O₃ monitoring activities that may prove useful.

To address regulatory changes, site-specific observations from the PAMS network assessment project, and potential synergies between programs, South Coast AQMD made the following changes in June 2009 to the PAMS monitoring network:

- Burbank was reclassified from Type 2/1 to Type 2. This change addressed the National PAMS Network Assessment observation that Burbank should be reclassified to a Type 2 precursor site. The recommendation is consistent with the heavily urbanized/industrialized area, which is impacted by high levels of O₃ precursor emissions.
- Santa Clarita was reclassified as Type 3 from Type 2. Although the National PAMS Network Assessment observed that Santa Clarita was consistent with a Type 2 site, recent data was more consistent with a Type 3 maximum O₃ concentration site rather than a Type 2 O₃ precursor site.
- Banning was relocated to Los Angeles (Main). The National PAMS Network Assessment observed that Banning had the lowest O₃ concentrations of all the Type 2 sites and should be reclassified to a Type 3 or 4 site. Instead, to create synergies between programs, South Coast AQMD relocated the Banning PAMS site to the Los Angeles (Main) site as Type 2. This satisfies the EPA recommendation for use of the same monitoring platform and equipment to meet the objectives of multiple programs. Los Angeles (Main) is also a National Air Toxics Trends Station (NATTS), a future National Core-Multi-pollutant Monitoring Station (NCore), and an Speciation Trends Network (STN) site.
- Azusa was reclassified from Type 3 to Type 2. This proposed change addresses the National PAMS Network Assessment observation that Azusa has high Volatile Organic Compounds (VOC) and Oxides of Nitrogen (NO_x) concentrations, with lower O₃ concentrations. The site now more closely resembles a Type 2 O₃ precursor site.
- Upland was relocated to the Rubidoux site. The National PAMS Network Assessment observed that Upland was no longer consistent with a Type 4 site and recommended reclassification to Type 3. South Coast AQMD relocated the Upland PAMS site to Rubidoux as a Type 3 location where synergies can be created among the National Air Toxics Trends Station (NATTS), National Core-Multi-pollutant Monitoring Station (NCore), and the STN programs.
- LAX Hastings and Pico Rivera remained unchanged.

Currently, manual VOC canisters are in operation at the Azusa, LAX Hastings, Rubidoux, Los Angeles (Main) and Santa Clarita air monitoring stations. During the intensive season from July 1 until September 30, VOC canisters are run every three hours for a period of twenty-four hours every 3rd day and a twenty-four hour sample is run every 6th day. During the non-intensive season from October 1 through June 30, twenty-four hour VOC canister samples are run every 6th day.

At Los Angeles (Main) and Santa Clarita air monitoring stations, during the intensive season from July 1 until September 30, carbonyl samples are run every three hours for a period of twenty-four hours every 3rd day and a twenty-four hour sample is run every 6th day. During the non-intensive season from October 1 through June 30, twenty-four hour carbonyl samples are run every 6th day.

Automated gas chromatography flame ionization detector (GC\FID) VOC systems are in operation at the Pico Rivera and Burbank air monitoring stations. During the intensive sampling season from July 1 until September 30, the GC\FID is run to collect 3-hour samples and twenty-four hour VOC canisters are run every 6th day. Like the other PAMS sites, carbonyl samples are run every three hours with one additional twenty-four hour sample run every 6th day. During the non-intensive season from October 1 through June 30, the GC/FID is idle and twenty-four hour VOC canister samples are run every 6th day and twenty-four hour carbonyl samples are run every 6th day. Rubidoux is a collocated site for VOC canister sampling and Pico Rivera is a collocated site for VOC canister and carbonyl sampling.

The first South Coast AQMD upper air meteorological monitoring station was established at Los Angeles International Airport (LAX) in 1994. Subsequent upper air stations include Ontario International Airport (ONT) installed in 1996, Moreno Valley (MOV) installed in 2001 at the Moreno Valley Municipal Water Treatment Plant in Riverside County, Irvine installed at the University of California Research and Extension Center in 2006, and Pacoima at Whiteman Airport during May 2007. The upper air stations use a combination of remote sensing and surface meteorological instrumentation, including the Vaisala (formerly Radian/URS) LAP-3000 radar wind profiler with a Radio Acoustic Sounding System (RASS), the Atmospheric Systems Corporation (formerly AeroVironment Inc.) mini Sodar acoustic wind profiler, and tower-mounted meteorological measurements of wind, pressure, temperature, relative humidity, solar radiation and ultraviolet radiation.

The PAMS network monitoring objectives and requirements are summarized in Table 6 and Figure 7 in Appendix A shows the distribution of the PAMS network.

PM2.5

A network of 17 Federal Reference Method (FRM) samplers was first implemented in January 1999. On December 26, 1999, a second Coachella Valley PM2.5 sampling site was established in Palm Springs. On June 20, 2003, PM2.5 sampling began at the South Long Beach site. The final addition to the PM2.5 FRM network occurred in October 2005, at the new Mira Loma site. This brings the total number of PM2.5 FRM sampling sites to 20. The sites are depicted in Figure 8, Appendix A and the starting date of each sampler is listed in Table 5. Collocated sampling sites include Rubidoux, Central Los Angeles, and Indio. All sites in the Network using FRM samplers are suitable for comparison against the annual PM2.5 National Ambient Air Quality Standard (NAAQS).

Continuous PM2.5 Met One Beta Attenuation Monitors (BAMs) were first deployed in fiscal year 2001–02. Sixteen monitors are now operating in the Basin, two at Rubidoux (collocated), and one each at Anaheim, Los Angeles, South Long Beach, Burbank, Mira Loma (Van Buren), and Banning. In January 2006, two additional samplers were added at Lake Elsinore and Glendora as part of the Children’s Health Study. As proposed in the 2008 network plan, FEM BAM monitors were deployed during October 2008, at the Anaheim, Burbank, Long Beach (North), Los Angeles (Main), Mira Loma (Van Buren), Rubidoux, and Long Beach (South) sites. Relocated NON-FEM BAM samplers were installed at Reseda, Riverside Magnolia, Santa Clarita, Crestline, and Upland was

collocated with a FEM BAM at Rubidoux. An additional BAM sampler was deployed at Temecula during July, 2010. All FEM BAMs continue to maintain the Special Purpose Monitor designation for two years under 40 CFR § 58.20 to assess comparability to FRM samples.

PM_{2.5} speciation sampling is also a part of the South Coast AQMD PM_{2.5} program. Two STN and one South Coast AQMD Met One SASS PM_{2.5} samplers were deployed in March 2001 at Rubidoux. One more STN and two South Coast AQMD SASS samplers were deployed at Central Los Angeles in 2002. In 2003, SASS PM_{2.5} speciation samplers were installed at Fontana and Anaheim air monitoring sites. In 2004, a sampler was installed at Long Beach as part of the MATES III project, and continued to operate as part of the Port Area Monitoring Program and the 2009 Air Quality Management Plan (AQMP) Speciation Study. In January 2009, two additional South Coast AQMD SASS speciation samplers were installed at Burbank and Upland air monitoring sites, also for the 2009 AQMP Speciation Study, which concluded on January 1st 2010. Analysis of the filters from the ambient network SASS samplers are being conducted at South Coast AQMD's laboratory. The STN filters are shipped to RTI for analysis. This approach has the concurrence of CARB and the EPA, Region IX.

During April 2009, South Coast AQMD completed minor changes to the FRM monitoring schedule to enhance FEM BAM comparisons. On April, 16th, 2009 the Burbank and Mira Loma (Van Buren) FRM samplers changed to daily sampling from the current 1-in-3 day schedule and the Azusa location changed from every day sampling to 1-in-3 day sampling. Federal minimum monitoring requirements for PM_{2.5} are still being met and/or exceeded.

National Ambient Toxics Trends Sites (NATTS)

The NATTS program was developed to fulfill the need for long-term hazardous air pollutant (HAP) monitoring data of consistent quality nationwide. South Coast AQMD has conducted several air toxics measurement campaigns in the past, which demonstrated the variety and spatial distribution of air toxics sources across SCAB. A single air toxics measurement site cannot reflect the levels and trends of air toxics throughout the Basin. For this reason, two NATTS sites are used to characterize the South Coast Basin's air toxics levels. The first site is a central urban core site in Los Angeles that reflects concentrations and trends due primarily to urban mobile source emissions. A second, more rural, inland site at Rubidoux captures the transport of pollutants from a variety of upwind mobile and industrial sources in the most populated areas of the air basin. NATTS monitoring began in February 2007 and continues at the Los Angeles (Main) and Rubidoux air monitoring sites. During April 2010, a system audit was conducted by the EPA, which assessed the South Coast AQMD NATTS program. The audit found no major issues with the operation of the network but recommended implementation of blanking and low level concentration challenge samples. Blanking will be implemented in 2010 and low level challenge samples will be implemented in 2011.

Special Programs

Special monitoring programs are conducted for rule compliance purposes or to characterize the levels of toxic air contaminants and other criteria pollutants in sub-regional areas or communities

in the Basin, or to support modeling and planning efforts. The following is a list of special monitoring programs that were active during the past year. Note that this is being provided for informational purposes only. At this time, Special Monitoring Programs are not designated as a “Special Purpose Monitor” under 40 CFR § 58.20.

Fugitive Dust Study

In support of South Coast AQMD Rule 403 - Fugitive Dust, SSI PM10 samplers are deployed on an episodic basis upwind and downwind of potential sources as required under Rule 403. Since 2003, periodic sampling has been conducted around gravel quarries and other industries which seem to be producing large volumes of dust. This sampling will continue through 2009 and 2010. A special instrument evaluation study was also initiated to assess alternative monitoring methodologies for Rule 403 compliance testing.

Hexavalent Chrome

The South Coast AQMD has an ongoing program of collecting ambient hexavalent chromium in the vicinity of several chrome plating and cement production facilities located throughout the basin. Monitoring continues at Newport Beach, Riverside, and other locations throughout the South Coast AQMD jurisdiction.

Port Area Monitoring Program

The South Coast AQMD conducted an intensive air-monitoring program in the communities adjacent to the Ports of Los Angeles and Long Beach. Monitoring consisted of all gaseous criteria pollutants, air toxics compounds as measured in MATES-III, as well as continuous PM_{2.5} and PM_{2.5} speciation. Sampling began at four sites in February 2007. Two more sites began operation in June 2007 and an additional site was added during November, 2007. Sampling was completed in January 2009, and data quality assessment and analysis is ongoing. Monitoring activities are being coordinated with the two Ports’ air monitoring programs as well as several CARB Research studies in the area.

2009 Air Quality Management Plan Speciation Study (AQMP)

Every three years, or as required by federal regulation, the South Coast AQMD prepares an Air Quality Management Plan (AQMP) outlining planned measures to bring the South Coast into attainment with federal and state ambient air quality standards. Once complete, the AQMP is submitted to CARB for inclusion in the state implementation plan (SIP). The next plan is scheduled for completion in late 2010 and will address the 24-hour PM_{2.5} NAAQS. In support of the 2010 AQMP analysis and modeling efforts, an enhanced speciation network was deployed for calendar year 2009. PM_{2.5} SASS samplers were installed at Burbank and Upland on January 1st, 2009 and the Long Beach (North) SASS sampler originally installed in 2004 as part of the MATES-III program and Port Area Monitoring Program continued to run in support of the AQMP. Sampling concluded on January 1st 2010.

Recent or Proposed Modifications to Network

Temecula AMS

During October 2007, Southern California experienced some of the most severe wildfires in recent history. To measure particulate matter for comparison to NAAQS, South Coast AQMD has used twenty-four hour FRM filter-based PM measurements. However, providing public information based on real-time hourly data is more appropriate for fire events. Currently South Coast AQMD does not have a location to represent the Temecula Valley. During FY 2010-11, South Coast AQMD plans the establishment of a location in the Temecula Valley to monitor PM_{2.5} on a continuous basis.

Crestline

South Coast AQMD has been operating the Crestline station since 1973. The deteriorating state of the shelter along with compromises made to the siting criteria due to obstructions has made it a candidate for replacement. As part of regular air monitoring station improvements a new station shelter as been ordered to replace the existing trailer.

Mira Loma

South Coast AQMD has been operating the Mira Loma (Jurupa) station as part of the Children's Health Study. The deteriorating state of the leased trailer along with the compromises made to the siting criteria because of school expansion makes it a candidate for relocation to a more representative site. Concurrent monitoring began at the Mira Loma (Van Buren) station in November 2005. Comparisons between the two sites found data trends to be comparable. Closure of the Mira Loma (Jurupa) is planned during FY 2010-11.

Long Beach (South)

South Coast AQMD has been operating the Long Beach (South) station as part of the ambient air-monitoring network. Recent construction of the buildings adjacent to our air monitoring equipment compromises the siting criteria. Monitoring began at the Long Beach (Anaheim St.) site as part of the Port Area Monitoring Project during 2007. If comparison of concurrent data between the two locations demonstrates some comparability, or if the Anaheim St. site shows consistently higher levels of PM, the Long Beach (South) site may be relocated to Anaheim St. in FY 2010-11.

NCore

NCore monitoring rules require that South Coast AQMD make NCore stations operational by January 1st, 2011. To meet this goal, South Coast AQMD has installed trace level analyzers for CO, NO_y and SO₂ at the Rubidoux and Central Los Angeles, which are both existing STN and NATTS sites.

Air Monitoring Station Improvements

As part of the actions to enhance quality of data collected, South Coast AQMD will replace existing deteriorated shelters at the Crestline, Indio, La Habra, Pasadena, Redlands, Rubidoux, San Bernardino, and West Los Angeles sites. The new shelters will be installed at the same locations as the existing structures.

Minimum Monitoring Requirements

The South Coast AQMD jurisdictional boundary encompasses two Metropolitan Statistical Areas (MSA) as defined by the U.S. Office of Management and Budget and the U.S. Census Bureau. The Los Angeles-Long Beach-Santa Ana MSA (Code 31100) had a population of 12,365,627 based on the year 2000 U.S. Census. The Riverside-San Bernardino-Ontario MSA (Code 40140) had a population of 3,254,821 in 2000. The minimum number of monitors for each pollutant is based on MSA population as described in 40 CFR § 58 Appendix D. The SCAQMD network exceeds the minimum monitoring requirements for all criteria pollutants. Details are provided below.

O₃

MSA	Min. # Monitors Required	# Monitors Active

TABLE 6. PAMS Proposed Network

Site Type	Date Established as PAMS	Site / AQS ID#	July 1 to September 30		October 1 to June 30		Additional Requirements
			VOC	Carbonyl	VOC	Carbonyl	
1	04/01/2004	LAX Hastings (replaced Hawthorne)	8 x 3 hr samples every 3 rd day and 1 x 24 hr sample every 6 th day	No Sampling	1 x 24 hr sample every 6 th day	No Sampling	
2	06/01/1995	Azusa	8 x 3 hr samples every 3 rd day and 1 x 24 hour sample every 6 th day	No Sampling	1 x 24 hr sample every 6 th day	No Sampling	No/NOx required
2	07/01/1997	Burbank	Continuous GC and 1 x 24 hr sample every 6 th day	8 x 3 hr samples every day and 1 x 24 hr sample every 6 th day	1 x 24 hr sample every 6 th day	1 x 24 hr sample every 6 th day	
2	06/01/2009	Los Angeles (Main)	8 x 3 hr samples every 3 rd day and 1 x 24 hour sample every 6 th day	8 x 3 hr samples every 3 rd day and 1 x 24 hr sample every 6 th day	1 x 24 hr sample every 6 th day	1 x 24 hr sample every 6 th day	Trace level CO required at one type 2 site.
2	08/01/2005	Pico Rivera #2	Continuous GC and 1 x 24 hr sample every 6 th day	8 x 3 hr samples every day and 1 x 24 hr sample every 6 th day	1 x 24 hr sample every 6 th day	1 x 24 hr sample every 6 th day	
3	06/09/2009	Rubidoux	8 x 3 hr samples every 3 rd day and 1 x 24 hour sample every 6 th day	No Sampling	1 x 24 hr sample every 6 th day	No Sampling	NOy required
3	05/01/2001	Santa Clarita	8 x 3 hr samples every 3 rd day and 1 x 24 hour sample every 6 th day	8 x 3 hr samples 3 rd day and 1 x 24 hr sample every 6 th day	1 x 24 hr sample every 6 th day	1 x 24 hr sample every 6 th day	

MONITORING OBJECTIVES:

- 1 – Upwind and background characterization site
- 2 – Maximum O3 precursor emissions impact site
- 3 – Maximum O3 concentration site
- 4 – Extreme downwind monitoring site

MONITORING REQUIREMENTS:

- One type 1 or type 3 site required per area
- One type 2 site required per area
- No type 4 required

REDUCED REQUIREMENTS:

- Speciated VOC only required at type 2 and one other (type 1 or 3)
- Carbonyl only required in areas classified as serious or above 8 hr zone
- NO/NOx required only at type 2
- NOy required at one site per PAMS area (type 1 or 3)

Start date		9/90		
Operation schedule	1:1	1:6 / 1:3		
Sampling season	1:1	All Year		
Probe height	All Year	2.9		
Distance from supporting structure	1.7	2.0		
Distance from obstructions on roof	N/A	N/A		
Distance from obstructions not on roof	N/A	N/A		
Distance from trees	N/A	N/A		
Distance to furnace or incinerator flue	N/A	N/A		
Distance between collocated monitors	N/A	N/A		
Unrestricted airflow	Yes	Yes		
Probe material	SS	SS		
Residence time	N/A	N/A		
Will there be changes within the next 18 months?	No			
Is it suitable for comparison against the annual PM2.5?	N/A	N/A		
Frequency of flow rate verification for manual PM samplers audit	N/A	N/A		
Frequency of flow rate verification for automated PM analyzers audit	Bi – weekly	N/A		
Frequency of one-point QC check (gaseous)	N/A	N/A

Detailed Site Information

Site Name	Van Nuys Airport			
AQS ID (AIRS #)	060371402			
GIS coordinates	Latitude: 34° 13' 10" Longitude: -118° 29' 21"			
Location	Commercial			
Address	16345 Raymer (Lot A) Van Nuys CA, 91406-1212			
County	Los Angeles			
Dist. to road	520m (Roscoe Blvd \ Woodley Ave.)			
Traffic count	30,882			
Groundcover	Dirt/Asphalt			
Representative Area	31100-Los Angeles-Long Beach-Santa Ana			
Pollutant	TSP			
Monitor obj	Source Impact			
Spatial scale	Microscale			
Sampling method	GMW TSP			
Serial #	1561			
Property #	53354			
Last Calibration Date	1/1/10			
Analysis method	Inductively Coupled Argon Plasma-Mass Spectrometry			
Start date	1/1/10			
Operation schedule	1:6			
Sampling season	All Year			
Probe height	2.6			
Distance from supporting structure	N/A			
Distance from obstructions on roof	N/A			
Distance from obstructions not on roof	N/A			
Distance from trees	N/A			
Distance to furnace or incinerator flue	N/A			
Distance between collocated monitors	N/A			
Unrestricted airflow	Yes			
Probe material	N/A			
Residence time	N/A			
Will there be changes within the next 18 months?	No			
Is it suitable for comparison against the annual PM2.5?	N/A			
Frequency of flow rate verification for manual PM samplers audit	N/A			

Air Quality Monitoring Network Plan – July 2010

Frequency of flow rate verification for automated PM analyzers audit	N/A			
Frequency of one-point QC check (gaseous)	N/A
