May 24, 2013

Mr. Todd Rinck
U.S. Environmental Protection Agency
Region 4
Atlanta Federal Building
61 Forsyth Street
Atlanta, GA 30303-8960

Dear Mr. Rinck:

This letter and accompanying Annual Network Plan reports on the status of the Ambient Air Monitoring commitments for the FY-10 105 Grant Work plan for Forsyth County, North Carolina (Reporting Organization 37-002). The entire Plan follows the Executive Summary, complete with staff field reviews as well as a copy of the published public notice.

I certify the ambient concentration data and the quality assurance data are completely submitted to AQS and the ambient data are accurate to the best of my knowledge taking into consideration the quality assurance findings. If you need additional information concerning these matters, please contact me at (336)-703-2451.

Sincerely,

Lawrence G. Akoje, Sr. Environmental Specialist
Monitoring and Mobile Sources Division

Enclosures

cc: Bob Ragland (FCEAP)
Donnie Redmond (NCDENR)
Joette Steger (NCDENR)
Ryan Brown (EPA-Region IV)
Executive Summary

Submit by May 1, 2013 an evaluation to demonstrate the requirements of 40 CFR Part 58.10 (a)(1) (Annual Network Evaluation) have been met.

This review was conducted in the winter of 2012 and will be discussed in more detail at the end of this letter.

Quality Assurance Procedures:

On September 26, 2007, the Forsyth County Office of Environmental Assistance and Protection submitted notification that the agency was currently following the NCDENR’s QMP. A revision to this submittal was due October 1, 2012 and this Office provided that revision. On February 5, 2013, this Office was notified that the submitted QMP was approved. This Office continues to follow and update, when necessary, all SOPs associated with our equipment.

Categorization of Ambient Monitors and Auxiliary Equipment.

The evaluation was completed in January 2012. The 1400 “A” series TEOM from the Peter’s Creek site was rated as Poor and has been removed from the Network. No other equipment was rated as Poor. The current emphasis remains maintenance of the monitoring buildings and consolidation of the network. Capital funds are available in limited quantity and are available if needed for replacement equipment.

Notify EPA within 30 days after exceedances/violations of NAAQS.

The Forsyth County Office of Environmental Assistance and Protection remained an active participant in the AirNow program. Part of that program ensures that all local and regional exceedances/violations of the NAAQS are submitted to EPA and all others affected in a timely fashion.

Comply with Exceptional Events Policy.

No situations requiring exceptional event flagging occurred since the last Annual Network Review period.

Submit list of urban areas for which AQI is reported.

Forsyth County reports the AQI for our part of the Greensboro-Winston-Salem-High Point MSA. AQI statistics are available in local newspapers, on the Department’s web site at http://www.forsyth.cc/EAP/, and through the NC-DAQ’s recorded 888-RU4NCAIR phone system. Real time data (updated hourly) are also available at: http://www.forsyth.cc/EAP/airmonitoringdata.aspx

Attend Region 4 QA Meeting & AIRS Conference.

Mr. Patrick Reagan and Mr. Lawrence Akoje attended the AQS Conference in August, 2012 in Providence, Rhode Island. Mr. Jason Bodenhamer and Mr. Lawrence Akoje attended EPA Region 4 QA meeting in Athens, GA during March, 2013.

Submit air quality forecasts for MSA’s >500,000 population to EPA AIRNOW.

Forsyth County has been a leader in this area and submits air quality forecasts for multiple pollutants to AIRNOW on a year-round basis. Several presentations on this program have been given at recent EPA National Forecasting and Outreach Conferences.
Changes in the SLAMS/NAMS Network

In August 2011, the PM10 sampler at the Peter’s Creek Station malfunctioned. This specific series of analyzer is no longer supported by the manufacturer making repairs of the unit difficult, at best. In November 2011, we concluded this instrument was not repairable. We have been in contact with EPA Region IV and we will seek permission to discontinue PM10 monitoring at this site, as duplicate data is still available at a separate location. This information has been provided to our EPA Region IV contact person. This analyzer has now been removed from the Network.

Data Submittal Criteria

All SLAMS/PARS data were submitted to AIRS within 90 days after each quarter.

National Performance Audit Program

No NPAP Audits were performed during 2012.

Continued-Annual Network Evaluation

Forsyth County has realigned the local monitoring network in recent years to account for changes in population, land use, and traffic patterns.

OZONE

The Shiloh Church site (37-067-0028) was established in 1996 to serve as the primary direction urban fringe monitor for Forsyth County. The maximum impact downwind site is operated by the State program in Rockingham County (Bethany School, 37-157-0099). The secondary wind direction is measured by the Union Cross site (37-067-1008). In addition, the Clemmons Middle site (37-067-0030), established in 2005, monitors the southwest sector of Forsyth County. An SPM ozone monitor at Hattie Avenue (37-067-0022) has operated since 1993 as part of North Carolina’s ozone precursor network. This monitor is now classified as a SLAMS monitor since it is now part of the Forsyth County network and maintained by staff from this Office. The reclassification was done during the 2012 data certification process with the help of Bill Frietsche of USEPA.

CARBON MONOXIDE

The microscale Peters Creek site (37-067-0023) has served as the maximum impact site for Forsyth County since 1988.

SULFUR DIOXIDE/NITROGEN OXIDES

Sulfur dioxide levels have been measured at the Hattie Avenue site (37-067-0022) since 1983. Readings are considered to be characteristic of background levels in Forsyth County. On occasion, the site is impacted by plume touchdowns from the Duke Energy Belews Creek Generating Station located approximately 20 miles to the north in Stokes County. In compliance with the most recent monitoring data requirements, 5-minute SO2 averaged data from this site is reported along with 1-hour data.

Nitrogen oxide levels have been measured at the Hattie Avenue site (37-067-0022) since 1984. Readings represent the neighborhood impact of major transportation related emissions from inter-city and intra-city traffic on Business I-40 and U.S. 52 bisecting Winston-Salem. Both monitors satisfy the most recent monitoring criteria related to the 1-hour SO2 and NO2 standards.

PARTICULATE

Continuous PM10 (TEOM) is no longer measured at the Peters Creek site (37-067-0023). Concentrations continue to be recorded at the Hattie Avenue site (37-067-0022). These readings are representative of a maximum impact particulate site influenced by background emissions and locally generated transportation emissions.
FRM STATUS
CORE PM2.5 sites have been established at Hattie Avenue (37-067-0022; 1/1 frequency) and Clemmons Middle (37-067-0030; 1/3 frequency + 1/6 collocated) as part of North Carolina’s EPA approved PM2.5 monitoring plan. Data collection has been quite successful and validated concentration and QA information has been reported to AQS through December 2012.

CONTINUOUS STATUS
A continuous PM2.5 (TEOM) was installed at the Hattie Avenue site in June 1999 and it was joined by an additional PM10 TEOM in October 1999. The data set continues to indicate excellent agreement between the FRM PM2.5 data and 24-hour averages obtained from the TEOM. An additional PM2.5 TEOM was established in the Clemmons area of Forsyth County. Installation occurred in the spring of 2005.

SPECIATION STATUS
A speciated PM2.5 monitor (1/6 frequency) began operation on September 22, 2001 and a carbon speciated PM2.5 monitor (1/6 frequency) began operation on February 28, 2007 at Hattie Avenue. Validated data sets have been received from RTI through December 2012.

AIR TOXICS
A (1/6) day air toxic sampler operated in conjunction with the NC-DAQ has been resident at the Hattie Avenue site since 2000. Program support has been erratic but there has been an improvement in the past year with a greater reliability of delivered canisters. Air toxic data remains under NCDAQ control. This Office does not review or upload this data to AQS.

LEAD
No lead monitors are currently in place at any sites within the County. Based on the interpretation of the lead monitoring requirements, recent population data, and recent source emission inventory data, there are no sources that emit more than 700 lbs of lead per year. Therefore, there are no immediate plans for lead monitoring in the County.

VISIBILITY PROGRAM
With financial assistance from Region 4 and the NC-DAQ, a visibility camera system was established for the Triad area during 2002. The associated web site combines pictures of two mountain scenes with hourly updated ozone and PM2.5 AQI statistics. A nephelometer was installed in 2004 to provide visual range data. The information is available at:
http://www.sehazecam.net.
2013 Annual Monitoring Network Plan

CERTIFICATION

By the signatures below, the Forsyth County Office of Environmental Assistance and Protection (FCEAP) certifies that the information contained in the 2013 Annual Monitoring Network Plan is complete and accurate at the time of submittal to EPA Region 4. However, due to circumstances that may arise during the sampling year, some network information may change. A notification of change and a request for approval will be submitted to EPA Region 4 at that time.

Sr. Environmental Specialist, Monitoring and Mobile Sources, FCEAP

Print Name: W. Minor Barnette Signature: Date: 5/28/13
Director, FCEAP
Introduction

The Forsyth County Office of Environmental Assistance and Protection’s (FCEAP) monitoring program provides air quality monitoring services in Forsyth County, NC. FCEAP is a state “certified local air pollution program” whose purpose(s) are to improve and maintain ambient air quality and reduce exposure to unhealthful air pollutants.

FCEAP has operated an air quality monitoring program since the early 1970’s. The air monitoring services provided by the program are conducted to measure concentrations of criteria air pollutants (CO, NO₂, SO₂, PM, lead, and O₃) in accordance with USEPA regulatory requirements. Measurements are used to assess compliance with National Ambient Air Quality Standards (NAAQS). The NAAQS define air pollutant concentration level thresholds judged necessary to protect the public health and welfare.

The FCEAP air monitoring program operates a network of state and local air monitoring stations (SLAMS) in Forsyth County. The current network configuration consists of seven monitoring stations that measure concentrations of criteria air pollutants. In addition to the SLAMS network the county network also includes monitoring for meteorological parameters and visibility conditions.

The annual monitoring network plan, as provided for in 40 CFR Part 58.10, Annual Monitoring Network Plan and Periodic Network Assessment must contain the following information for each monitoring station in the network:

1. The Air Quality System (AQS) site identification number for existing stations.
2. The location, including the street address and geographical coordinates, for each monitoring station.
3. The sampling and analysis method used for each measured parameter.
4. The operating schedule for each monitor.
5. Any proposal to remove or move a monitoring station within a period of eighteen months following the plan submittal.
6. The monitoring objective and spatial scale of representativeness for each monitor.
7. The identification of any sites that are suitable and sites that are not suitable for comparison against the annual PM₂.₅ NAAQS.
8. The Metropolitan Statistical Area (MSA), Core-Based Statistical Area (CBSA), Combined Statistical Area (CSA) or other area represented by the monitor.

The following information below replicates the Forsyth County Air Quality ambient air monitoring network plan and continues in the following sections outlined below:

II. Site Description Background Information and Definitions: An outline of the designations, parameters, monitoring methods, and the basis for site selection.

III. Network Summary: This section presents an overview of the total number of sites and monitors in Forsyth County. Also included is a listing of all proposed changes to the current network.

IV. Air Monitoring Station Description: Each air monitoring station is described in detail as per the outline in (II.) above. Modification to the network as determined by an annual review process will be made each year to maintain a current up-to-date network description document.
Site Description Background Information and Definitions

1. Site Description
   Specific information is provided to show the location of the monitoring equipment at the site, if the site is located in a CSA/MSA, the AQS identification number, the GPS coordinates, and evidence that monitors and monitor probes conform to the siting criteria.

2. Date Established
   The date when each existing monitoring station was established is shown in the description. For those stations, which are proposed, a date is provided when it is expected for the station to be in operation.

3. Site Approval Status
   Each monitoring station in the existing network has been reviewed with the purpose of determining whether it meets all design criteria for inclusion in the SLAMS network. Stations that do not meet the criteria will either be relocated in a nearby area or, when possible, re-sited at the present location.

4. Monitoring Objectives
   Per 40 CFR 58 Appendix D, Section 1.1:
   
   "The ambient air monitoring networks must be designed to meet three basic monitoring objectives. These basic objectives are listed below. The appearance of any one objective in the order of this list is not based upon a prioritized scheme. Each objective is important and must be considered individually."

   The objectives are summarized below:

   (a) Provide air pollution data to the general public in a timely manner.

   (b) Support compliance with ambient air quality standards and emissions strategy development. Data from FRM (Federal Reference Method), FEM (Federal Equivalent Method), and ARM (Approved Regional Method) monitors for NAAQS pollutants will be used for comparing an area’s air pollution levels against the NAAQS.

   (c) Support for air pollution research studies.

5. Monitoring Stations' Designations
   Most stations described in the air quality surveillance network are designated as State and Local Air Monitoring Stations (SLAMS). In addition, some of these stations fulfill other requirements, which must be identified. In this description of the network, designations are also made for National Air Monitoring Stations (NAMS), Special Purpose Monitors (SPM), and National Core (community oriented) stations (NCore). The following is the criteria used for each of these designations.
**SLAMS**

Requirements for air quality surveillance systems provide for the establishment of a network of monitoring stations designated as State and Local Air Monitoring Stations (SLAMS) that measure ambient air concentrations of those pollutants for which standards have been established. These stations must meet requirements that relate to four major areas: quality assurance, monitoring methodology, sampling interval and siting of instruments and instrument probes.

**NAMS**

Within the SLAMS network certain monitors are selected to provide the USEPA with timely data for use in national trends analysis. These NAMS monitors are identified in the summary of network stations.

**SPM**

Not all monitors and monitoring stations in the air quality surveillance network are included in the SLAMS network. In order to allow the capability of providing monitoring for various reasons such as: special studies, modeling verification and compliance status, and other objectives; certain monitors are designated as Special Purpose Monitors (SPM). These monitors are not committed to any one location or for any specified time period. They may be located as separate monitoring stations or be included at SLAMS locations. Monitoring data may be reported, provided that the monitors and stations conform to all requirements of the SLAMS network.

**NCORE**

National Core (community-oriented) multi-pollutant monitoring station data will be used to evaluate the regional air quality models used in developing emission strategies, and to track trends in air pollution abatement control measures’ impact on improving air quality.

6. **Monitoring Methods**

Sampling and analytical procedures for criteria air pollutant monitoring performed in the FCEAP ambient air monitoring network are conducted in accordance with applicable USEPA Designated Federal Reference (FRM) or Equivalent (FEM) Methods unless otherwise noted. Analytical techniques for non-criteria air pollutant monitoring (methods employed that are not USEPA Designated Federal Reference (FRM) or Equivalent (FEM) Methods) are documented in the applicable FCEAP Quality Assurance Project Plans (QAPP), FCEAP Standard Operating Procedures (SOP), or the appropriate North Carolina Division of Air Quality (NCDAQ) QAPP or SOP. Methods used by FCEAP for criteria pollutant monitoring are listed below:

**Particulate Matter 10 microns in size (PM_{10})**

All PM_{10} samplers operated by FCEAP are operated as federal reference method (FRM) or equivalent samplers and are operated according to the
requirements set forth in 40 CFR 50 and 40 CFR 53. Listed below is the USEPA Designated Reference or Equivalent Method used in the FCEAP monitoring network:

<table>
<thead>
<tr>
<th>Method Designation Number Method Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>R&amp;P TEOM Series 1400a EQPM-1090-079</td>
</tr>
</tbody>
</table>

**Particulate Matter 2.5 microns in size (PM\(_{2.5}\))**

With the exception of continuous samplers and speciation samplers all PM\(_{2.5}\) samplers operated by FCEAP are either FRM or FEM samplers. Listed below is the USEPA Designated Reference or Equivalent Method used in the FCEAP monitoring network:

<table>
<thead>
<tr>
<th>Method Designation Number Method Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>R &amp; P Partisol-Plus 2025 PM-2.5 Seq. RFPS-0498-118 118</td>
</tr>
</tbody>
</table>

**PM\(_{2.5}\) Speciation sampling and analysis**

In addition to operating PM\(_{2.5}\) samplers that determine only PM\(_{2.5}\) mass values, FCEAP also operates PM\(_{2.5}\) speciation samplers that collect samples that are analyzed to determine the chemical makeup of PM\(_{2.5}\). Data collected using this method cannot be compared to the NAAQS. Listed below is the method used in the FCEAP monitoring network:

<table>
<thead>
<tr>
<th>Method Designation Number Method Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>MetOne SASS NA NA</td>
</tr>
<tr>
<td>URG NA NA</td>
</tr>
</tbody>
</table>

**Sulfur Dioxide**

Instruments used to continuously monitor sulfur dioxide levels in the atmosphere employ the pulsed UV fluorescence method. Listed below is the USEPA Designated Reference or Equivalent Method used in the FCEAP monitoring network:

<table>
<thead>
<tr>
<th>Method Designation Number Method Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>Thermo Electron 43A, 43C-TLE, 43i EQSA-0486-060 100</td>
</tr>
</tbody>
</table>

**Carbon Monoxide**

Continuous monitoring for carbon monoxide is performed by use of the non-dispersive infrared (gas filter correlation) method. Listed below is the USEPA Designated Reference or Equivalent Method used in the FCEAP monitoring network:

<table>
<thead>
<tr>
<th>Method Designation Number Method Code</th>

</tbody>
</table>

**7. Quality Assurance Status**

FCEAP has an extensive quality assurance program to ensure that all air monitoring data collected meets established criteria for precision and accuracy. FCEAP operates according to EPA approved Quality Assurance Project Plans (QAPP) and Standard Operating Procedures. Staff members audit instrumentation on a scheduled basis to ensure that each instrument is calibrated and operating properly. Data validation is performed monthly to ensure data reported by each instrument is recorded accurately in the air quality monitoring database.

**8. Scale of Representativeness**

Each station in the monitoring network must be described in terms of the physical dimensions of the air parcel nearest the monitoring station throughout which actual pollutant concentrations are reasonably similar. Area dimensions or scales of representativeness used in the network description are:

(a) Microscale - defines the concentration in air volumes associated with area dimensions ranging from several meters up to about 100 meters.
(b) Middle scale - defines the concentration typical of areas up to several city blocks in size with dimensions ranging from about 100 meters to 0.5 kilometers.
(c) Neighborhood scale – defines concentrations within an extended area of a city that has relatively uniform land use with dimensions ranging from about 0.5 to 4.0 kilometers.

(d) Urban scale - defines an overall citywide condition with dimensions on the order of 4 to 50 kilometers.

(e) Regional Scale - defines air quality levels over areas having dimensions of 50 to hundreds of kilometers.

Closely associated with the area around the monitoring station where pollutant concentrations are reasonably similar are the basic monitoring exposures of the station. There are six basic exposures:

(a) Sites located to determine the highest concentrations expected to occur in the area covered by the network.

(b) Sites located to determine representative concentrations in areas of high population density.

(c) Sites located to determine the impact on ambient pollution levels of significant sources or source categories.

(d) Sites located to determine general background concentration levels.

(e) Sites located to determine the extent of regional pollutant transport among populated areas; and in support of secondary standards.

(f) Sites located to measure air pollution impacts on visibility, vegetation damage, or other welfare-based impacts.

The design intent in siting stations is to correctly match the area dimensions represented by the sample of monitored air with the area dimensions most appropriate for the monitoring objective of the station. The following relationship of the six basic objectives and the scales of representativeness are appropriate when siting monitoring stations:

<table>
<thead>
<tr>
<th>Site Type</th>
<th>Appropriate Siting Scales</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Highest concentration</td>
<td>Micro, middle, neighborhood (sometimes urban or regional for secondarily formed pollutants).</td>
</tr>
</tbody>
</table>

Table 1 - Siting Objectives and Scales

9. Data Processing and Reporting

All ambient air quality data are stored in the Environmental Data Acquisition System (EDAS) database located on the 5th floor of the Forsyth County Government Center, FCEAP, 201 N. Chestnut Street, Winston-Salem, North Carolina. On a daily basis the EDAS data are backed up and maintained at an off-site location. After all monthly data validation procedures are successfully completed, data is transmitted to the USEPA’s national Air Quality System (AQS) database. The AQS database is maintained by EPA as the official repository of the fully quality assured ambient air quality dataset.

(b) Site Description and Statement of Purpose

An ozone monitor, PM$_{2.5}$, TEOM, and PM$_{2.5}$ FRM have been located at a manufactured structure since April 27, 2005. A collocated PM$_{2.5}$ FRM sampler has been located less than 3m N of the reporting sampler since the same date. The site is located in a mixed use environment at latitude N36.026° and longitude W80.342°. The site elevation is 245 meters above sea level. The nearest road is Fraternity Church Road with a daily traffic volume of 4100 vehicles (2005) at a distance of 40 meters from the sample inlet. This site combined the PM$_{2.5}$ equipment from site 37-067-0024 and the ozone equipment from site 37-067-0027 when these sites were forced to relocate.

The inlet of the samplers is approximately 4 meters above ground level and 1 meter above roof level. The area is a transition zone of business (~50%) to residential (~50%) within a 1 km radius. The samplers are SLAMS.
The sampling frequency for PM$_{2.5}$ is 1 in 3 and 1 in 6 day sampling. The sampling interval is 24 hours, from midnight to midnight. The ozone instrument is operated during the North Carolina ozone monitoring season which begins April 1 and ends October 31. The ozone instrument operates continuously during this period.

The site complies with the siting requirements of 40CFR58 for criteria air pollutants. There are no proposed changes for this site. It is recommended that the current site status be maintained.

**OBJECTIVE AND SPATIAL SCALE**

The monitoring objectives of the instruments are to measure: 1) upwind background ambient concentrations and 2) population exposure.

The site is a neighborhood spatial scale for ozone and PM$_{2.5}$. Data from this site is used to assess compliance with the NAAQS for ozone and PM$_{2.5}$.

The site is located in the Winston-Salem, NC Metropolitan Statistical Area$^4$. The principal cities and counties in the MSA are Winston-Salem, Davie County, Forsyth County, Stokes County, and Yadkin County, NC.

(b) Description and Statement of Purpose

The Hattie Avenue site monitors ozone, sulfur dioxide, and oxides of nitrogen. The site is located in the 1300 block of Hattie Avenue in downtown Winston-Salem. The site is located approximately 2.2 km NE of downtown, 1.1 km E of US52 and approximately 1.8 km NNW of Interstate 40 Business in a residential district at latitude N36.110556° and longitude W80.226667°. The site elevation is 284 meters. The nearest road, Hattie Avenue, is 27 meters from the inlets and has a daily traffic flow of 3300 vehicles (2003). The nearest tallest building is St. Benedict’s Church (approximately 10 meters). The inlets are approximately 43 meters from the shopping center. The inlets are approximately 4 meters above the ground and 1 meter above the roof of the monitoring station. The area is residential. The ozone, sulfur dioxide, and NO\textsubscript{2} monitors are all SLAMS.

The ozone instrument is operated during the North Carolina ozone monitoring season which begins April 1 and ends October 31. The ozone instrument operates continuously during this period.

The SO\textsubscript{2} and NO\textsubscript{2} instruments operate continuously.
The site complies with the siting requirements of 40CFR58 for criteria air pollutants. There are no proposed changes for this site. It is recommended that the current site status be maintained.

OBJECTIVE AND SPATIAL SCALE

The monitoring objectives of the instruments are to measure: 1) background ambient concentrations and 2) population exposure.

The site is a neighborhood spatial scale. Data from this site is used to assess compliance with the NAAQS for ozone, sulfur dioxide, and nitrogen dioxide.

The site is located in the Winston-Salem, NC Metropolitan Statistical Area. The principal cities and counties in the MSA are Winston-Salem, Davie County, Forsyth County, Stokes County, and Yadkin County, NC.

Table 6 - Hattie Avenue "B" Monitoring Station Summary

(b) Description and Statement of Purpose

This Hattie Avenue site monitors PM$_{2.5}$ and PM$_{10}$. The site is located in the 1300 block of Hattie Avenue in Winston-Salem. The site is located approximately 2.2 km NE of downtown, 1.1 km E of US52 and approximately 1.8 km NNW of Interstate 40 Business in a residential district at latitude N36.110556° and longitude W80.226667°. The site elevation is 284 meters. The nearest road, Hattie Avenue, is 27 meters from the inlets and has a daily traffic flow of 3300 vehicles (2003). The nearest tallest building is St. Benedict’s Church (approximately 10 meters). The inlets are approximately 43 meters from the shopping center. The inlets are approximately 4 meters above the ground and 1 meter above the roof of the monitoring station. The area is residential. The monitors are SLAMS.

The PM$_{2.5}$ FRM sampling frequency is every day. The sampling interval is 24 hours, from midnight to midnight every day.

The PM$_{2.5}$ Speciation sampling frequency is 1 in 6 days. The sampling interval is 24 hours, from midnight to midnight every six days.
The PM$_{2.5}$ and PM$_{10}$ TEOM instruments operate continuously.

Monitoring for Urban Air Toxics (UAT) is currently conducted at this site by the North Carolina Division of Air Quality (NC-DAQ), Toxics Protection Branch (TPB). Currently, the NC-DAQ TPB collects whole air samples in stainless steel 6 liter- pressurized canisters. The samples are then analyzed using cryogenic preconcentration gas chromatography with mass spectrometric detection (GC/MS) via the Compendium Method for Toxic Organics (TO) 15 for the list of 68 compounds (below).
• Propene
• Freon 12
• Freon 22
• Freon 114

(b) Site Description and Statement of Purpose

A CO sampler has been located at the Peter’s Creek station on November 14, 1998. A PM\textsubscript{10} sampler was located at 310 1401 Corporation Parkway. In November 2011, the instrument failed. The vendor of this unit no longer supported the series and staff determined the unit was not repairable. The PM\textsubscript{10} sampler was discontinued at that time. The site is located approximately 4 kilometers SW of the central business district at latitude N36.065833° and longitude W80.258333°. The site elevation above sea level is 233 meters. The nearest road is Peter’s Creek Parkway at a distance of approximately 6 meters. The estimated daily traffic flow is 24,000 vehicles (2005). The inlet is approximately 4 meters above the ground and 1 meter from the roof. The area is commercial with several residential areas near the sampler. The CO sampler is SLAMS.

The sampling frequency for CO is continuous.

The site complies with the siting requirements of 40CFR58 for criteria air pollutants. There are no proposed changes for this site. It is recommended that the current site status be maintained.
OBJECTIVE AND SPATIAL SCALE

The monitoring objective of the Peter's Creek site is population exposure. The site is a micro spatial scale. Data is used to assess trends and compliance to the NAAQS.

The site is located in the Winston-Salem, NC Metropolitan Statistical Area. The principal cities and counties in the MSA are Winston-Salem, Davie County, Forsyth County, Stokes County, and Yadkin County, NC.

(b) Site Description and Statement of Purpose

An ozone monitor has been located at this site since April 1, 1996. The site is located approximately 12 km NNE of the central business district at latitude N36.203056° and longitude W80.215833°. The site elevation is 294 meters above sea level. The nearest road is Baux Mountain Road with a daily traffic volume of 2000 vehicles (2003) at a distance of 20 meters from the sample inlet.

The inlet is approximately 4 meters above the ground and 1 meter from the roof. The area is residential. The ozone sampler is SLAMS.

The ozone instrument is operated during the North Carolina ozone monitoring season which begins April 1 and ends October 31. The ozone instrument operates continuously during this period.

The site complies with the siting requirements of 40CFR58 for criteria air pollutants. There are no proposed changes for this site. It is recommended that the current site status be maintained.

OBJECTIVE AND SPATIAL SCALE

The monitoring objective of the instrument is to measure population exposure.

The site is a neighborhood spatial scale for ozone. Data from this site is used to assess compliance with the NAAQS for ozone.

The site is located in the Winston-Salem, NC Metropolitan Statistical Area. The principal cities and counties in the MSA are Winston-Salem, Davie County, Forsyth County, Stokes County, and Yadkin County, NC.

(b) Site Description and Statement of Purpose

An ozone monitor has been located at this site since April 1, 1998 along with a meteorological tower since 1997. The site is located approximately 10 km SE of the central business district at latitude N36.050833° and longitude W80.143889°. The site elevation is 285 meters above sea level. The nearest road is Piedmont Memorial Drive with an annual traffic volume of 820 vehicles (2005) at a distance of 55 meters from the sample inlet.

The inlet is approximately 4 meters above the ground and 1 meter from the roof. The area is residential. The ozone sampler is SLAMS.

The ozone instrument is operated during the North Carolina ozone monitoring season which begins April 1 and ends October 31. The ozone instrument operates continuously during this period.

The site complies with the siting requirements of 40CFR58 for criteria air pollutants. There are no proposed changes for this site. It is recommended that the current site status be maintained.
