<sup>3</sup>*Institute of Environmental Physics and Institute of Remote Sensing, University of Bremen, Germany*

<sup>4</sup>*Global Systems Division, NOAA Earth System Research Laboratory, Boulder*

## Motivation

- Electric power generation accounted for about 25% of US NO<sub>x</sub> emissions in late 1990's
- Since then, NO<sub>x</sub> pollution controls were implemented by utility companies
- Satellite measurements of NO<sub>2</sub> vertical columns have been available since 1995
  - Do satellite observations reflect these emission changes?

# Outline

- CEMS observations of emission control efforts
- Satellite measurement methods
- Model description
- Power plant updates to NEI 1999 using CEMS data
- Results
  - Satellite and model spatial distribution of NO<sub>2</sub> columns
  - Year-to-year trends in NO<sub>2</sub> columns and emissions
  - Seasonal trends in satellite and model NO<sub>2</sub> columns
  - Model predictions of boundary layer NO<sub>2</sub> and O<sub>3</sub> changes

# Point Source NO<sub>x</sub> Emission Control Programs

- Acid Rain Program
  - 1990 - present
  - part of Title IV of 1990 Clean Air Act Amendments
  - limits annual NO<sub>x</sub> emission rate (lb/mmBTU)
  - all US coal-fired power plants

- Ozone Transport Commission NO<sub>x</sub> Budget Program
  - 1999 - 2002 ozone seasons (May - Sept)
  - cap-and-trade
  - all point sources in OTC region

OTC Zones for NO<sub>x</sub> Control

- EPA 1998 NO<sub>x</sub> State Implementation Plan (SIP) Call
  - states must amend SIPs to decrease downwind O<sub>3</sub>
  - caps ozone season E(NO<sub>x</sub>) for each state
  - states decide on strategy and sources to control
- NO<sub>x</sub> Budget Trading Program
  - 2003 - present ozone seasons
  - cap-and-trade
  - extends OTC program to entire SIP Call region
  - all large point sources in NO<sub>x</sub> SIP Call region

NO<sub>x</sub> SIP Call Region

# CEMS Data Analysis

## CEMS = Continuous Emission Monitoring Systems

- Direct observations of point source emissions
- Hourly NO<sub>x</sub>, SO<sub>2</sub>, and CO<sub>2</sub> emissions and heat input
- Reported quarterly to EPA Clean Air Markets Division
- Data for 966 facilities in 1999 and 1427 facilities in 2004
- Most sources: electric power generation, co-generation with other industry

## Clean Air Markets Query Wizard

- Very useful web tool to extract and aggregate CEMS data
- User specifies:
  - Unit or monitoring level
  - Time aggregation period
  - Year
  - Emissions aggregation level
  - Output fields
  - View or download reports

<http://cfpub.epa.gov/gdm/index.cfm?fuseaction=emissions.wizard>

**U.S. Environmental Protection Agency**

### Clean Air Markets - Data and Maps

[Recent Additions](#) | [Contact Us](#) | [Print Version](#) | [Customer Satisfaction](#) Search:

[EPA Home](#) > [Clean Air Markets](#) > [Data and Maps](#) > [Emissions](#)

#### Emissions

[CAMD Home](#) [D&M Home](#) [Help](#) [Data Definitions](#)

Welcome to the Emissions menu. These tools provide data for both simple reports and sophisticated custom queries. For quick and easy access to data, use **Quick Reports** to select from a variety of standard reports. To create a custom report using specific criteria, use either the **Unit Level** or the **Monitoring Location Level** query wizard. These tools are available on the left hand menu.

It's easy to construct a **Unit Level** or **Monitoring Location Level Emissions** query by following these steps:

1. Click on the **Unit Level** or the **Monitoring Location Level** folder to select your emissions measurement location.
2. Pick from the criteria categories to add criteria to your query.
3. Select the level on which the data are summarized on the **Select Aggregate** tab.
4. Select the report template on the **Select Output** tab.
5. View, print, or download your report on the **View Results** tab.

Place your mouse over the menu items to see their instructions.

[Home](#) [Help](#)

Aggregation Level: Unit  
Your query will return data for 1237 facilities and 3776 units.

You specified: Year(s): 2002

**Select a Program**

Programs:  For the Acid Rain Program (ARP), data are available for the years 1980, 1985, 1990, and 1995 to present.

Select one program from the list and then click "Add Program" to include it in your query. To change the program, make a new selection and click "Update Program."

# Annual NO<sub>x</sub> CEMS Trends

- US since late 1990's
  - NO<sub>x</sub> emissions decreased
  - Heat input increased slightly
- Ohio River region (IL, IN, KY, OH, PA, WV)
  - One-third of US power plant NO<sub>x</sub> emissions in late 1990's
  - High density of coal-burning plants
  - High NO<sub>x</sub> emissions per unit of electricity generated
  - NO<sub>x</sub> emissions decreased even faster than US as a whole
  - Heat input almost constant

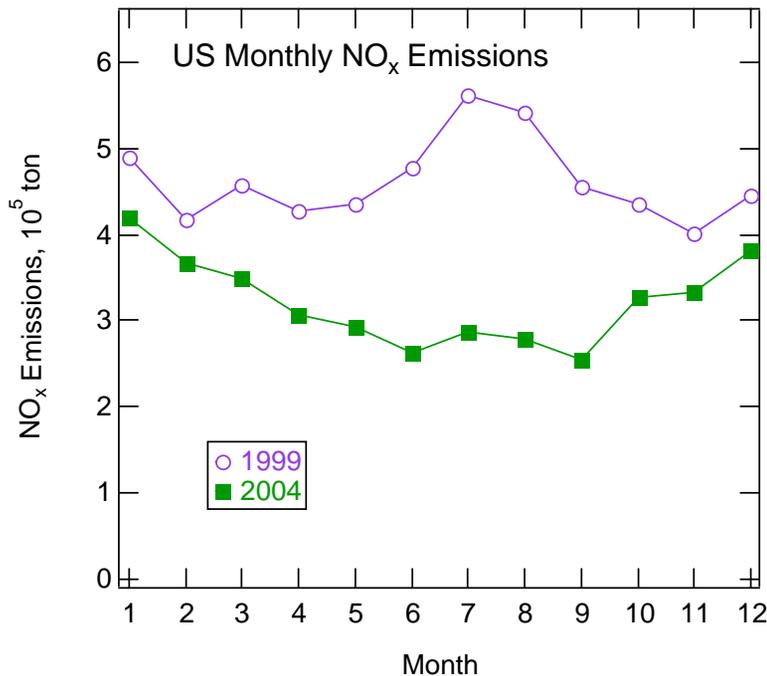

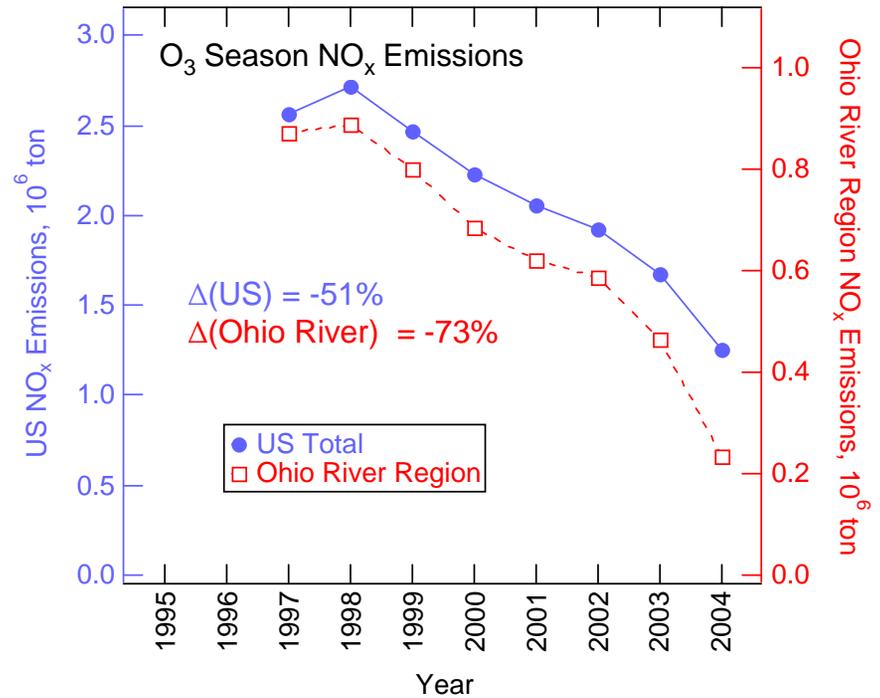

➤ Substantial NO<sub>x</sub> emission reductions while maintaining amount of electric power generated

# Seasonal NO<sub>x</sub> CEMS Trends

## O<sub>3</sub> season NO<sub>x</sub> emissions

- May - September total
- Summer use of controls
- Larger decreases than annual
- Ohio River region got even greater benefit than nation as a whole

## Monthly power plant NO<sub>x</sub> emissions

- Before controls: maximum in summer
- After controls: minimum in summer

➤ Changes in seasonal behavior of power plant NO<sub>x</sub> emissions

# Satellite Instruments

## SCIAMACHY

**SC**anning **I**maging **A**bsorption spectro**M**eter  
for **A**tmospheric **CH**artograph**Y**

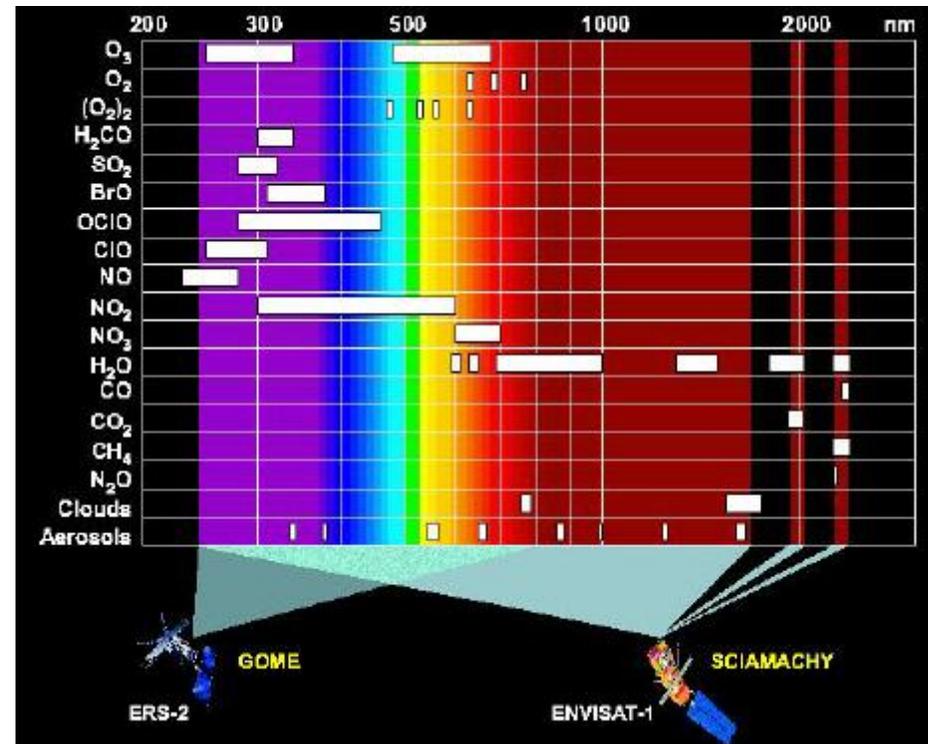

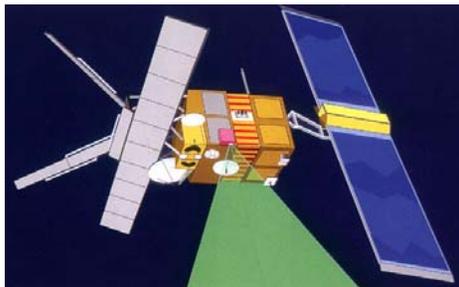

- launched in March 2002 on ENVISAT
- horizontal resolution:  $60 \times 30 \text{ km}^2$

## GOME

**Global O**zone **M**onitoring **E**xperiment

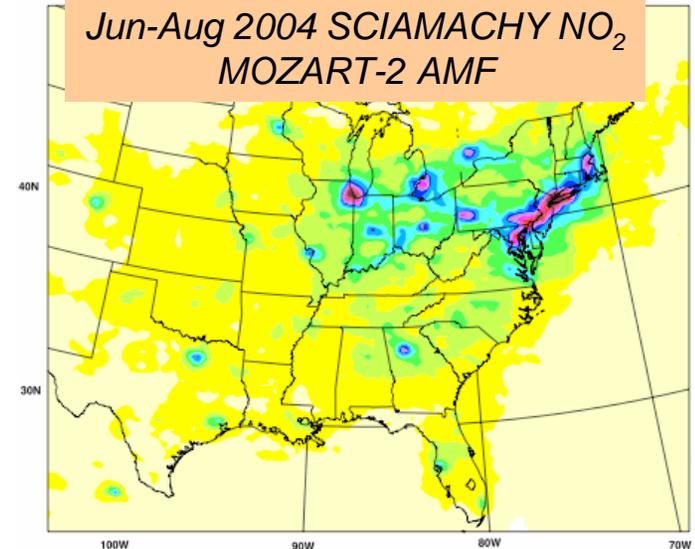

- launched in April 1995 on ESA ERS-2
- operated from August 1995 to June 2003
- horizontal resolution:  $320 \times 40 \text{ km}^2$

# Extracting NO<sub>2</sub> Vertical Columns from Satellite Measurements

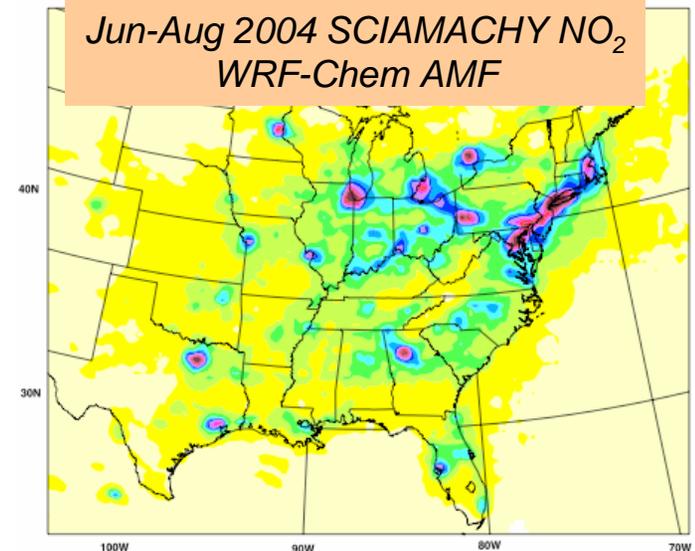

- Measure NO<sub>2</sub> absorption
  - Differential Optical Absorption method (425-450 nm)
- Remove stratospheric component
  - subtract clean reference sector data from same day
- Cloud filtering
  - remove data with cloud fraction > 0.15
- Convert tropospheric residual to vertical column
  - account for vertical sensitivity
    - ⇒ radiative transfer model SCIATRAN
  - Air Mass Factor (AMF): *a priori* information on surface spectral reflectance, surface altitude, aerosol loading and shape of NO<sub>2</sub> vertical distribution
    - ⇒ chemical transport model
    - Previously: MOZART-2 (2° × 2°)
    - This study: WRF-Chem (27 × 27 km<sup>2</sup>)

Jun-Aug 2004 SCIAMACHY NO<sub>2</sub>  
MOZART-2 AMF

Max= 20.89 (10<sup>15</sup> molec. cm<sup>-2</sup>)

Jun-Aug 2004 SCIAMACHY NO<sub>2</sub>  
WRF-Chem AMF

Max= 22.32 (10<sup>15</sup> molec. cm<sup>-2</sup>)

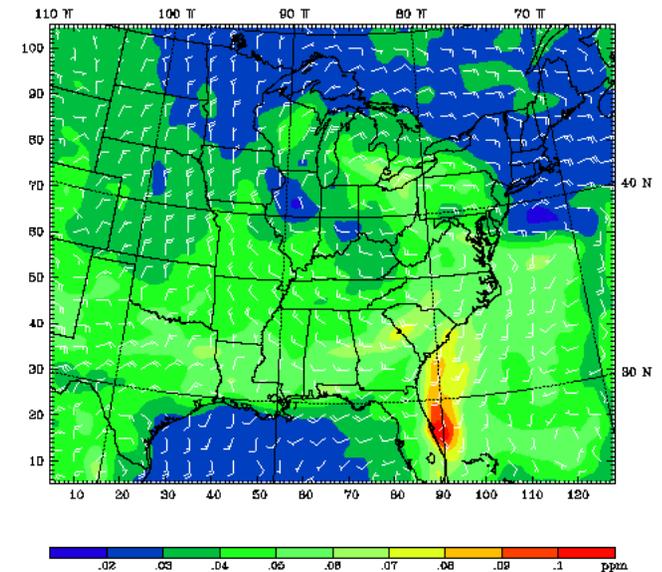

# Air Quality Model Description

## WRF-Chem

### Weather Research & Forecasting Model with On-line Chemistry

- WRF version 2
- RADM II chemical mechanism
- MADE/SORGAM aerosol mechanism
- BEIS3.11 biogenic emissions
- YSU PBL scheme
- NOAH land-surface model
- Grell-Devenyi ensemble cumulus scheme
- WSM6 microphysics scheme
- Horizontal domain: 60.9°W-112.1°W, 23.2°N-51.5°N
- Vertical domain: 0 to ~18 km
- Horizontal resolution: 27 km
- Vertical resolution: 0.017 (surface) to 2.4 km (20 hPa)
- Retrospective 24-hour forecasts starting at 00Z every day from 1 April 2004 to 31 October 2004
- More WRF-Chem details:
  - ❖ <http://ruc.fsl.noaa.gov/wrf/WG11/>
  - ❖ G. Grell et al., *Atmospheric Environment*, 2005

Ozone Concentration at 40 m      Init: 0000 UTC Sun 14 May 06  
Fest: 21.00      Valid: 2100 UTC Sun 14 May 06 (1600 MDT Sun 14 May 06)

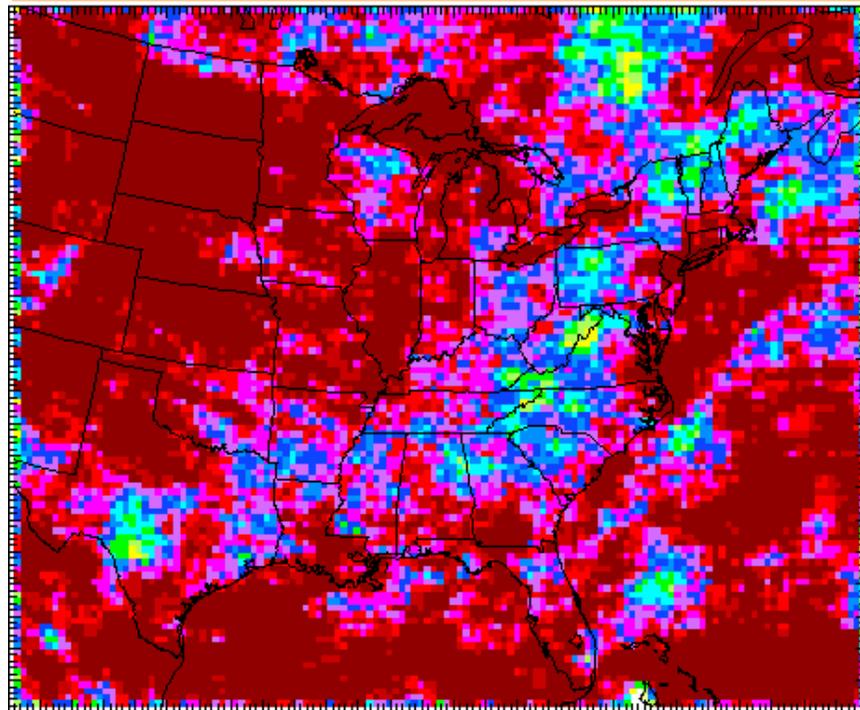

Real time air quality forecasts:  
<http://www-frd.fsl.noaa.gov/aq/wrf/>

# Data Sampling and Averaging

- SCIAMACHY data projected on to WRF-Chem grid
- Model sampled at ~10:30 LT during satellite overpass
- Cloudy grid cells filtered from both satellite and model data
- Same number of satellite and model data samples in each grid cell

*Jun-Aug 2004 Number of Samples per Grid Cell*

Number  
0.00 1.00 2.00 3.00 4.00 5.00 6.00 7.00 8.00 9.00 10.00 11.00 24.00

# Reference Emission Inventory

## Continuous Emission Monitoring System (CEMS)

- <http://www.epa.gov/airmarkets/emissions>
- compiled by electric power industry
- hourly measurements
- NO<sub>x</sub>, SO<sub>2</sub>, CO<sub>2</sub>, heat input

## National Emissions Inventory (NEI)

- <http://www.epa.gov/ttn/chief/emch/index.html>
- compiled every 3 years by EPA
- **latest final dataset: 1999 version 3 (available March 2004!)**
- county level
- annual and O<sub>3</sub> season day
- NO<sub>x</sub>, CO, SO<sub>2</sub>, VOCs, NH<sub>3</sub>, PM<sub>2.5/10</sub>

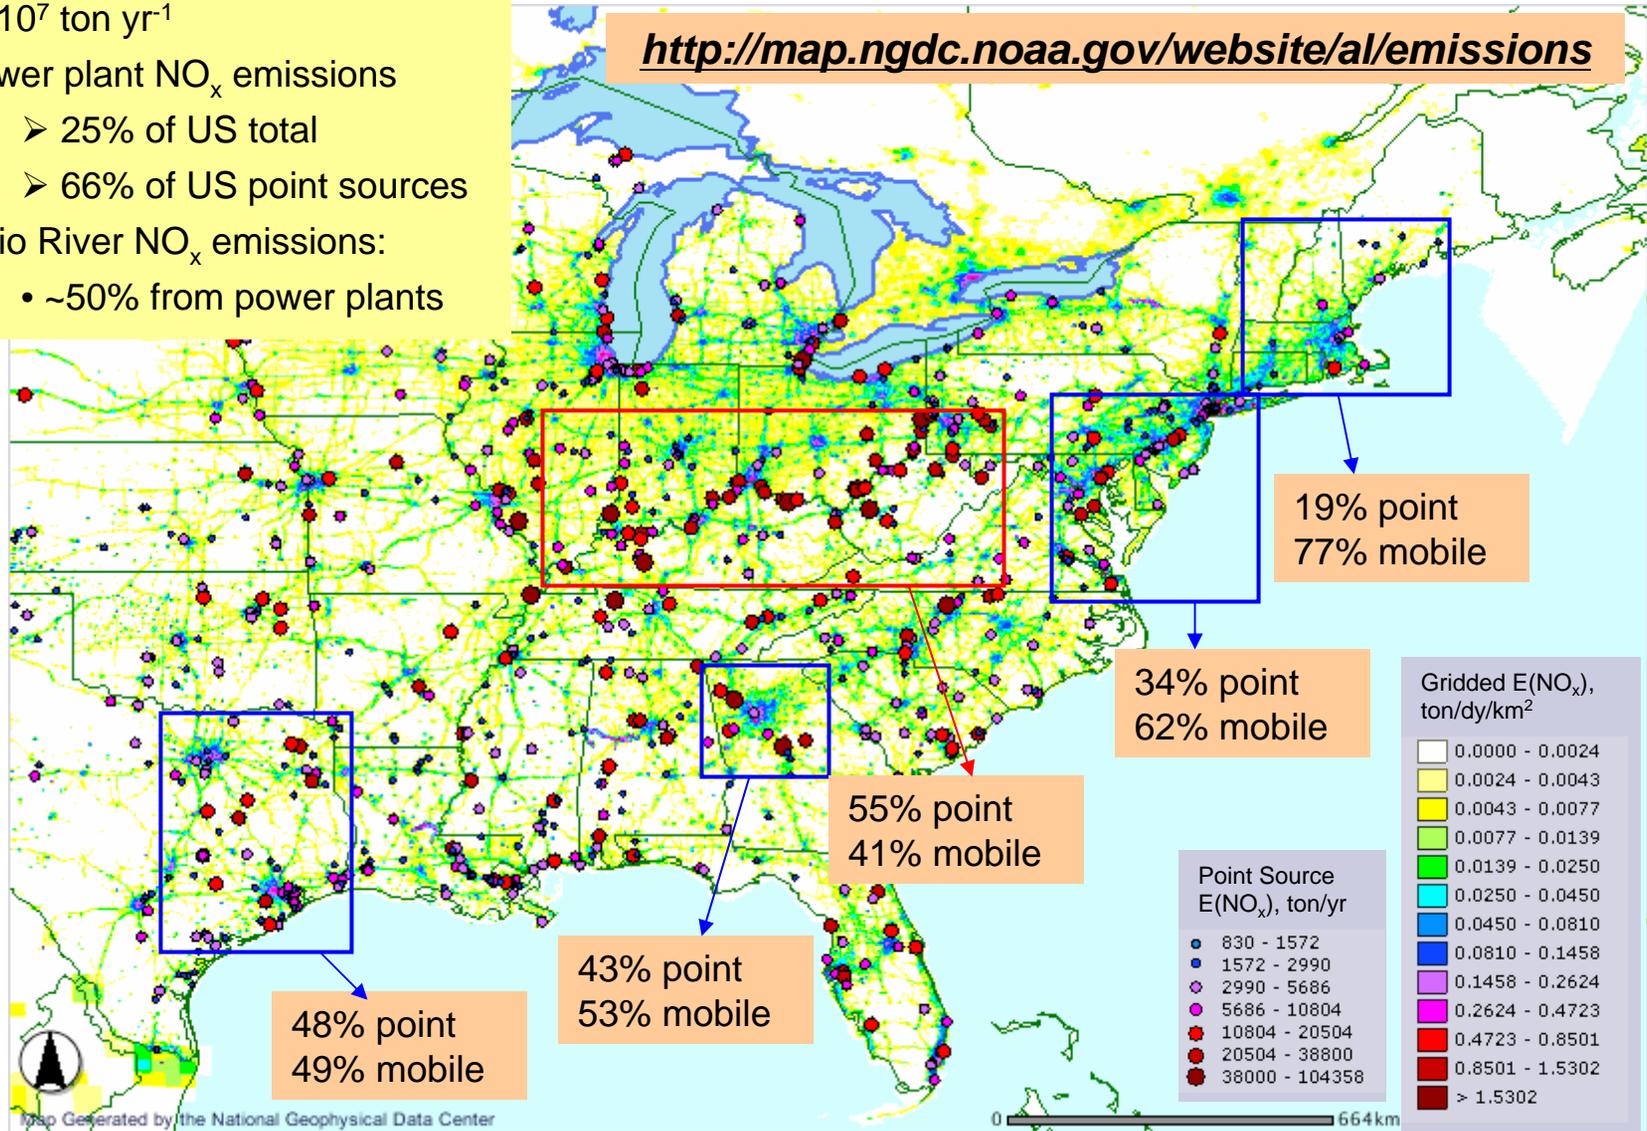

## 1999 NOAA/AL Model EI

- <http://ruc.fsl.noaa.gov/wrf/WG11/anthropogenic.htm>
- 4 km grid
- O<sub>3</sub> season day
- RADM2, RACM, SAPRC-99, CB-IV, CBM-Z
- Emissions mapviewer:  
<http://map.ngdc.noaa.gov/website/al/emissions>

# NEI 1999 NO<sub>x</sub> Emissions

- NEI 1999 US NO<sub>x</sub> emissions =  $2.4 \times 10^7$  ton yr<sup>-1</sup>
- Power plant NO<sub>x</sub> emissions
  - 25% of US total
  - 66% of US point sources
- Ohio River NO<sub>x</sub> emissions:
  - ~50% from power plants

<http://map.ngdc.noaa.gov/website/al/emissions>

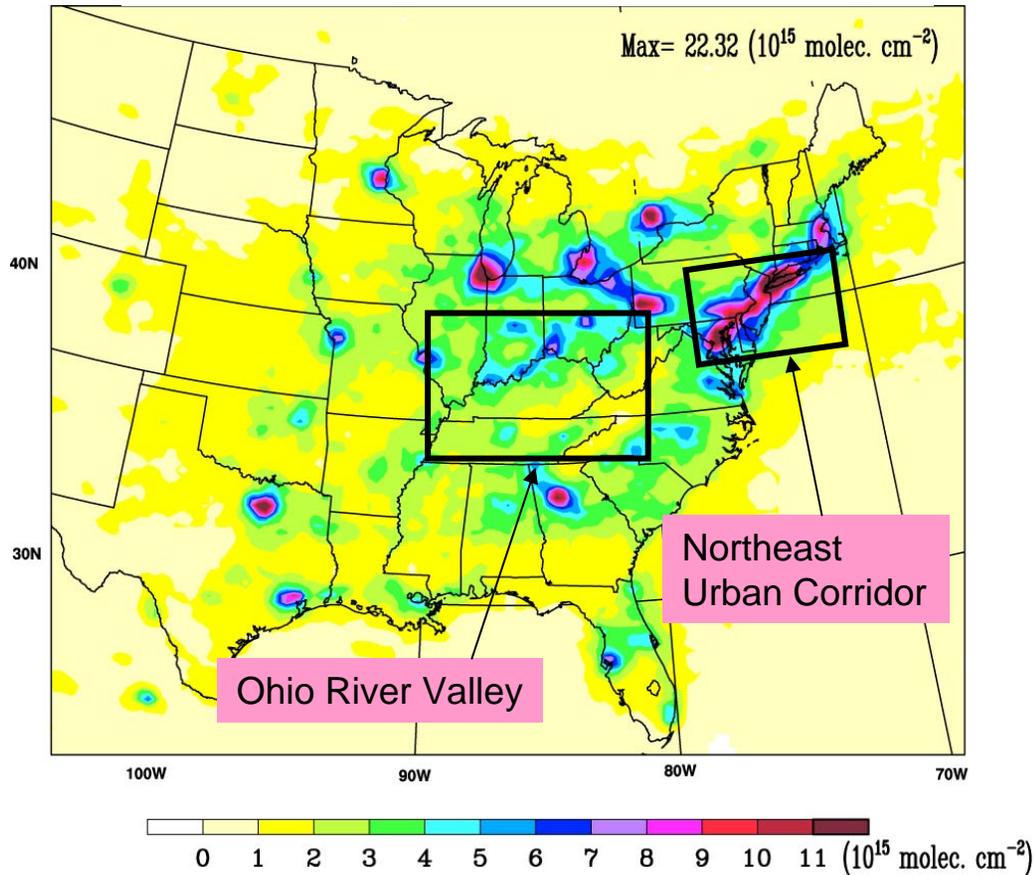

## Updated Emission Inventory

- Processor updates NEI 1999 point source emissions with CEMS data reports generated by Clean Air Markets Query Wizard
- CEMS monthly NO<sub>x</sub> and SO<sub>2</sub> emissions for April - October 2004
- Updated about 1000 facilities in NEI 1999
- NEI 1999 point source must have ORISPL code
  - 66% of NO<sub>x</sub> and 82% of SO<sub>2</sub> total NEI 1999 point source emissions
  - updated 97% of NO<sub>x</sub> and SO<sub>2</sub> emissions from these sources
  - assigned 95% of NO<sub>x</sub> and 99% of SO<sub>2</sub> emissions in 2004 monthly CEMS datasets to these sources
- Emissions from facilities in NEI 1999 but not in CEMS dataset
  - keep at 1999 levels
- Emissions from facilities in CEMS dataset but not in NEI 1999
  - not included
- NEI 1999 area and mobile emissions
  - not modified

# Spatial Distribution of NO<sub>2</sub> Columns

SCIAMACHY

Summer 2004 (June-August) Averages

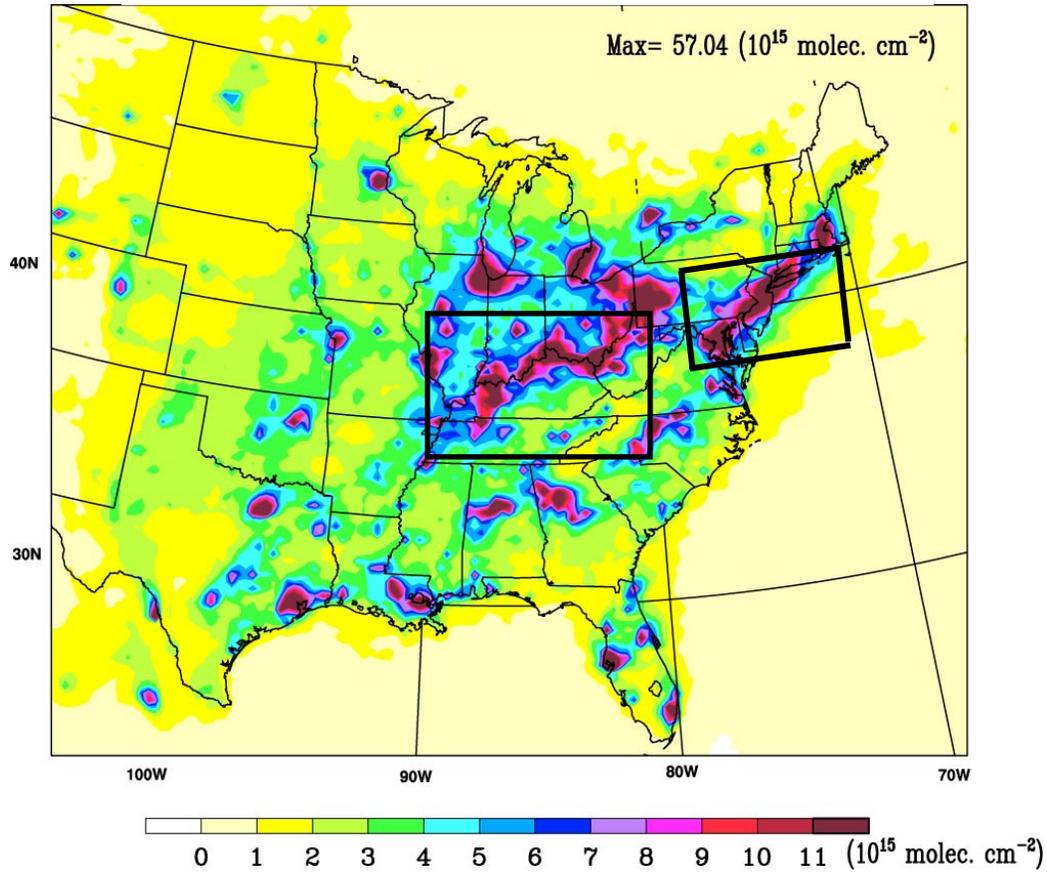

# Spatial Distribution of NO<sub>2</sub> Columns

WRF-Chem with Reference Emissions

➤ NEI 1999

Summer 2004 (June-August) Averages

Model vs satellite linear fit

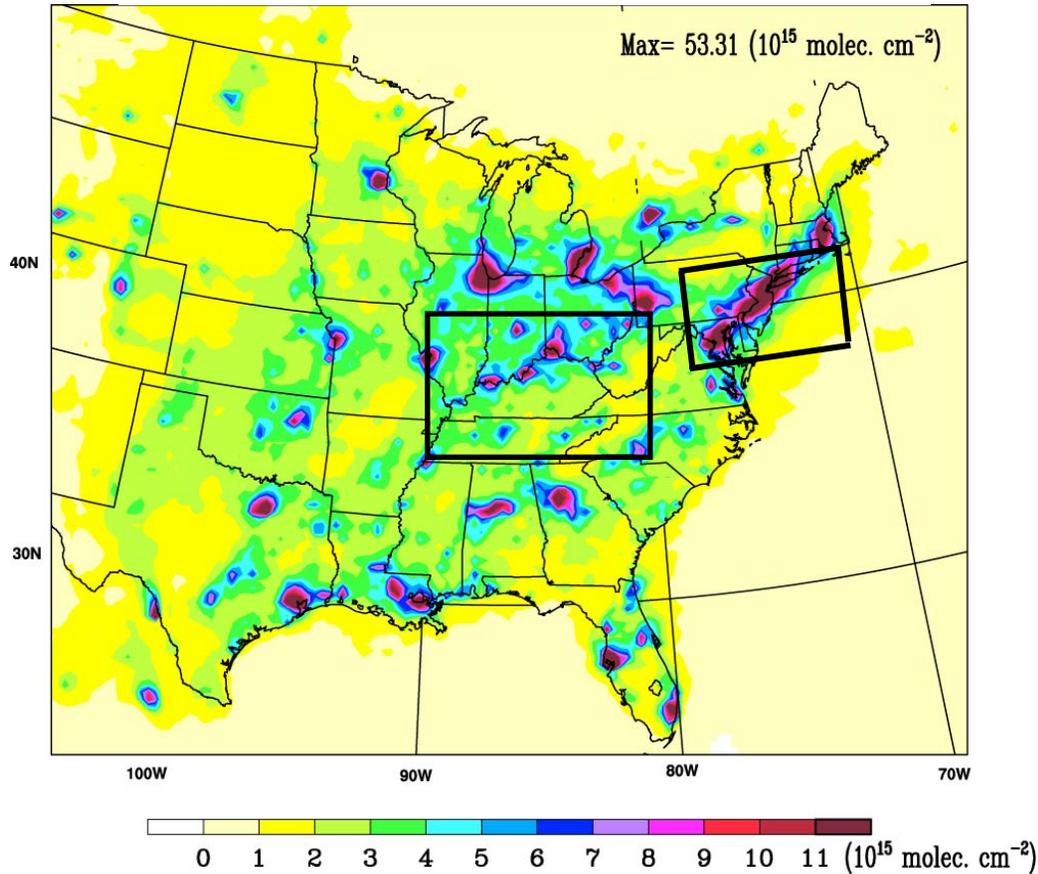

▪ slope = 1.48, r = 0.84

# Spatial Distribution of NO<sub>2</sub> Columns

## WRF-Chem with Updated Emissions

- ~1000 power plants updated with 2004 monthly CEMS data
- All other sources same as NEI 1999

Summer 2004 (June-August) Averages

Model vs satellite linear fit

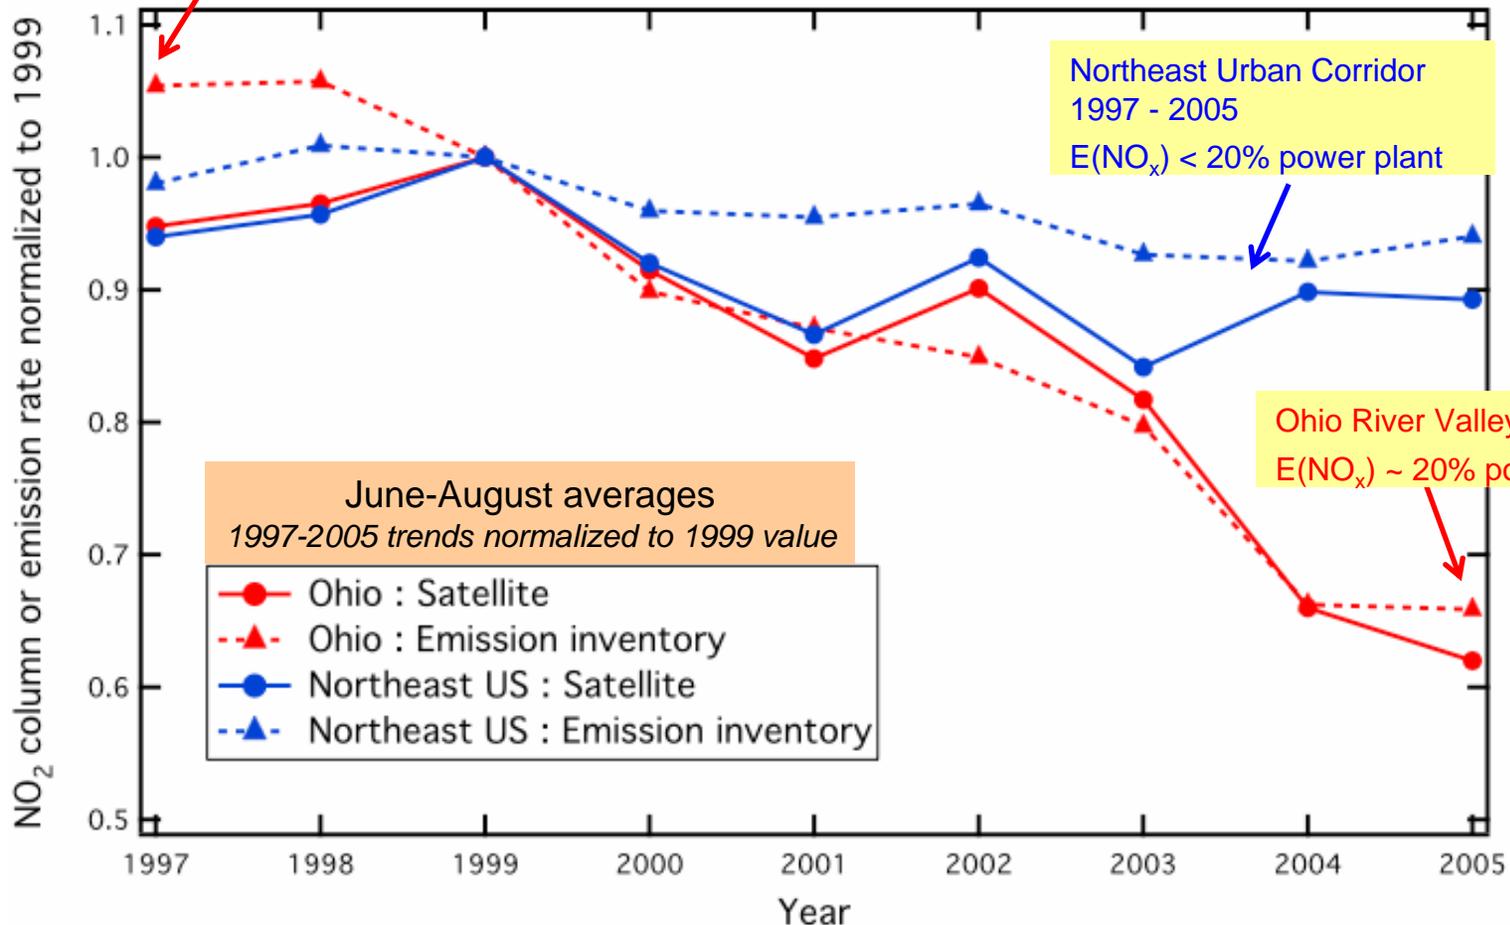

▪ slope = 1.15,  $r = 0.85$

➤ *Satellite detects changes in Ohio River Valley from recent power plant NO<sub>x</sub> emission controls*

# Annual Changes in Satellite NO<sub>2</sub> Columns and Emissions

Ohio River Valley 1997  
E(NO<sub>x</sub>) ~ 50% power plant

- Satellite NO<sub>2</sub> columns = GOME (1997-2002) & SCIAMACHY (2003-2005)
- Bottom-up NO<sub>x</sub> emission trend derived from monthly CEMS reports assuming all other NO<sub>x</sub> sources constant at summer 1999

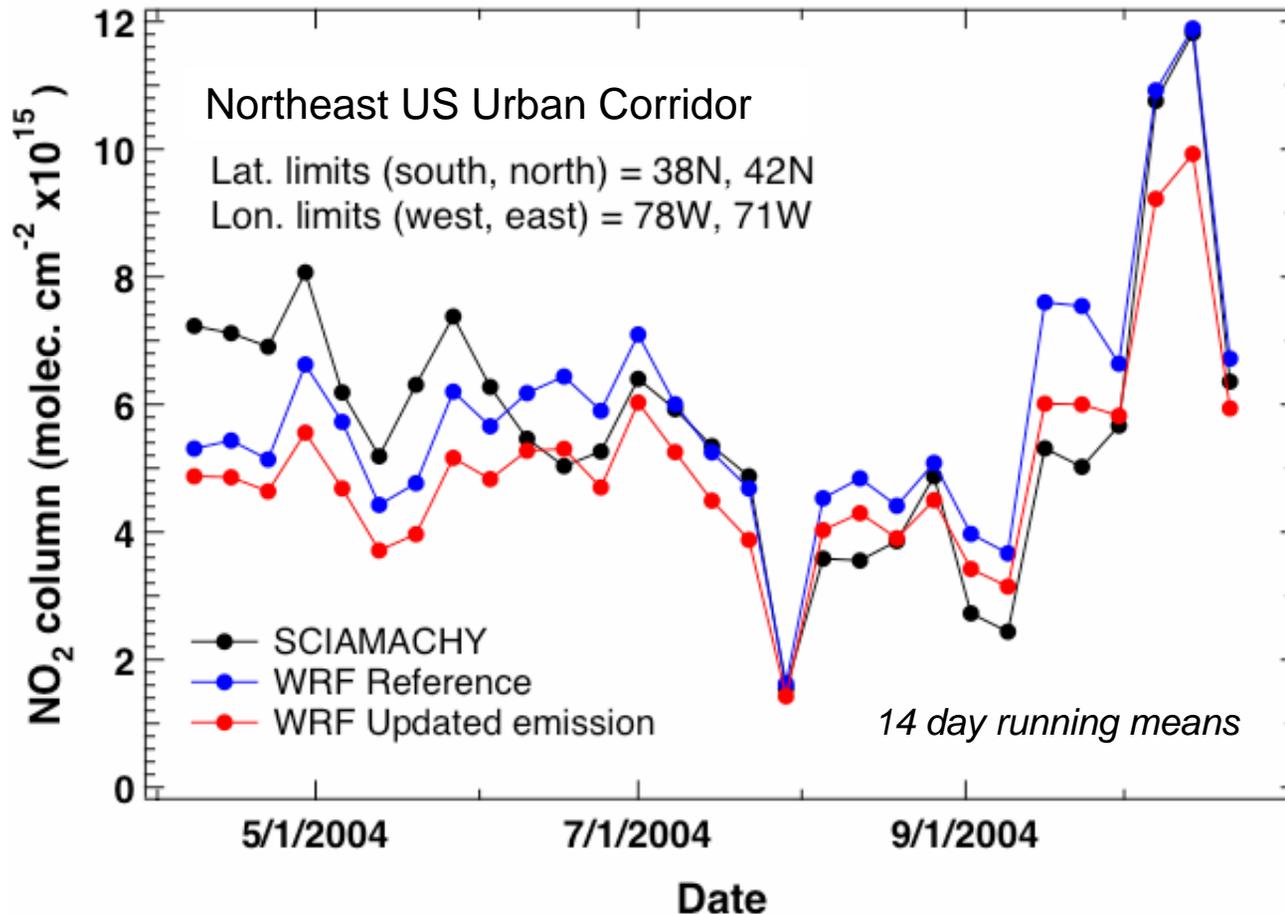

Northeast Urban Corridor  
1997 - 2005  
E(NO<sub>x</sub>) < 20% power plant

Ohio River Valley 2005  
E(NO<sub>x</sub>) ~ 20% power plant

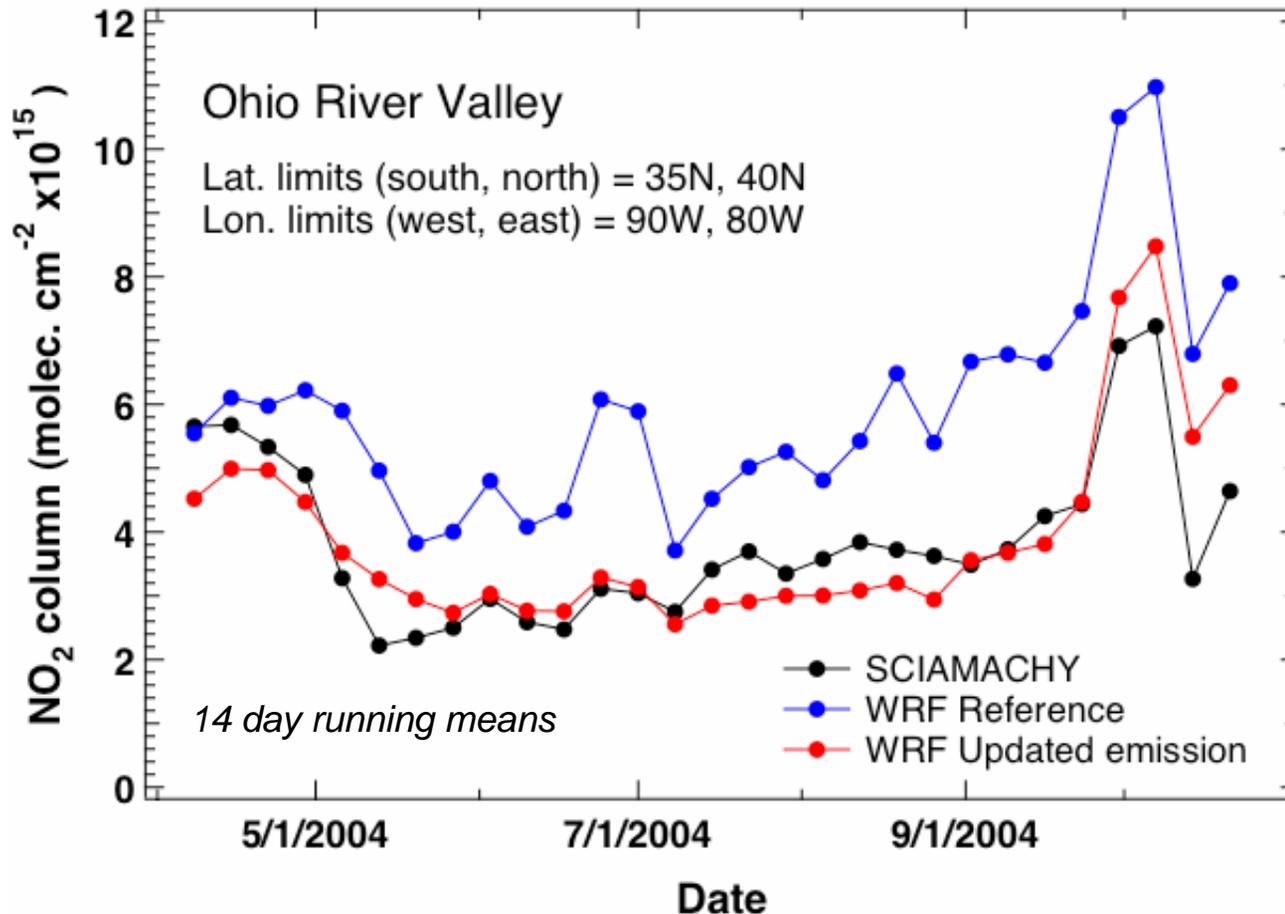

- Similar trends in satellite NO<sub>2</sub> columns and NO<sub>x</sub> emissions
  - Power plant NO<sub>x</sub> controls have affected NO<sub>2</sub> columns
  - Mobile NO<sub>x</sub> emission changes smaller than those for power plants

# Seasonal Changes in Satellite and Model NO<sub>2</sub> Columns

- Summer NO<sub>2</sub> columns < spring & fall NO<sub>2</sub> columns
  - Decreased NO<sub>2</sub> lifetime in response to higher solar actinic flux
    - Satellite detects seasonal changes due to natural photochemical cycle
- Model agrees well with satellite ( $r = 0.83$  for either emission inventory)
  - Model captures variability caused by meteorology

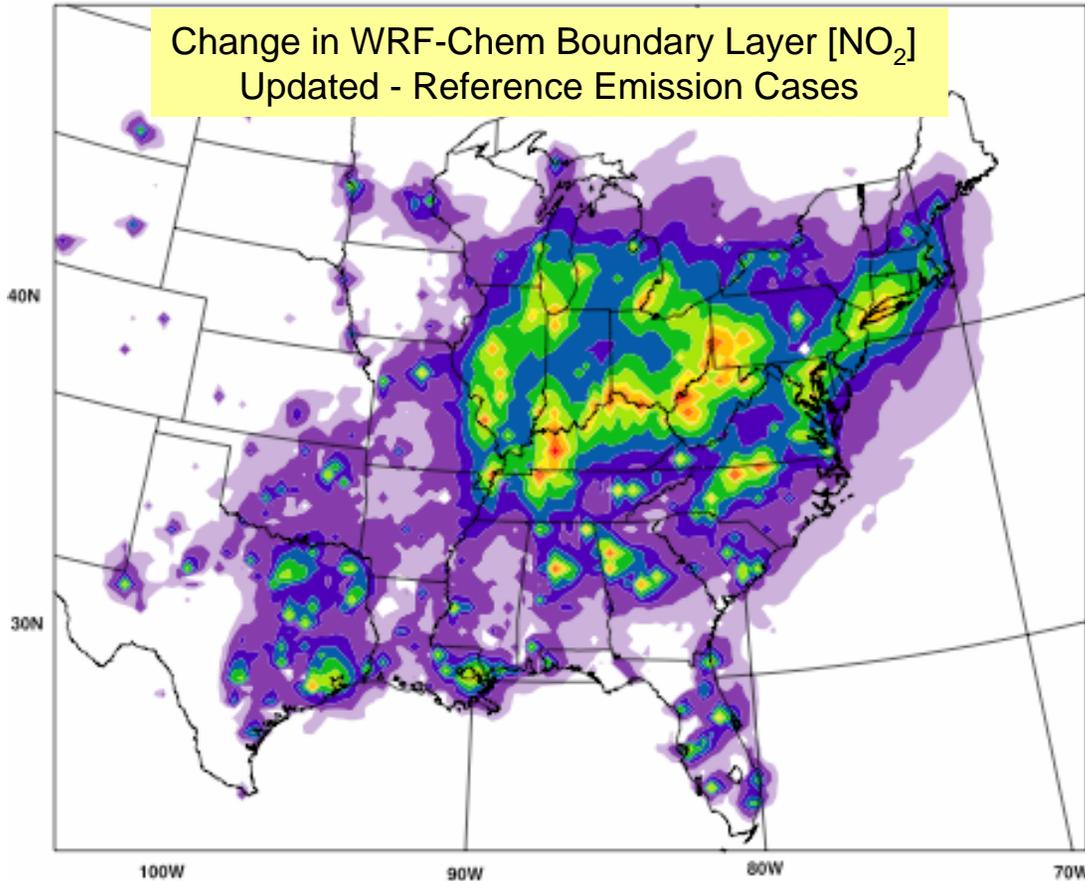

# Seasonal Changes in Satellite and Model NO<sub>2</sub> Columns

- Summer NO<sub>2</sub> columns << spring & fall NO<sub>2</sub> columns
    - Point source NO<sub>x</sub> controls target summer emissions
  - Good model - satellite agreement requires monthly 2004 power plant emissions
    - $r = 0.59$  (reference emissions),  $r = 0.70$  (updated emissions)
- Satellite detects seasonal changes due to summer use of power plant pollution controls

# Boundary Layer NO<sub>2</sub> Response to NO<sub>x</sub> Emission Reductions

Change in WRF-Chem Boundary Layer [NO<sub>2</sub>]  
Updated - Reference Emission Cases

Max. = 0.26 / Min. = -10.02 (ppb)

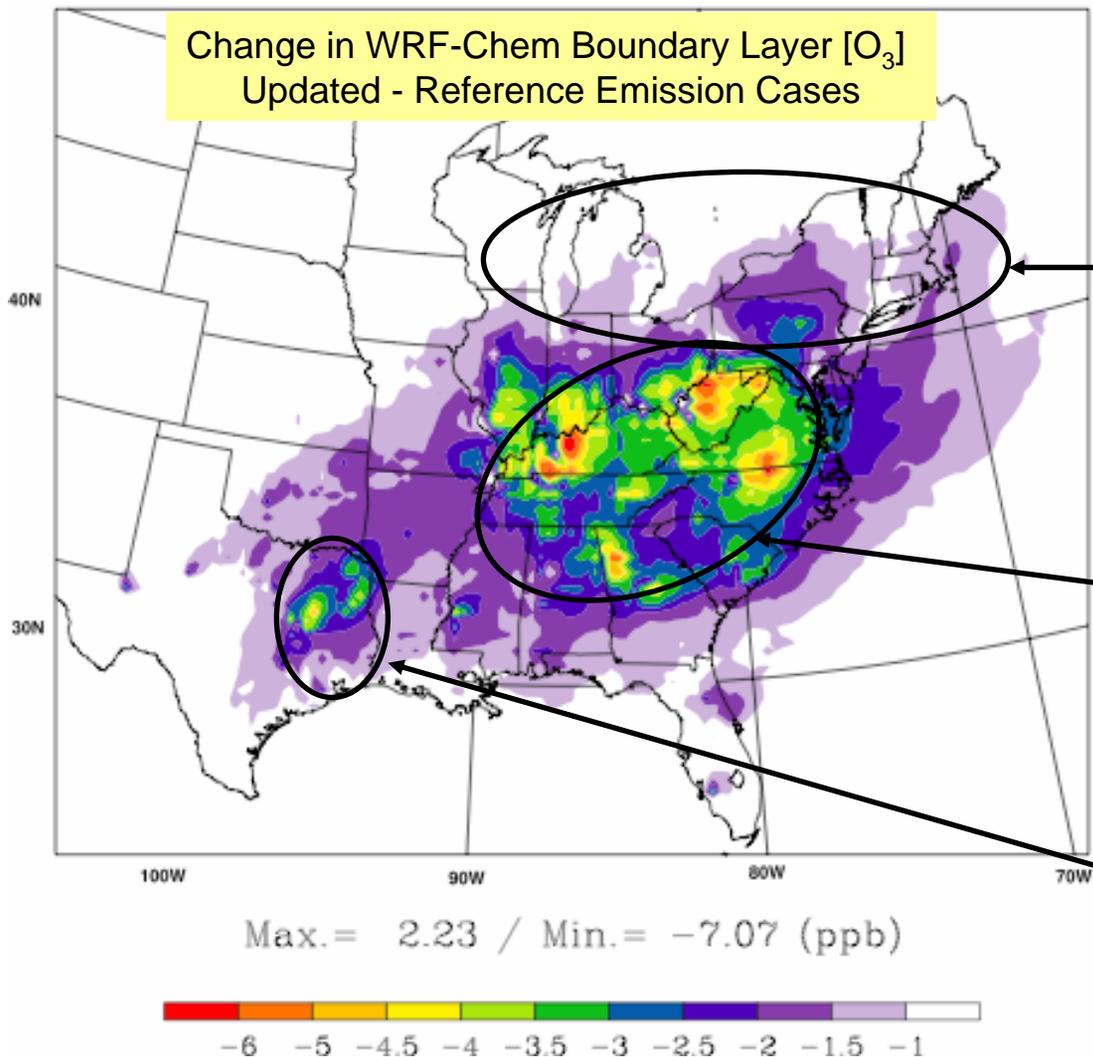

*Average of all model output between 0 & 1 km at 20 UTC  
(1500 EST) for all days June-August 2004*

- Largest reductions near power plants that installed controls between 1999 and 2004
- Maximum  $\Delta[\text{NO}_2] = -10$  ppbv for reference case  $[\text{NO}_2] = 12$  ppbv

# Boundary Layer O<sub>3</sub> Response to NO<sub>x</sub> Emission Reductions

Change in WRF-Chem Boundary Layer [O<sub>3</sub>]  
Updated - Reference Emission Cases

- O<sub>3</sub> generally decreases in response to power plant NO<sub>x</sub> emission reductions

- Small  $\Delta[\text{O}_3]$  in northern US states  
⇒ persistent cold fronts and unusually cold conditions in summer 2004

- Large decreases in Ohio River Valley, VA, NC, and GA

- Maximum  $\Delta[\text{O}_3] = -7$  ppbv for reference case  $[\text{O}_3] = 72$  ppbv

- Differences in  $\Delta[\text{O}_3]$  for comparable  $\Delta E(\text{NO}_x)$   
⇒ influence of biogenic E(VOC)

Average of all model output between 0 & 1 km at 20 UTC  
(1500 EST) for all days June-August 2004

## Conclusions

- Power plant  $\text{NO}_x$  emission controls  $\Rightarrow$  measurable impact on eastern US air quality
- Space-based spectrometers detect  $\text{NO}_2$  column changes in Ohio River Valley
  - Year-to-year
  - Summer vs spring/fall
- Satellite observations validate bottom-up inventories
- Model needs month- and year-specific CEMS data to simulate spatial and temporal behavior of  $\text{NO}_x$ 
  - Frequent NEI point source updates
- In response to power plant  $\text{NO}_x$  emission reductions, model predicts:
  - $\Delta\text{O}_3 = -4$  to  $-10\%$  in Ohio River Valley, Virginia and North Carolina
  - Small  $\Delta\text{O}_3$  in northeast US during cold summer of 2004
- EPA analysis of 1990 - 2004 surface  $\text{O}_3$  monitor data sees some similar trends
  - <http://www.epa.gov/airtrends/ozone.html>
  - *Evaluating Ozone Control Programs in the Eastern United States: Focus on the  $\text{NO}_x$  Budget Trading Program, 2004*
- $\text{O}_3$  monitor trends complicated by differences in...
  - Meteorological conditions
  - Changes in  $\text{NO}_x$  from sources besides power plants
  - Changes in VOC emissions
  - Model simulations needed to understand trends in surface  $\text{O}_3$  observations
- Satellite observations suggest further reductions in eastern US  $\text{NO}_x$  levels will require controls on both mobile source *and* power plant emissions
