Chapter 1: Introduction

Thank you for using this version of EPA's Electronic Reporting Tool (ERT). Please keep checking <http://www.epa.gov/ttn/chief/ert/index.html> for the latest version of ERT and the user's manual.

What is the ERT?

The ERT is used to electronically create and submit stationary source sampling test plans and reports to regulatory agencies, provide a means for regulatory agencies to give comments on a test plan after approval to document the test program, calculate results and submit (or resubmit) the test results as an electronic report to the regulatory agency. Additionally, the ERT provides a means for individuals to review and comment on the submitted test report. Certain EPA regulatory programs require the use of the ERT to submit compliance tests. The ERT allows one to create a compressed submittal package, which consists of the test data and an XML export file. Users can then send the submission package file to the EPA's Central Data Exchange (CDX). The test reports will then be stored in the EPA's WebFIRE database [<http://cfpub.epa.gov/webfire/>].

ERT Main Parts

When you open the ERT for the first time, you will see the Microsoft Access Application. The application, which consists of the main screen, internal screens and menu buttons, allows one to create a Project Data Set (PDS). The PDS contains all of the information required, plus any attachments. The Microsoft Excel spreadsheet is an optional part of the ERT. You can use it to enter manual source test data and subsequently import that data into the ERT.

ERT Application

The ERT Application is a Microsoft Access Database. To run the ERT, you must have Microsoft Access 2007 or 2010 or the runtime version of Microsoft Access (which is available for free on the ERT website). Before running the ERT for the first time, please refer to [Chapter 2: Before You Begin](#) for instructions.

Project Data Set

The Project Data Set (PDS) is a Microsoft Access Database file generated by the ERT Application which, depending on the stage of completion, may contain the Test Plan, Test Plan Review (by the Regulatory Agency), Test Report Data and/or Test Report Assessment (by the Regulatory Agency). This is the file that will be exchanged between the source test contractor, the client and the state agency, and the EPA. Each PDS contains information for test reports from one emissions source. When you create a new PDS, you are prompted for a file name for the PDS that is created. The file is created automatically in a "**ProjectData**" directory by the ERT. You may change the location of the "**ProjectData**" directory if you wish. The last PDS used is remembered by the ERT when restarted. There is no limit on the number of PDS files, but only one PDS can be opened at a time.

Excel Spreadsheet

The Excel spreadsheet can be used as an option for entering manual test data into the ERT. Manual test run data can be entered into the spreadsheet and then imported into the ERT. Users have the option of incorporating this spreadsheet into their legacy spreadsheets and then importing the data into the ERT.

Basic Workflow

The basic work flow is as follows, though other work flows are possible:

- Source Test Owner
 - Creates a partial test plan with basic information on facility and process requiring testing and target analytes to be included.
 - Emails the ERT PDS to source test company for completion.
- Source or Testing Company
 - Creates the test plan/report [Note: The test *plan* is part of the test *report*. You have the option to submit a test *plan* to the regulatory agency before testing, but it is not required].
 - Creates the ERT Submission Package File.
 - Submits the ERT Submission Package File to regulatory agency.
- Regulatory Agency
 - Reviews test plan, **if** submitted, communicates with source/testing company, as necessary.
 - Approves test plan or marks areas where more information is needed.
- Source or Testing Company
 - Updates the test plan, **if** requested by the regulatory agency, creates new ERT Submission Package File, and resubmits to the agency.
 - **If** approved by regulatory agency, performs testing.
 - Enters run data into spreadsheet or directly into the ERT.
 - Enters lab data into the ERT.
 - Attaches supporting documentation.
 - Creates the “ERT Submission Package” file.
 - Submits the “ERT Submission Package” file to Regulatory Agency or EPA.
- Regulatory Agency
 - Reviews test report.

Chapter 2: Before You Begin

Here are some tips to help complete each section of the ERT.

Test Plan

Completing the test plan accomplishes two interrelated processes in the ERT. First, it is the vehicle used to inform all the parties associated with the planned test program of the needed details about the specific process unit to be tested, the test matrix (test methods, number of runs, duration of runs, analytical finish, etc), process information to be collected and QA/QC activities, safety requirements. Second, the test plan provides the foundation for the test report since all of the information that is in the test plan is used in some aspect of a comprehensive test report.

Although, the operating permit is not needed to input the minimum information required to complete a test plan in the ERT, it is recommended that a copy of the operating permit for the affected source be available. The permit will provide most of the site identification information needed for the ERT.

Test location information, process descriptions, air pollution control device information and parameter monitoring information are the same as normally required for test plans (see EPA Emissions Measurement Center Guideline Document 42, Preparation and Review of Site Specific Test Plans <http://www.epa.gov/ttn/emc/guidlnd/gd-042.pdf>).

The ERT requires detailed process information. This information is important in properly characterizing the emission process and is necessary for EPA to develop and update its emissions factors (EF) database. EF are typically represented as a mass rate of emissions per process parameter (i.e. lb pollutant/ton of product made). The process data are needed to determine the value of the denominator. **Required** facility and process information includes, but is not limited to:

- Process rate information,
- Source Classification Code (SCC)
Facility Registration Number, and,
- Air Pollution Control Device (APCD) operating parameters.

Manual Sampling Data

The ERT allows entering run field data two ways:

1. Entering data into the ERT spreadsheet and then importing the data into the ERT.
2. Entering the data directly into the ERT.

The spreadsheet option is provided for user's that are more comfortable using spreadsheets. The ERT spreadsheet provided may also be incorporated into user's proprietary field data spreadsheets. Users can link cells from their spreadsheets to the cells in the ERT spreadsheet. This allows for quicker data entry into the ERT and reduces the likelihood of key punch errors.

The ERT has been designed to accept data for most of the individual test methods commonly used today. Although we recognize that some test methods may be combined to minimize the number of sample trains in operation, ERT has not been set up to include all possible combinations. Therefore, if a single train is used for multiple methods which the ERT is not currently capable of combining (example: Method 5 and Method 8), data for each method must be entered into the ERT separately. To avoid the need to enter the same run data multiple times, we recommend the use of the included Excel spreadsheet and importing the data into each method, as appropriate.

Instrument Sampling Data

At this time, the ERT requires manual entry of instrumental test data, which is input by location and method. To allow for automatic calculation of system bias and linearity, each calibration standard must be entered into the ERT under item 16 of the Test Plan tab.

Chapter 3: Getting Started

Verify that you have a Version of Microsoft Access that will Run the ERT

If you have Microsoft Access version 2007:

- Verify that you have at least Service Pack 2 installed. Open Microsoft Access, click on the MS circle in the upper left corner of the Access window, click on “**Access Options**” at the bottom of the window, click on “Resources” in the left column. At the bottom of the window just below the text “about Microsoft Office Access 2007” the software (Microsoft Office Access 2007) and the Service Pack level is identified. If Service Pack 2 is installed, the text “SP2 MSO” will be between two sets of numbers that are in parentheses. If you do not have Service Pack 2 installed, click on “**Check for Updates**” and follow the directions to install the updates from Microsoft. Many corporate computers do not allow users to install software and you will need to contact your information technology center and have them update your software.

If you have Microsoft Access version 2010: Any Service Pack level is acceptable in order to run the ERT Application.

If you do **NOT** have Microsoft Access:

- You will need to download and install the runtime version of Microsoft Access from the Microsoft Access Download Center. A link to the download center is provided on the EPA ERT website.
- After installing the Runtime version of Microsoft Access, follow the instructions below to install and run the ERT.

Downloading and Installing the ERT

The EPA website <http://www.epa.gov/ttn/chief/ert/index.html> contains the latest versions of the ERT, the spreadsheet, the user’s guide, and example data sets.

Once you’ve determined that you are running a version of MS Access which is capable of running the ERT Application, follow these two steps.

1. Download the latest versions program files. This file includes the latest version of the ERT and the user’s guide.
2. To run the ERT, right click on the downloaded zip file and select “**Extract All**”. Select a destination for the extracted files. Go to the destination folder and double click on ERT4.accdb file.

Example Data

The EPA's website also contains example data for use with the ERT. Download the files from the ERT Project Data Set example link. This file includes an example Project Data Set (PDS) and the associated spreadsheet. Unzip the files to your hard drive and use the ERT to select the Example Data V3.mdb file. See the [Selecting a Project Data Set](#) section for more information on selecting a PDS.

Starting the ERT

To start the ERT, double click ERT4accdb file from the location where you've installed the ERT application.

Depending on how your version of Access is configured, you may see a "Security Warning" window (as shown below) when you try to start the ERT.

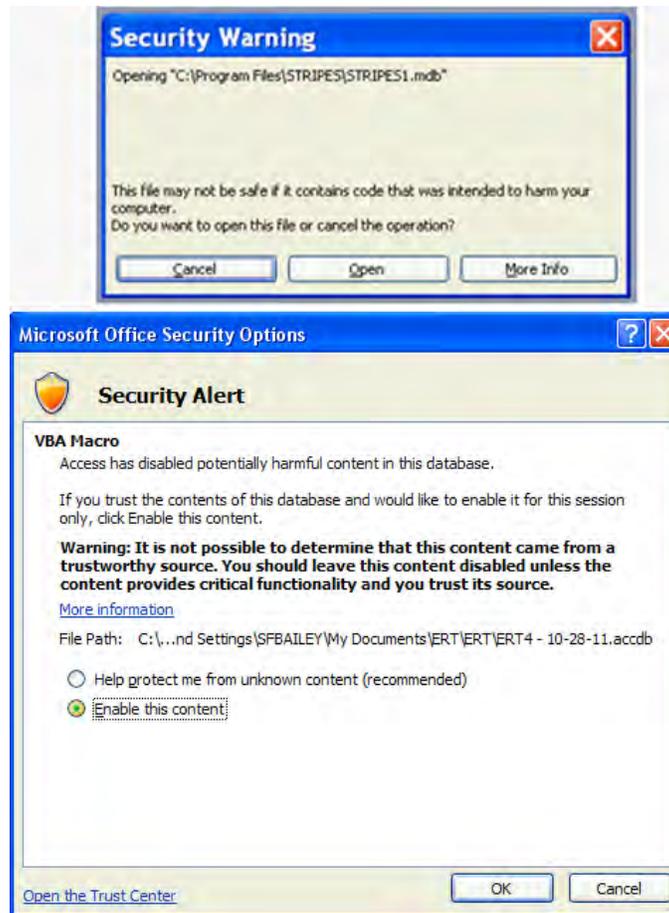

Figure 1 - Security Warning

If the warning (or a similar one) appears, click the **“Open”** button to continue loading the ERT into Access. If the bottom alert appears, select **“Enable the content”** and click the **“OK”** button. There may also be a compatibility warning. Click the **“X”** to close. If you want to avoid these warnings in the future, you can make the ERT directory and all subdirectories **“Trusted Locations.”** To make this

directory a trusted location, close the ERT application, open Microsoft Access, click on the MS circle in the upper left corner of the Access window, click on “**Access Options**” at the bottom of the window, click on “Trust Center” in the left column, click on “**Trust Center Settings**”, click on “**Trusted Locations**”, click on “**Add new location**”. Browse for the location or directory where you saved the ERT application (the file ERT4.accdb), select this location and click on the box to the left of “**Subfolders of this location are also trusted**” to enable these locations. Click on “**OK**”. Verify that the path that you selected is one of the trusted locations. Click “**OK**” to close the trust center window then the Access Options window. Close Access. Reopen the ERT application.

After the “**Trust Center Settings**” have been established, the first time any new version of the ERT loads, the “**ERT Main Menu**” will look like Figure 2 - ERT Welcome Screen and Main Menu. The only selection options available are “**Select Project Data Set**”, “**Create New Project Data Set**” and “**Help / Sys. Reports.**” All other selection buttons are either not selectable (the button is dimmed) or produce no useful function when selected.

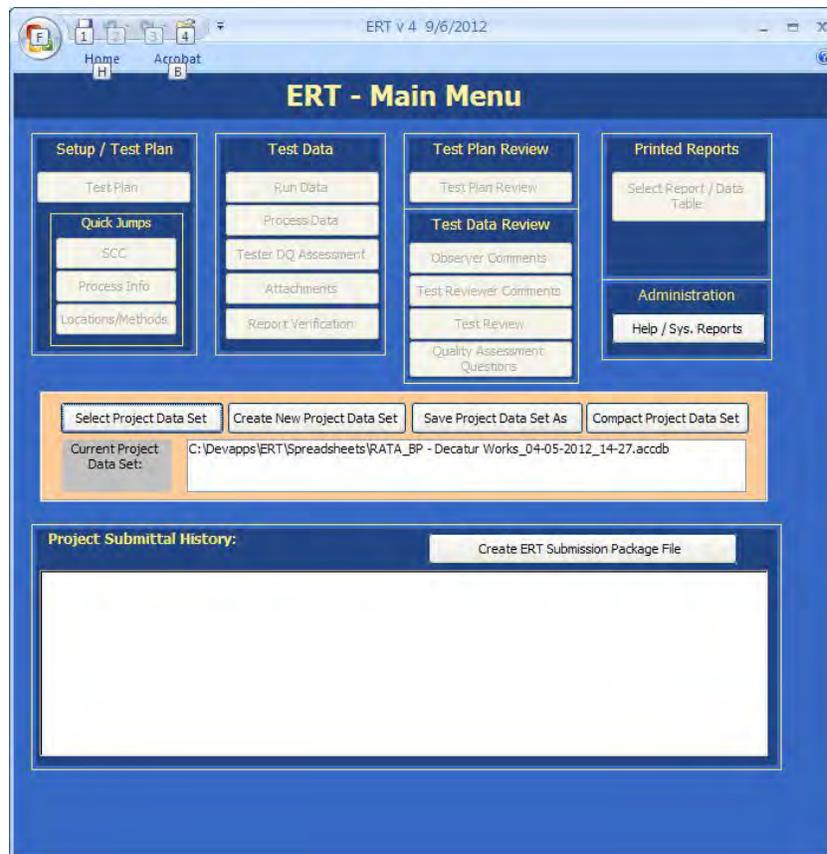

Figure 2 - ERT Welcome Screen and Main Menu

Project Data Sets

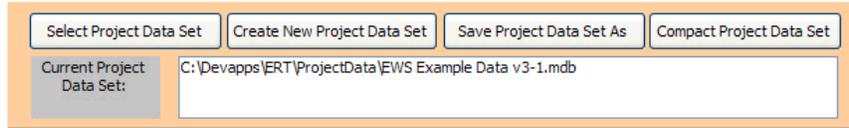

Figure 3 - Project Data Set Area of the ERT Main Menu

The PDS is a Microsoft Access file that contains all of the information for all the source tests performed at a single emissions source. This includes the test plan, run data, test report, test review and any supporting documentation that has been included as attachments.

When the PDS is sent to the regulatory agency, the agency can use the ERT to review and approve the PDS for the source test. When attachment file sizes are small, the ERT's file can be emailed through many corporate, commercial, state and Federal email systems.

You can select, create, save as, or compact a PDS from the “*ERT Main Menu*”. The first time you create a PDS, you will select “*Create New Project Data Set.*” Thereafter, you can select the project data set and click on “*Save Project Data Set As*” to save the entire PDS with another name or to save only the test plan part of the first data set as a template.

Creating a Project Data Set

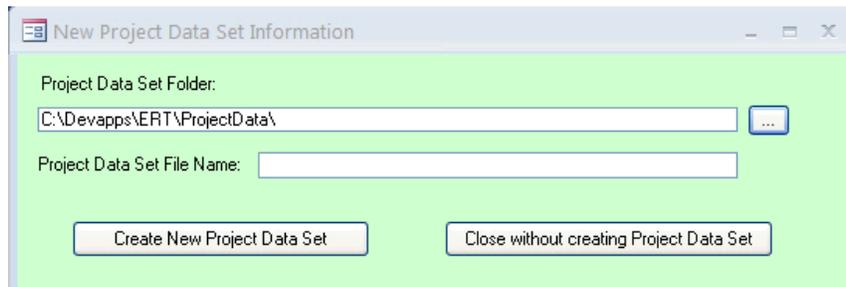

Figure 4 - Project Data Set Area of the ERT Main Menu

- Click “*Create New Project Data Set*” from the “*Project Data Set*” area of the ERT main menu.
- Then browse for the location of the folder to store the PDS or let it stay in the default folder.
- Enter a name for the PDS file in the “Project Data Set File Name” box
- Click “*Create New Project Data Set*” to create a PDS with the name you entered in the folder you created.

Selecting a Project Data Set

- Click “**Select Project Data Set**“ from the *project data set* area of the ERT Main Menu. A “**Browse**” menu like shown in Figure 5 will appear.
- Select the PDS from the default folder (ProjectData) or browse to the folder containing the desired PDS and select the file and click “**Open**”.

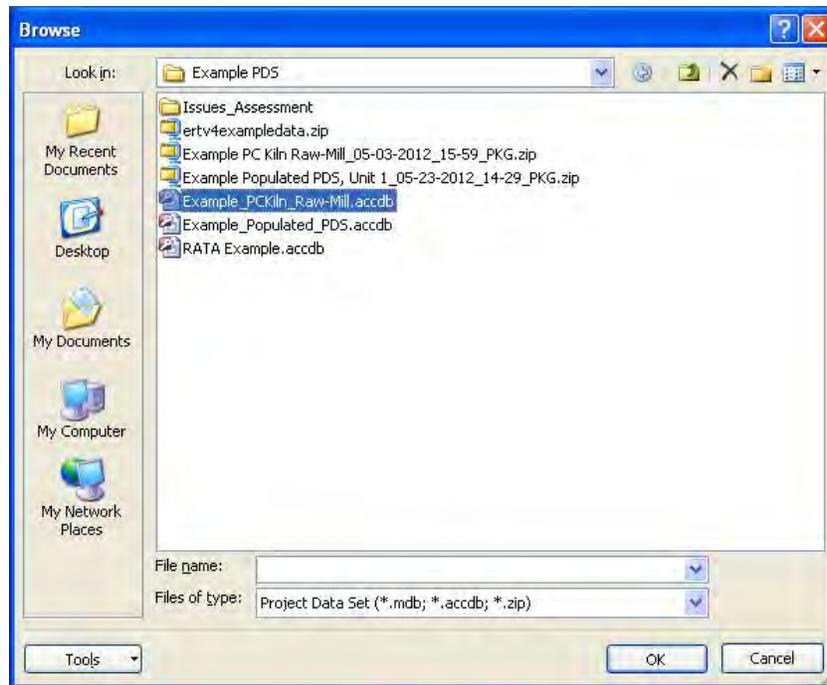

Figure 5 - Select Project Data Set Window

Performing a Save As on a Project Data Set

Source tests for similar sources may contain some of the same information. To keep from having to enter the same information for similar tests, the ERT has the ability to save the currently selected PDS as a template. When this happens, a new PDS is created with the current test plan information saved and all the other data deleted. The new template PDS can then be used as a starting point for a similar source test. The ERT also has the ability to save all of current PDS data into a new PDS.

- Click “**Save Project Data Set As**“ from the ERT main menu. The window shown in Figure 6 will appear.
- Click “**Yes**“ to save the current PDS as a Template (saving test plan data only).
- Click “**No**“ to save the current PDS (saving all data).
- Click “**Cancel**“ to cancel the operation.

Figure 6 - Save Project Data Set As Window

Note: If your original PDS has an “mdb” extension or was created in ERT version 3 (you cannot see the paperclip image in the Attachments tab), you will encounter problems with some attached files. The old PDS files have an OLE object field instead of an attachment file type. As a result; PDS file sizes in ERT version 3 are greater than ERT version 4. In addition, very large attachments may not be able to be viewed because of memory constraints. You should revise the PDS file to the ERT version 4 file type which has an .accdb extension. If you create a new PDS you will see the paper clips. If the existing PDS is extensive and was created in ERT version 3, you can change the PDS to a version 4 format by: 1) Save all the attachments in the old ERT file using a descriptive file name for each attachment, 2) Create a new blank PDS using ERT version 4. 3) Close ERT, open MS Access and load the blank PDS, 4) Delete all the tables in the PDS except “tblAttachments”, 5) In the Access menu, select “External Data” then select “Import” “Access”, 6) Use “Browse...” to locate the ERT version 3 PDS, 7) Specify the importing of all tables, queries, forms ... 8) Click “OK”, 9) Select the “Select All” button, 10) Deselect “tblAttachments” and click “OK”, 11) Close Access and open the new PDS.

Compacting a Project Data Set

Microsoft Access files can be very large. By clicking on “***Compacting a Project Data Set***” you can reduce the file size. This will not affect the quality of content of the file.

- Click “***Compact Project Data Set***” from the project data set area of the ERT main menu – a message will alert you when the process is complete.

Project Submittal History/Creating the ERT Package for Regulatory Agency Submittal

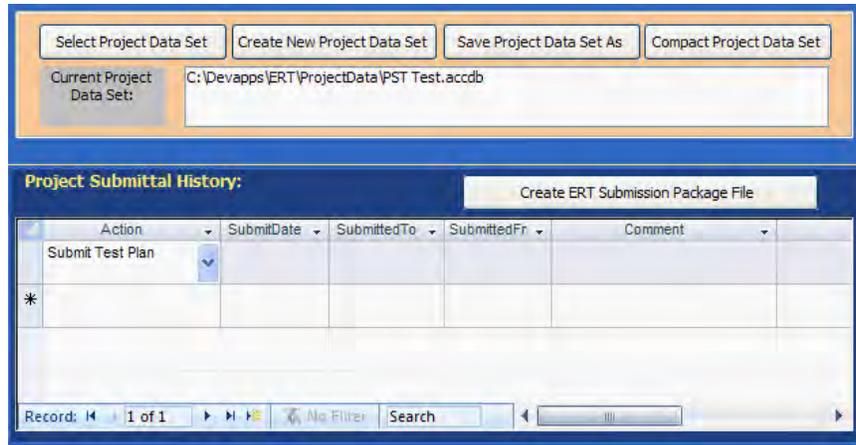

Figure 7 - Project Submittal History Area of the ERT Main Menu

The “*Project Submittal History*” area of the ERT allows you to create an ERT submission package file and keep track of where the PDS is in the workflow of the source test process. (Please see the previous *Basic Workflow* section for more information on the workflow process). At the completion of each step (test plan, test plan review, test report, test report review / approval), the action, the date submitted, to whom it is being submitted, who made the submission, and any special comments are entered into this area.

To create a submission file, click “**Create ERT Submission Package File**” which will activate the file preparation menu shown in Figure 8.

Figure 8 - Create ERT Submission Package File menu.

Location	Method	RunNumbe	Proci	SCC
Stack	Method 10	1	1	10200701
Stack	Method 10	2	2	10200701
Stack	Method 10	3	2	10200701
Stack	Method 23	1	1	10200701
Stack	Method 23	2	2	10200701
Stack	Method 23	3	2	10200701
Stack	Method 25A	1	1	10200701
Stack	Method 25A	2	2	10200701
Stack	Method 25A	3	2	10200701
Stack	Method 26A	1	3	10200701
Stack	Method 26A	2	3	10200701
Stack	Method 26A	3	4	10200701
Stack	Method 29	1	3	10200701

Figure 9 - Project Submittal History Step 1

Click on the number 1 to “**Set/Review Test and Process Run Associations**” and you will see the above screen. This allows you to associate the process data with the test run data. Even if you

associated process data with test run data in the emissions tab of the run data details screen, you will need to make the associations in this screen. **THIS IS REQUIRED FOR SUBMITTING TO EPA.** Successful association of the data will result in a table, as in Figure 9. Click on “*View WebFire Export*” to see results in spreadsheet format.

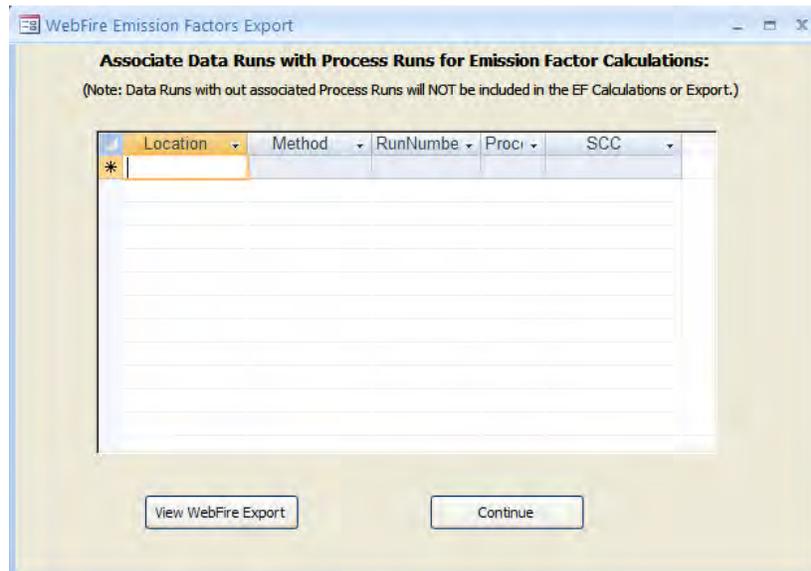

Figure 10 - Project Submittal History Step 1 of New Project with no associated data

When submitting a PDS with only test plan data there will be no run or process data to associate. Simply click on “*Continue*” to skip this process and continue creating the submission package file.

Click on “*Continue*”.

Figure 11 - Project Submittal History Step 2

Click the number 2 to ***Enter Project Data Set Submittal Data***. This will activate the fields so that the data can be entered. Select the action from the dropdown list and enter the other information in the fields. The actions are:

- ***“Submit Test Plan”***,
- ***“Notice of Deficiency - Test Plan”***,
- ***“Resubmit Test Plan”***,
- ***“Approve Test Plan”***,
- ***“Submit Test Report”***,
- ***“Notice of Deficiency - Test Report”***,
- ***“Resubmit Test Report”***,
- ***“Approve Test Report”***,
- ***“Request Additional Information”*** and
- ***“Other”***.

While you may create a submission file without entering information in all the fields, this information will be saved in the ***“Project Submittal History”*** as documentation of the activities associated with the source test program.

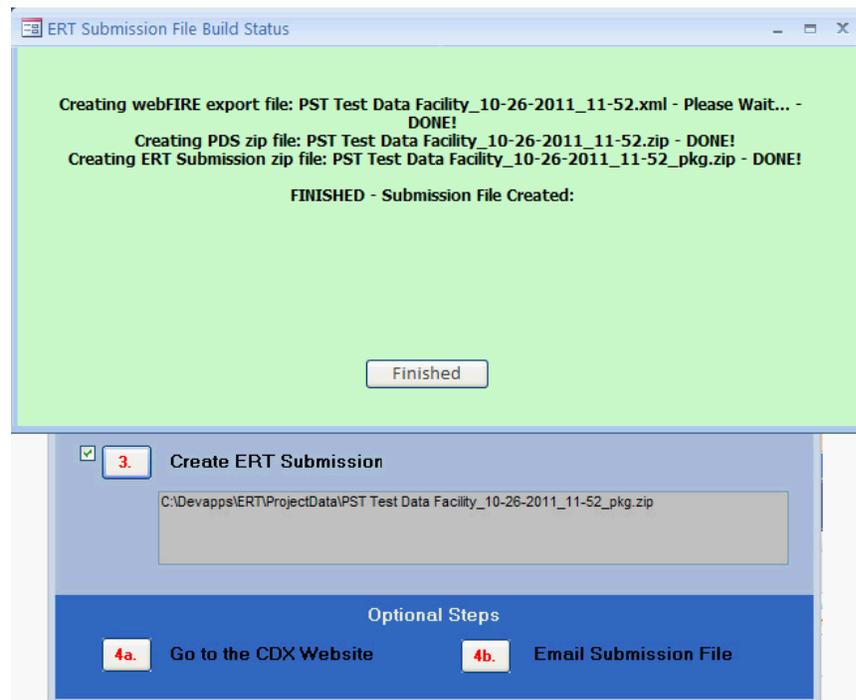

Figure 12 - Project Submittal History Step 3

Click on number 3 “*Create ERT Submission.*” An action window will appear with instructions as it creates the ERT Submission file, a PDS zip file and an ERT Submission zip file. When the Finished button is clicked, the location of the field will be reported in the field.

If the internet is active, by clicking on 4a, “*Go to the CDX Website*”, you will be linked to the CDX website. By clicking on 4b, “*Email Submission File*”, the local email will open with a reminder to attach the file from the provided location.

NOTE: If clicking on 4a Go to the CDX Website generates a “*Cannot Connect to Proxy Error*”, then click on “*Internet Options*”, click on “*Advanced*”, and check to be sure the SSL and TLS protocols are enabled under the security section.

Chapter 4: Create Test Plan/Test Report

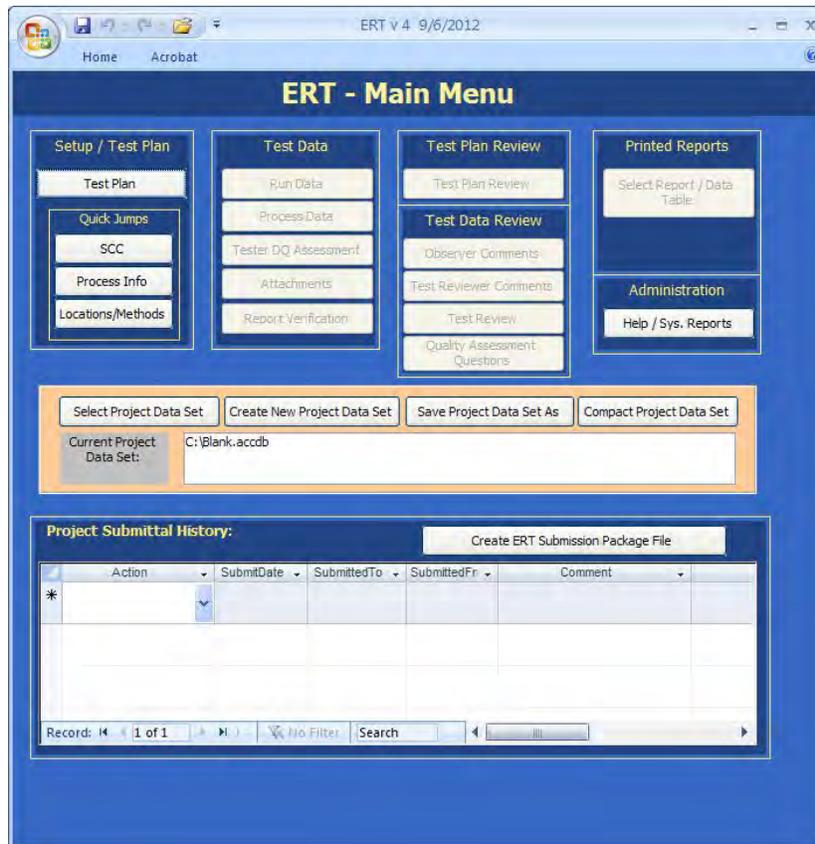

Figure 13 – The ERT Main Menu

Figure 13 shows the functional areas of the *ERT Main Menu*.

- “*Setup / Test Plan*” with quick jumps:
- “*Test Data*”,
- “*Test Plan Review*”,
- “*Test Data Review*”,
- “*Printed Reports*”,
- “*Administration*”,
- “*Project Data Set*” and
- “*Project Submittal History*”.

If you are working with a new (empty) project data set (PDS) you will only be able to access the “*Setup / Test Plan*” functions of the ERT. After you have completed entering the setup information, you will be able to access the other menu items. If you have already entered data into a PDS (or will be working with the example dataset provided on the website) and it has not already loaded, click the “*Select Project Data Set*” and follow the file select dialog instructions.

(* required fields)

Figure 14 - Test Plan Facility/Tester Tab

Data Entry Process

To begin the data entry process, click “**Test Plan**” in the “**Setup / Test Plan**” on the ERT main menu. The screen shown in Figure 14 will appear. This screen contains a series of data entry tabs that cover the information required for a test plan/test report. [Recall a test *plan* is not required by the EPA to be submitted. However, a state agency may require/request that it be sent to them. Keep in mind, these fields should be filled in before a submission package file is submitted] There are 10 tabs or sections in the test plan module: “**Facility/Tester**”; “**Permit/SCC**”; “**Regulations**”; “**Process/APCD**”; “**Locations/Methods**”; “**Methods cont.**”; “**Audit/Calibrations**”; “**Schedule**”; “**Signatures**”; and “**Attachments**”.

Requested Information

The information requested has been selected to adequately characterize a facility, the regulatory use of the data, and what tests are to be performed. In general, providing this information will give the test plan reviewer enough information to evaluate the test plan without needing additional information. However, it is not possible to create a generic list of information that includes all the information for all test plan scenarios. Use comments and attachments to provide information in the test plan to facilitate review whenever possible. Complete all sections to speed up the test plan review and approval process. You may access specific sections of the test plan data entry form by clicking the other control buttons on the ERT main menu (e.g. “**Locations/Methods**”).

Screen Navigation

Move from one section to the next by clicking the “*Next Page*” button located in the bottom right corner of the screen or by clicking on the desired tab of the data entry form. You will generally have two options for entering data in the form, either typing in the spaces provided or using the copy and paste method to extract information from other electronic documents.

Screen Help Tips

Moving the cursor over the blue circled question mark displays a “pop up” help tip window that provides a detailed description of what is needed for that field.

Facility/Tester Screen

Enter information about the facility and the testing company. The fields are as follows:

- Facility Name:*** The public or commercial name of the facility site (i.e., the full name that commonly appears on invoices, signs, or other business documents).
- Address:*** The address that describes the physical (geographical) location of the front door or main entrance of a facility site, including urban-style street address or rural address.
- City:*** The city in which the facility resides.
- State/Zip:*** The two letter state and mailing zip code in which the facility resides.
- County:*** The county or parish in which the facility is located. One use of this information is a search criteria to identify a facility which is in the regulatory jurisdiction of a local or tribal agency.
- Contact:*** The person with knowledge of the facility’s operations during the test program who can assist reviewers of the test plan or test report if they have questions.
- Phone:*** The phone number of the contact or the facility.
- Fax:*** The facsimile number of the facility through which the contact can assist the reviewers (optional).
- Email:*** A working email address of the contact which can be used to assist the reviewers.
- AFS Number:*** EPA AIRS Facility System (AFS) number.
- Industry NAICS:*** North American Industry Classification System.
- FRS:*** EPA Facility Registry System number (FRS).
- State ID:*** The state identification number as provided by a state air pollution control agency.
- Latitude:*** Latitude of emission release point (typically the stack), with a minimum of 5 decimal places.
- Longitude:*** Longitude of emission release point (typically the stack), with a minimum of 5 decimal places.

- Testing Company:** The public or commercial name that commonly appears on invoices, signs or other business documents.
- Address:** The standard address used to send mail to an individual with the source test company.
- City:** The state in which the source test company resides.
- State/Zip:** The two letter state and mailing zip code of the source test company.
- Contact:** The person with knowledge of the design and conduct of the source test program.
- Phone:** The phone number of the source test company through which the contact can assist the reviewers.
- Fax:** The facsimile number of the source test company through which the contact can assist the reviewers (optional).
- Email:** A working email address through which the contact can assist the reviewers.
- Testing Company Project Number:** The assigned project number for the testing project by the test company (optional).

Note: If you have access to the Internet, clicking on “Search on the Web” will connect to a website that will allow you to search for your NAICS or FRS number.

Permit/SCC Screen

The screenshot shows the 'Permit/SCC' tab in a software application. The 'Test Plan Title' is 'BP - Decatur Works, Decatur AL - AB8103 RATA-2012' and the 'Test Plan Date' is '12/11/2011'. The 'Air Permit Number' is '712-0002-X058'. The 'Permitted State Source ID/Name' is 'AB8103 Hot Oil Furnace'. The 'Permitted Maximum Process Rate' is '178.3 MMBtu/hr', the 'Maximum Normal Operation Process Rate' is '100-150 MMBtu/hr', the 'Target Process Rate for Testing' is '90 MMBtu/hr', and the 'Operational Hours Per Year' is '5500'. The 'SCC' section shows a 'Select SCC from list' button and a selected SCC of '10200601' with the description 'External Combustion Boilers - Industrial - Natural Gas - > 100 Million BTU/hr'. The 'Target Parameter' is 'Heat Input' and the 'Process Rate' is 'Million Btus/hr'. The 'Pollutant Unit of Measure' is 'Lb/hr'. There are 'Previous Page' and 'Next Page' buttons at the bottom right. A red note at the bottom left indicates '* required fields'.

Figure 15 - Test Plan Permit/SCC Tab: Resulting SCC

The “*Permit/SCC*” tab screen is where permit information is inputted, including process rate information. Also, this is where the Source Classification Code (SCC) is selected by clicking on the “*Select SCC from list*” button. SCCs are 8 digit codes that represent a specific emission

process, oftentimes for a specific industry. If you do not know the correct SCC, source descriptions in the relevant section of AP-42 may provide you the code or part of the code otherwise you should contact the facility. It is very important to select the proper SCC for the emission process you've tested.

Air Permit Number:

State or Federal Permit Number.

Permitted State Source ID/Name:

Many state and local agencies have alphanumeric identifiers for individual process operating units with an associated name describing the unit. If the regulatory agency to which this test will be sent has a specific identifier for the unit tested, enter it in this location.

Permitted Maximum Process Rate: Rate as listed in Title V or state permit.

Maximum Normal Operation Process Rate: Rate as listed in Title V or state permit.

Target Process Rate for Testing: Value of the target process rate for the test program.

Operational Hours Per Year: Normal hours the facility operates in a year.

SCC/Desc:

The **Source Classification Code (SCC)** is selected through the use of the “**Select SCC from list**” button. Yellow fields are copied from another form and cannot be edited from the yellow highlighted field.

Figure 16 - Test Plan Permit/SCC Tab: Selecting SCC

Target Parameter:

For most SCC's, this field is automatically filled based on the SCC selected. For those SCC's without an established target process parameter, this will be a user established parameter.

Process Rate:

The rate units used to quantify the feed or output level of the target parameter for the source process.

Pollutant Unit of Measure:

The unit of measure for the target pollutants measured during the test. The time units in the denominator for the

process rate and the pollutant unit of measure must be the same. Additional pollutant units of measure may be selected in the “**Locations/Methods**” tab.

Target Parameter Description: Description of the identified target parameter and associated process rate and pollutant unit of measure if the text used in the fields requires clarification.

Note: The fields with yellow background are filled in automatically when the SCC is selected from the series of dropdown lists.

While many SCC’s have one or more established sets of emissions units and units for quantifying the process rate, there are also many which do not have a set of units for process rates. Figure 17 shows a short list of SCC’s where there are four SCC’s with established units for the process rate and four SCC’s where there are no established units to measure the process rate.

Description	SCC8	UNIT	MEASURE	MATERIAL	ACTION
Bleaching	30504160				
Calcining, calciner NEC	30504149				
Calcining, flash calciner	30504142	Lb	Tons	Clay	Produced
Calcining, multiple hearth furnace	30504141	Lb	Tons	Clay	Produced
Calcining, rotary calciner	30504140	Lb	Tons	Clay	Produced
Drying, apron dryer	30504132	Lb	Tons	Clay	Produced
Drying, dryer NEC	30504139				
Drying, rotary dryer	30504130				

Figure 17 - SCC selection menu with no established process units.

When a user selects one of the SCC’s where there is no established set of units for the process rate, the selection of one of these SCC’s will initiate a sub menu shown in Figure 18 which allows the user to establish a set of units for documenting the process rate variable to associate with the measured emissions. The process variable is divided into four parameters. The first parameter is the units used to measure the pollutants. A default of pounds (Lb) is pre-populated in the “**Pollutant Unit**” field. Other units may be selected either from the drop down list or users may add emissions units. Users should limit their selection to units which are available as a rate (i.e. /hr or /minute) in the “**Add Emissions/Concentrations**” area of the “**Locations/Methods**” tab (Item 7b). The second parameter is “**Measure**” which is the units used to measure the process rate. Several existing units for measure are available and include but not limited to tons, megawatt-hour, and pounds. Additional units of measure may be added should the required measurement units not be in the list. The third parameter is “**Material**.” The parameter material is the designation of what material is measured as an indicator of the process rate. As with “measure” many items are available in the drop down list of existing materials. Also, as with measure, the user may add a parameter describing the material used to describe the process rate. Lastly, “**Action**” is used to describe what action is used to describe the measured material. The drop down list includes many existing actions that have been used to describe other process rates. If the user cannot find a suitable action to describe the process rate measurement, an additional action may be added.

The SCC you selected does not have default values for the Emission Factor. Please select from the pick lists or enter this information below.

Pollutant Unit:
Emission factor unit numerator; units associated with pollutant emitted (as in "LB" in "LB of NOx per tons of coal burned")

Measure:
Emission factor unit denominator; units associated with material processed (as in "TONS" in "Lb of NOx per TONS of coal burned")

Material:
Material processed (as in "COAL" in "Lb of NOx per tons of COAL burned")

Action:
Action performed on the material (as in "BURNED" in "Lb of NOx per tons of coal BURNED")

NOTE: The Material and the Action become the Target Parameter (as in "Coal Burned")

Figure 18 - Process units' selection for SCC's with no default units.

Upon completion of the selection of the pollutant unit, measure, material and action, clicking on “**OK**” will return you to the SCC selection list where the time unit for measuring the process rate should be selected. The default time unit is hour but others may be selected from the drop down list. The time unit must be the same as the time unit used to measure the pollutant. Clicking on “**OK**” will return you to the tab for the entry of “**Permit/SCC**” information. You will notice that the fields “**Target Parameter**”, “**Process Rate**” and “**Pollutant Unit of Measure**” will have the items that were selected in the emissions factor selection screen. You may provide more detail on the target parameter used to describe the process rate if needed.

Regulations Screen

Test Plan Title: Test Plan Date:

Facility/Tester | Permit/SCC | **Regulations** | Process/APCD | Locations/Methods | Methods cont. | Audit/Calibrations | Schedule | Signatures | Attach.

1. What is the specific purpose for the proposed testing?
 Determine compliance with NSPS and State SIP emissions limitations
 Establish CAM monitoring parameters as stated in Title V permit

2. List all state and federal regulations that apply to the proposed testing:

Reg Desc	Regulation Description	Compound	Limit	Unit
*	Reg Desc Test PTB	Arsenic	0.002	lb/hr
			0	

Record: 1 of 1 | No Filter | Search

3. Will the test results be used for other regulatory purposes (e.g., emission inventories, permit applications, etc.) beyond that stated above? If yes, explain.
 Results will be used for establishing total PM (filterable and condensable) emissions as required by State for Consolidated Emissions Reporting

Figure 19 - Test Plan Regulations Tab

The Regulations screen shown in Figure 19 has three sets of fields describing the purpose for the tests. Input the test purpose and regulations pertaining to the test here.

- **1. What is the ...** List the primary reason(s) for performing the emissions test. If known, list those pollutants that are of primary interest. For example, demonstrate compliance with total filterable PM, SO₂ and NO_x emissions limit stipulated in 40CFR60 Subpart Da and State Rule XX-YY-ZZ. Identify the “**Data Quality Objectives**” (DQO’s) for the test, “**Data Quality Indicators**” (DQI’s) which will be collected, and the criteria which the **DQI’s** will be used to determine whether the test program met the **DQO’s**.
- **2. List all state ... :**
- Click on the “**Add Regulation**” button to open the form shown in Figure 20 for entering a new regulation data. Double click on a previously entered regulation description to edit the contents of an existing entry.

Compound	Regulation	Compound Units	Process Parameter	Process Rate
1,2,3,4,6,7,8-HpCDD	0.0000015	ng/dscm correc		Tons/hr
1,2,3,4,6,7,8-HpCDD	2.5E-08	lb/hr		
1,2,3,4,6,7,8-HpCDF	1.6E-60	ng/dscm correc		
1,2,3,4,7,8,9-HpCDF	1.6E-60	ng/dscm correc		
1,2,3,4,6,7,8-HpCDF	2.5E-08	lb/hr		

Figure 20 – Test Plan Add Regulations

The fields are described as follows:

Regulation Description: The name or description of the regulation. The preferred description of the rule should include the regulatory citation which requires the test for the compound and specifies the identified limit. For example: 40CFR60 Subpart UUU. For clarity and conformation you may also add a generic identifier for the regulatory citation. For example: NSPS for Mineral Calciners and Dryers. If the testing is not performed to demonstrate compliance with an existing regulation, you should provide a general description of the purpose for the test.

Compound: The regulated or targeted compound.

Units: The units of measurement for the compound within the regulation or the desired units used to describe the emissions.

- Process Parameter:** The parameter used within the regulation selected when emissions are expressed as emission per amount of a Process parameter (optional).
- Process Rate:** Automatically filled upon selection of the process parameter (optional, dependent on process parameter).
- **3. Will the test ... :** List the secondary reasons for performing this emissions test. If known, list those pollutants that are of secondary interest. For example, determine emissions of CO, THC, VOC and condensable PM emissions for use in emissions inventory reporting and determination of fees.

Note: Pressing "Shift F2" will expand the currently selected text field to a larger window to allow for easier editing.

Process/APCD Screen

Figure 21 - Test Plan Process/APCD Tab

- **4a. Enter the process data... :** Section 4a is where process data is documented. Process data is quantifiable information on operational parameters for the production unit or controls. Process data includes documentation of parameters that may be used after the test for compliance assurance monitoring, indicators that the facility was operating at representative operating conditions or

indicators of the performance of installed control equipment. It might include fuel feed rate, average steam output, one or more temperatures of the process, scrubber pressure drop, scrubber water flow, ESP current or another measurable parameter. Some process activity information might be used to calculate the emissions limit, for example x pounds of pollutant per ton of clinker. Process information might also be information required in a Title V permit. **Process data is required.** You can either type the information in the fields directly, or click the “**Add Process**” button. If the field is pre-populated and highlighted yellow, which means the ERT completed this field based on the SCC you selected or an activity indicator that you established when you selected the SCC. But if the information in a yellow field is incorrect it can be changed by returning to the area where it was established. For example, if the activity information is not correct, returning to the SCC selection may show that the SCC had multiple default activity parameters and the one selected was incorrect. By changing the selection, the first process data parameter will change to the process units identified in the SCC selection list.

While the first line in process parameters list is populated from the SCC selection list, additional process parameters may be added by clicking on “**Add Process**” the “**Process Information**” menu shown in Figure 22 will appear. This menu is identical to the menu used to populate the SCC activity parameter when no default parameter was established for that SCC.

The screenshot shows the 'Test Plan' application window. At the top, the title is 'Ash Grove Cement 4544' and the date is '2/28/2012'. Below the title bar is a navigation menu with tabs: Facility/Tester, Permit/SCC, Regulations, Process/APCD, Locations/Methods, Methods cont., Audit/Calibrations, Schedule, Reviewers, Attach. The main area displays a table with the following data:

Process Parameter: (double click to view/edit)	Process Rate	Pollutant Unit	Measure
Clinker Produced	Tons/hr	Lb	Tons
Limestone Fed	Tons/hr	Lb	Tons

Below the table is a modal window titled 'Process Information' with the following fields:

- Process Parameter: [Text Field]
- NOTE: The Material and the Action become the Process Parameter (as in "Coal Burned")
- Process Rate: [Text Field]
- NOTE: The Measure and Time Unit become the Process Rate (as in "Tons/hr")
- Pollutant Unit: [Dropdown Menu: Lb]
- Emission factor unit numerator; units associated with pollutant emitted (as in "LB" in "LB of NOx per tons of coal burned")
- Measure: [Dropdown Menu: Tons]
- Time Unit: [Dropdown Menu: /hr]
- Emission factor unit denominator; units associated with material processed (as in "TONS" in "Lb of NOx per TONS of coal burned")
- Will be the same for the Process Rate and Compound Unit
- Material: [Dropdown Menu: COAL]
- Material processed (as in "COAL" in "Lb of NOx per tons of COAL burned")
- Action: [Dropdown Menu: BURNED]
- Action performed on the material (as in "BURNED" in "Lb of NOx per tons of coal BURNED")
- Target Value Range: Target Low: [Text Field: 0] Target High: [Text Field: 0]
- Comments: [Text Field]
- Buttons: Exit, Save and Exit

Figure 22 - Test Plan Process/APCD Add Process Form

To add or change the fields under the different column headings you may click in the specific field to select an existing menu item from the drop down list or you can double click on an existing item in 4a., You will see a box like Figure 22. If the box is not visible, it may be

hidden behind the test plan menu. By clicking on the test plan menu bar and moving it to a different location, you will see the “*Process Information*” menu.

Below is a description of the fields:

Process Parameter:	Process data parameter(s) documented during testing. Entries with a yellow background were pre-populated based on the SCC.
Process Rate:	This is populated with a combination of the units specified in the field for measure and the units specified in time unit.
Pollutant Unit, Measure, Material, Action:	These items are the same as were defined in the section for selecting the SCC.
Target Low:	The lower bound of the process data information. This may be an expected value.
Target High:	The higher bound of the process information. This may be an expected value.
Comments:	Any comments concerning the process data.

Caution: Clicking “*Exit*” will not save your entry. Click “*Save and Exit*” to save.

- **4b. Enter the process lab data... :**

Figure 23 - Test Plan Process/APCD Add Lab Form

Section 4b is where process lab data is entered. List the process materials requiring lab analysis to determine some characteristic of feed, output or byproduct from process. Like section 4a, this is quantifiable information that details what is going on during testing (for example, feed material moisture content or the results of a proximate or ultimate analysis of the fuel, etc). You can directly enter information into the field or click the “*Add Lab*” button to open a form for easy entry, as seen in Figure 23.

The fields are described as follows:

Analysis Required: A description of the lab analysis. This should include any specification describing the specific preparation and analytical

finish rather than a generic term. For example: carbon content by ASTM D 3176 is preferred over carbon content.

Units: Units measured within the analysis.

Comments: Any comments related to the process lab data.

- **5a. Please give a brief description of the source... :**

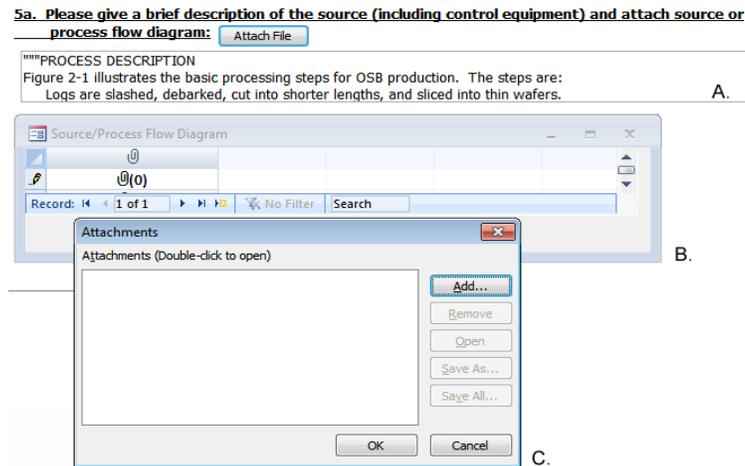

Figure 24 - Test Plan Process/APCD Attach File

Section 5a is where you will give a description of the source, a description of the control equipment, and attach at least one process flow diagram. It is recommended that you provide a brief description in this text area so that the description is available to a reviewer without opening an attachment and is produced in the printed test plan and test report. You should use attachments for complex or more detailed descriptions and diagrams. You may submit multiple attachments.

To attach a file, click on the “**Attach File**” button. Double click on the “**paperclip**” icon to open the “**Attachments**” screen, as seen in Figure 24 C. Click the “**Add**” button to add a file as an attachment.

Once a file has been added as an attachment, click on “**OK**” to return to the “**Source/Process Flow Diagram**” screen. The number of attachments will show to the right of the paperclip.

For more information concerning attachments, see [Chapter 4: Attachments Screen](#).

5b. Control Devices:

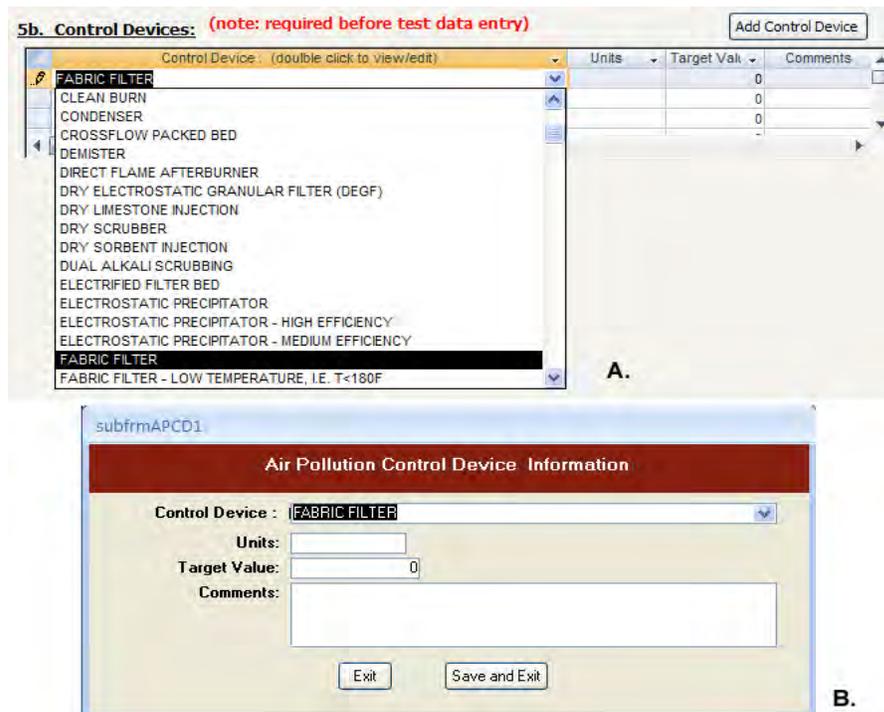

Figure 25 - Test Plan Process/APCD Control Devices Editing and Inserting options

List all emissions control devices in order of process flow. An extensive list of process controls and add on control devices is available using the dropdown list. Choose from dropdown lists. If a control is not on the list, you can type the name of the device directly into the field. You should insure that you list all control devices in section 5a. You should also insure that all parameters required to document the performance of each control device are listed in item 4a.

The other option you have for entering control device information is clicking on the “*Add Control Device*” button. This will open the “*Air Pollution Control Device Information*” screen, as seen in Figure 25 B.

The fields are described as follows:

Control Device: A name or description of the control device as listed in the pull down list.

Units: Units of measure for the most critical operating parameter for the control device.

Target Value: The desired or expected value for the control device operating parameter.

Comments: Any comments pertaining to the control device.

Locations/Methods Screen

The screenshot shows the 'Test Plan' window with the 'Locations/Methods' tab selected. The 'Test Plan Title' is 'Emissions Testing of Wood Chip Dryer 2' and the 'Test Plan Date' is '5/25/2009'. The main section is titled '6. Please enter sampling location information. (all dimensions in inches)' with a note '(note: required before test data entry)'. Below this is a table for location data:

Location	Inlet/Outlet	Total Trave	Ports	Round Duct Diam	Duct Len	Duct Wid
stack	Inlet	16	2	19.5	0	0
	Outlet	16	2	72	0	0

Below the table are instructions: (Note: UpStreamDist = Distance from upstream disturbance, DwnStreamDist = Distance from downstream disturbance). The next section is '7a. Please provide the following information for each test parameter.' with a table:

Location	Target Parameter	Unit	Test Method	Num Test Runs	Test Run Duration
Inlet	Arsenic	22	Method 28	3	64
Inlet	Cadmium	0	Method 29	3	64
stack	Chromium	22	Method 29	3	64
stack	Filterable Particulate	22	Method 5		
Inlet	Filterable Particulate	25	Method 5	1	1

The final section is '7b. Please select the Emissions / Concentrations for each location.' with a table:

Location	Method	Emission/Concentration	Corrected An	Corrected %
Inlet	asafactf	ppm corrected	O2	4
Inlet	asafactf	ppm		0
Inlet	asafactf	mg/m3 case		0
Inlet	asafactf	Dimension BTU using O2		0
Inlet	asafactf	Btu		0

Figure 26 - Test Plan Locations/Methods Tab

Input sampling locations and sampling methods using this screen.

- 6. Please enter sampling location information

The screenshot shows the '6. Please enter sampling location information. (all dimensions in inches)' section with a table for location data:

Equivalent L	Up Stream Distar	Down Stream Dist	Emissions are	Up Stream Pt. Loc. (M1A)	Dwn Stream Pt. L
	240	74	<input type="checkbox"/>	0	0

Below the table are instructions: (Note: UpStreamDist = Distance from upstream disturbance, DwnStreamDist = Distance from downstream disturbance). The main section is titled 'Test Location Information' with a note '(all dimensions are in inches)'. It contains the following fields:

- Location:
- Inlet/Outlet:
- Round Duct Diam.: Assumed Stack O2 %:
- Duct Length: Assumed Moisture %:
- Duct Width: Temp (F):
- Equivalent Diameter: ACFM:
- Up Stream Distance to Disturbance: Non-Particulate Traverse:
- Down Stream Distance to Disturbance:
- Total Traverse Points: Calc. Points:
- Ports: Emissions are Controlled:

For Method 1a:

- Up Stream Pt. Loc. (M1A):
- Dwn Stream Pt. Loc. (M1A):

Buttons:

Figure 27 - Test Plan Locations/Methods Location Edit and Insert options.

Section 6 is where sampling location information is entered. You can either type the information directly into the fields, or click *Add Location*. For a new location, a unique location name must be entered before fields become activated. Multiple sampling locations

may be provided for emissions sources requiring inlet and outlet testing or with multiple emissions locations. The ERT does not currently sum or average emissions from multiple locations. As a result, for sources with multiple inlets or outlet locations testers are required to calculate the sum or average of these multiple stacks and provide the resulting information in the “*Testers Comments*” section.

When you click “*Add Location*”, you’ll see a window like that shown in Figure 27. Enter a unique location name. Then select either inlet or outlet. If a “*Round Duct Diam*” is entered, the “*Duct Length*” and “*Duct Width*” fields will be inactivated. If a “*Duct Length*” value and “*Duct Width*” value are entered, the “*Equivalent Diameter*” will be calculated automatically.

Enter the “*Up Stream Distance to Disturbance*” and “*Down Stream Distance to Disturbance*” and click on the “*Calc Points*” button. The number of “*Total Traverse Points*” required by Method 1 will be automatically calculated. You may change the number in the “*Total Traverse Points*” field to reflect the proposed or actual number of traverse points.

Enter in values for percent oxygen, percent moisture, stack temperature and actual gas flow that you expect to exist during the emissions test in the far right data fields. Select “*Yes*” in the “*NP Traverse*” field if this is a non-particulate (NP) Traverse. Select **no** if this is a Particulate Traverse or a traverse which requires isokinetic sampling. Check the box if a control device is present prior to the test location.

If Method 1a is being used, enter the port location measured in inches for “*Up Stream Pt. Loc. (MIA)*” and “*Down Stream Pt. Loc. (MIA)*”.

The fields are described as follows:

Location:	Enter a unique sampling location name, such as inlet, stack, ESP inlet, scrubber outlet, etc.
Inlet/Outlet:	Inlet or outlet flow direction.
Round Duct Diam.:	Round duct diameter. The diameter of the sampling location, cross-section if round. Use/leave as zero (0) if the location is rectangular.
Duct Length:	Duct length or depth measured in inches. If the sampling location is rectangular, input the length or depth of the duct. Use/leave as zero (0) if the location is circular or round.
Duct Width:	Duct width measured in inches. If the sampling location is rectangular, input the width of the duct. Use/leave as zero (0) if the location is circular or round.
Equivalent Diameter:	Equivalent diameter of a rectangular duct as calculated per Method 1. This value is calculated from the duct dimensions.
Up Stream Distance to Disturbance:	Distance to upstream disturbance.
Down Stream Distance to Disturbance:	Distance to downstream disturbance.
Total Traverse Points:	Total number of sampling or traverse points. This value is calculated.
Ports:	Number of access or sampling ports used for testing.

Assumed Stack O2 %:	Assumed percentage Oxygen (O ₂).
Assumed Moisture %:	Assumed percentage moisture.
Temp (F):	Temperature in degrees F.
ACFM:	Actual cubic feet per minute.
Non Particulate Traverse:	Selection of Yes/No of whether method is a particulate or non-particulate traverse.
Emissions are Controlled:	Controlled device was present.
Up Stream Port Location:	For Method 1a only. Location of disturbance upstream measured in inches.
Down Stream Port Location:	For Method 1a only. Location of disturbance downstream measured in inches.

7a. Please provide the following information for each test parameter

Location	Target Parameter	Lb/Hr Limit	Test Meth	Num Test Runs	Test Run Duration	Comments
Inlet	Arsenic		Method 29	3	64	
Inlet	Cadmium		Method 29	3	64	
stack	Chromium		Method 29	3	64	
stack	Lead		Method 29	3	64	
stack	Manganese		Method 29	3	64	

Figure 28 - Test Plan Locations/Methods Test Parameter.

Figure 28 shows item 7a which presents the test methods, target pollutants and test parameters for each test location. To add test methods and target parameters to a test location, click the “**Add Target Parameters**” button to select a location, method and compound. Once there, you’ll see Figure 29. You can either select a method directly from the drop down list or click “**(select method by compound)**”.

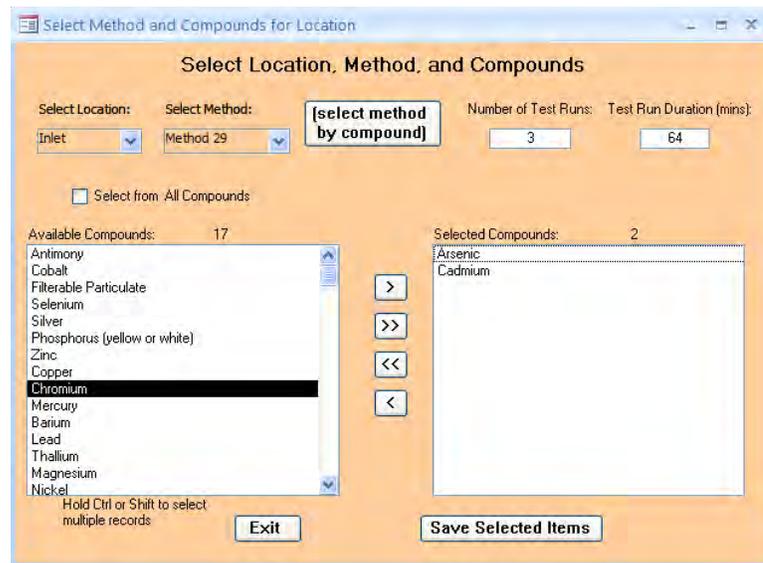

Figure 29 - Test Plan Locations/Methods Select Location, Method, and Compounds screen.

Once the method has been selected “**Available Compounds**” box will automatically populate, as in Figure 29. You must move the compounds you are measuring to the “**Selected Compounds**” window on the right. To do so use the arrow buttons:

- Select one or more of the available compounds or selected compounds. To select multiple compounds, hold the Ctrl key and click other compounds.
- Available or selected compounds are moved using one of the four buttons between the two windows.
 - The “>” arrow shifts the selected compound(s) to the right.
 - The “>>” arrow shifts all the compounds to the right.
 - The “<<” shifts all the compounds listed in the “**Selected Compounds**” box to the left.
 - The “<” shifts only selected compounds to the left.

You must enter the number of test runs and the duration of the test runs. If you have selected one of the Performance Specifications you can enter a “1” into the number of runs and the total duration of the tests in the test run duration. In addition, you must also create a test entry at the same location using the associated method(s) for the performance specification. You should enter the expected total test runs required for the RATA and the individual run durations.

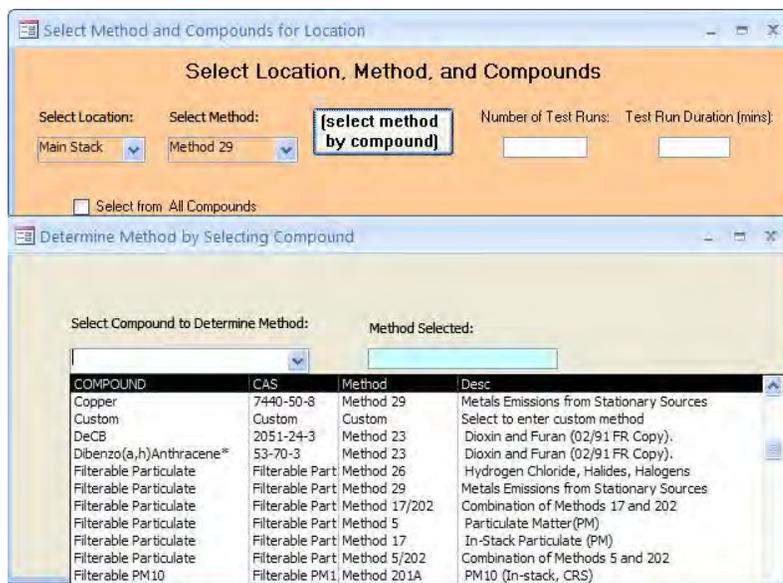

Figure 30 - Selection of method by selection of compound.

Rather than selecting the test method as described above, you may select the method from a list of compounds. By clicking the box “(select method by compound)” a window like the one shown in Figure 30 is available. Scrolling down this list presents in alphabetical order all of the available pollutants, the test methods which may be used to measure these pollutants and a short descriptor of the test method. Selecting the pollutant and test method line will populate the method in the “**Method Selected:**” field. Clicking in the “**Use Selected Method**” block will place the test method in the “**Select Method**” field. You will need to reselect the compound and any additional compounds from the available list as described above.

To complete the addition of a test method for the test location, you must enter the number of test runs which you propose and the proposed duration of the test runs. Clicking on “**Save Selected Items**” will populate the fields in item 7a. Clicking on “**Exit**” will return to item 7a without populating the fields. Once you have returned to item 7a with the populated method and pollutants, you can review, add or edit the fields “**Lb/Hr Limit**”, “**Num Test Runs**”, “**Test Run Duration**” and “**Comments**” without returning to the selection screen. Entering the expected hourly emissions at the established limit or actual emissions will provide additional capabilities in a subsequent “**QA**” portion of the ERT.

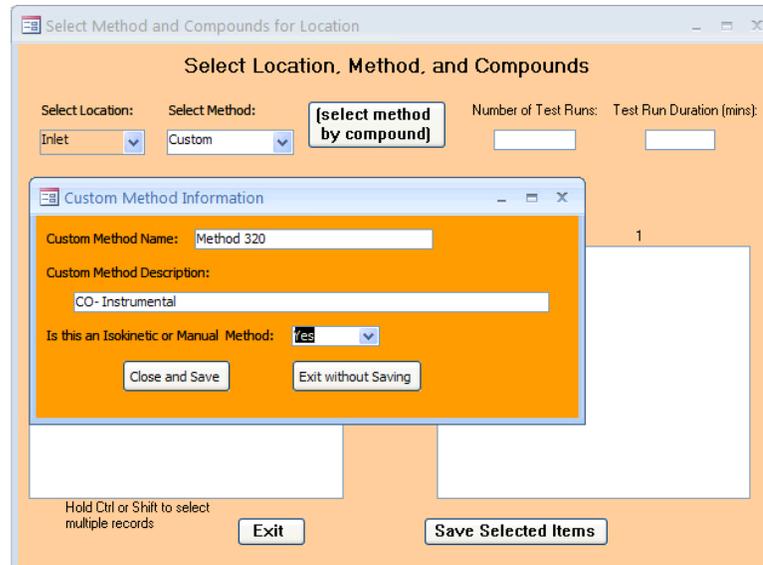

Figure 31 - Test Plan Locations/Methods Custom Method Information screen

If the method you used is not listed in the drop down menu, you may be able to choose “Custom Method.” Advice and tips on using this feature can be found at: http://www.epa.gov/ttn/chief/ert/ertv4/customfeatures_ERT4.pdf. Likewise, if the pollutant you are measuring are not listed, go to the link above for instructions. When you choose a custom method, you must enter a unique “*Custom Method Name*”. The “*Custom Method Description*” is optional. Select “*Yes/No*” to the required question of “*Is this an Isokinetic or Manual Method.*” Click on “*Close and Save*” to save the new method and return to the Parameter form, or “*Exit without Saving*” to return to the “*Parameter*” form without saving changes.

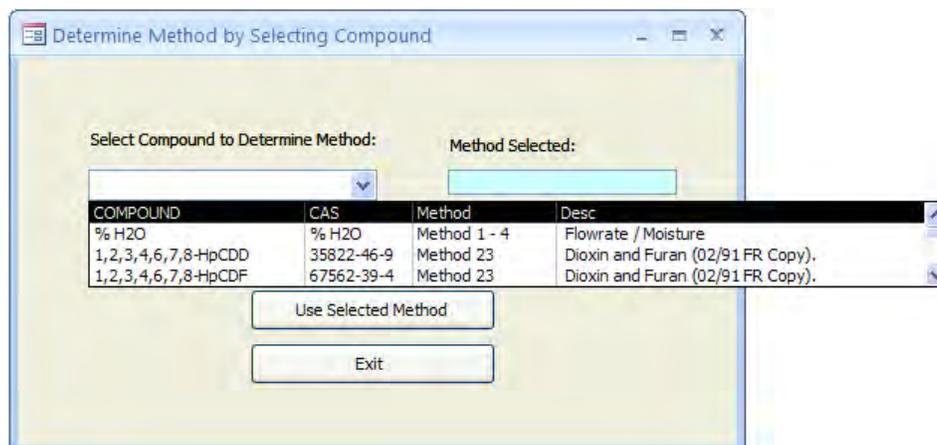

Figure 32 - Test Plan Locations/Methods Test Parameter Insert. Enter by compound.

If you choose custom pollutant, you will be asked to enter the CAS number. The ERT provides a link to the National Institute of Standards and Technologies (NIST) Material Measurement Laboratory (MML) website where you may search for a CAS number and molecular weight. You should enter the CAS number including hyphens, a unique custom

compound name (preferably one of the names listed on the NIST site) and molecular weight. Clicking on “*Close and Save*” will enter the custom pollutant in the “*Selected Compounds:*” column. Clicking on “*Save Selected Items*” will cause the test location, test method and custom pollutant to populate one of the lines in item 7a. While the custom pollutant compound will be saved as one of the test parameters, it will not be saved as one of the available compounds in the “*Select Method and Compounds for Location*” menu. To use this custom compound at another location or with another method, you will have to complete the custom pollutant menu again.

- **7b. Please select the emissions/concentrations for each location:**

Local	Method	Emission/Concentration	Corrected Anal	Corrected %	Process Rate, Parameter
Boiler AE	PST CO to PS4	ppm corrected	O2	3	
Boiler AE	PST CO to PS4	ppm		0	
Boiler AE	PST CO to PS4	lb/million BTU using O2		0	
Boiler AE	PST CO to PS4	lb/hr		0	Million Btus/hr of Heat Input
Boiler AE	PST NOx to PS2	ppm corrected	O2	3	

Figure 33 - Test Plan Locations/Methods Emissions/Concentrations Item

After adding one or more test locations in item 6 and adding the test methods and target analytes in item 7a you can enter the units for reporting the emissions in item 7b (shown in Figure 33). Emissions units which include process information are not available in this area, although the process rate parameter which is used to calculate a process rate based emissions value is identified in this area. Begin by clicking on “*Add Emissions/Concentrations Units*” and the window in Figure 34 will populate.

Select Location - Method:
Stack Exit - Method 1 - 4

Available:	Selected:	Corrected	%
grains/dscf corrected	grains/dscf		0
grams/hr	lb/hr		0
grams/minute	lb/million BTU using O2		0

Hold Ctrl or Shift to select multiple records

Exit Save Selected Items

Figure 34 - Add Emissions/Concentrations Screen

Select a combination of test location and method in the “**Location – Method**,” field which combines values from numbers 6 and 7a above. Be sure to move the units you are using from the “**Available**” box to the “**Selected**” box on the right.

If the selected emission concentration in the “**Available**” box has the word “corrected” on the end of it, two prompts will occur in succession. To the first prompt, “**Enter Corrected Analyte (O₂ or CO₂):**” for the concentration. To the second prompt, “**Enter Corrected Percentage (i.e. 7):**” for the concentration being corrected.

*Note: If a concentration being corrected has been added, the corresponding concentration not being corrected must also be added. If it is not added, an error will show in the “**Emissions**” tab. For example, if “grains/dscf corrected” is selected, “grains/dscf” must first be selected.*

Once you entered all of the information, the only two columns that can be edited directly in the table are “**Corrected Analyte**” and “**Corrected %**.”

The following is a description of the fields:

- Location:** The choices which are available were those location names which were entered in Item 6. If the required location is missing, return to item 6 to add the location name required. This is required and will be used by the ERT during the process of entering test run data.
- Method:** The choices which are available were those test methods which were entered in Item 7a. The field identifies the method used to measure the analyte emissions. This is also required by the ERT and will be used during the process of entering test run data.
- Emission/Concentration:** The emission concentration or mass rate that is being calculated.
- Correcting Diluent:** O₂ or CO₂.
- Correction %:** The percentage of the analyte is corrected.

Methods Continued Screen

Figure 35 - Test Plan Methods cont. Tab

- **8. Describe below or...:** In this section, it is suggested that the promulgation date of any specified test method be identified. Test methods which are not readily available free on the internet should be attached to the ERT for use by people reviewing the test plan or test report. If modifications and/or alternative methods are being proposed or were used, you must attach a document describing the proposed modification to the test plan and a copy of the request **AND** approval (including dates) to the test report. If the modification/alternative method was approved verbally by a regulatory agency, the name and date of the approval should be included. Written formal approval should be attached using the “**Attach File**” button. Test methods that are different from those published in the *Federal Register* should also be attached. Follow the steps in Item 5a to attach a file.
- **9. Does the proposed...:** In this section, answer the question about Method 1 criteria by checking “yes” or “no.” If Method 1 criteria are not met, explain why and document approval, as applicable, To attach a file, click on **Attach File** and follow the steps in Item 5a.
- **10. Has absence of...:** In this section, answer the question about cyclonic flow by checking “yes” or “no.” This field is for the documentation of the absence of cyclonic flow. If the “no” checkbox has been selected, enter documentation of why and approval, as applicable, or attach documentation and approval by clicking on “**Attach File**” and following the steps in Item 5a.
- **11. Select the method...:** If flue gas characterization is for molecular weight purposes only, you may select:

Method 2:

M2- assign 29.0 Mol. Wt:

ambient air, assign a molecular weight of 29.0 (per Method 2).

Method 3:

M3- mol Wt.Orsat or Fyrite:

- molecular weight only, Orsat or Fyrite.
- M3-assign 30.0 Mol. Wt. combustion source:**
combustion source, assign 30.00 for molecular weight.
- M3 – CO₂ or O₂ and Stoichiometric calc:**
using CO₂, O₂ or stoichiometric calculation
- M3A:** Instrumental
- M3B:** Using Orsat emission rate correction factors

Audit/Calibrations Screen

Figure 36 - Audit/Calibration Tab

- **12. Do any of...:** Select “Yes” or “No.”. The test method should indicate whether or not audit samples are required.
- **13. Has all testing...:** It is expected that your response to this question will be “Yes.” If the answer is “No”, please use the text box for the explanation. You can attach calibration documentation in the “Attachments” tab of the ERT.
- **14. Will all calibration...:** If the answer is “No”, use the text box for the explanation. If the answer is not applicable, select “N/A.”
- **15. Is a dilution...:** Select “Yes,” “No” or “N/A.”
- **16. If applicable, list...:** Input information on the calibration gases to be used for any instrumental methods. For the test plan, the information may be incomplete; however, **once the test is completed, this Item MUST be completed accurately since the instrumental test methods data processing uses the “CertValue” in calculating the concentrations.**

Field definitions:

CylID:

For cylinders having more than one calibration gas, input the cylinder once for each gas and include a prefix or suffix with the cylinder ID.

- Compound(Analyte):** Input the gas name.
- Certification Procedure:** Give the certification procedure used.
- Certified Value:** Input the certified value of calibration gas.
- Uncertain Percent:** Input the percent uncertainty of the gas from the certificate.
- CertDate:** Date the calibration gas was certified.
- ExpDate:** Date the certification of calibration expires.

Schedule Screen

Figure 37 - Test Plan Schedule Tab

- **17. What is the proposed test schedule:** This field is primarily to advise the regulatory authority and facility the dates that emissions testing will be performed, including any set up dates.
- **18. Additional comments:** Provide any additional comments about the test.
- **19. Required Personal Protection....:** This field is primarily to advise the regulatory authority of the type of personal protective equipment that will be required for them to use to access the sampling location and any other locations that are associated with the performance of the test program. It also serves to inform the facility of the source tester's knowledge of the required protective equipment they will use during the source test program.

Attachments Screen

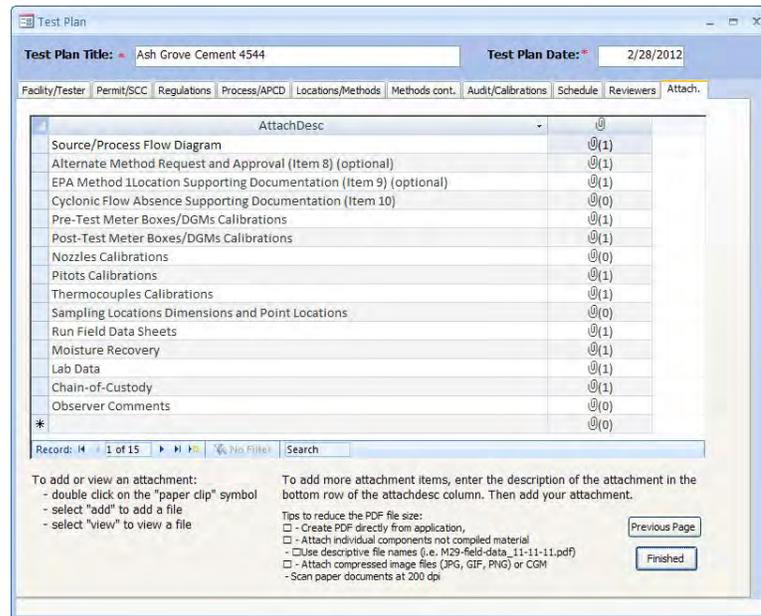

Figure 39 - Test Plan Attachments Tab

Adding an Attachment

Several of the questions in the test plan section allow the user to import files as attachments to the test plan. If you added an attachment in one of the earlier tabs, the attachment tab will show a number “1” (or however many attachments were added) next to the paperclip in parentheses.

To add attachments to an existing named documentation area, double click on the paperclip. A window like that in Figure 40 will open. If files were attached previously, the file name will be listed in the field. If no files were attached, the field will be blank and all but the “Add...” button will be faded. In both situations, to add an attachment, click on the “Add...” button to display a Windows file selection menu.

In this screen you can add additional attachments by double clicking the paperclip next to the description that applies. If your type of attachment isn’t specifically listed, follow these steps:

1. Click the empty lower left hand cell and add a description.
2. Double click the paperclip in the cell to the right of the description.
3. Follow the prompts to add your attachment(s).

These steps can be repeated if you have multiple types of attachments.

(Note: Many of the requested files will be part of the test report and are not required or available at the time the test plan is prepared.)

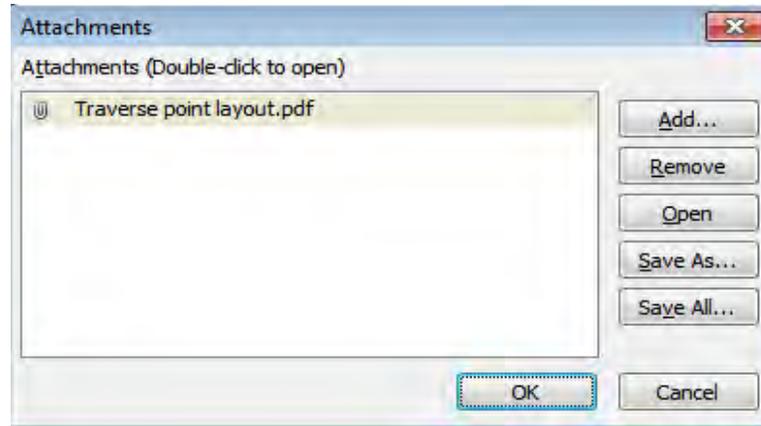

Figure 40 - Test Plan Attachments Options

Other Attachment Options

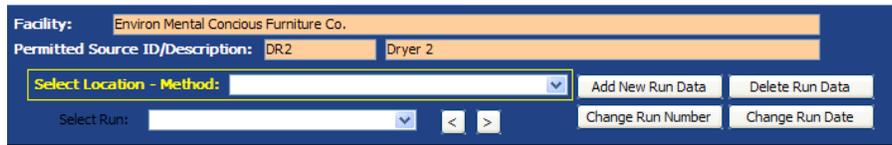

When one or more files are attached to a documentation area, when you double click on the paperclip a window like that in Figure 40 will open. In addition to adding attachments as described above; one can click on one of the file names and then click on “**Open**”, “**Remove**”, “**Save As...**” or “**Save All...**” to open, remove or save the selected attachment(s). Simply follow the prompts.

Click “**OK**” to save the changes and return to the “**Test Plan**” attachment screen. Click “**Cancel**” to return to the “**Test Plan**” attachment screen without saving the changes. The number of attachments will be beside the paper clip image.

Note: If you cannot see the paperclip image, it is likely that the PDS you are using was created by older ERT version. The old PDS files have an OLE object field instead of an attachment file type. As a result; PDS file sizes in ERT version 3 are greater than ERT version 4. In addition, very large attachments may not be able to be viewed because of memory constraints. You should revise the PDS file to the ERT version 4 file type which has with an .accdb extension. If you create a new PDS you will see the paper clips. If the existing PDS is extensive and was created in ERT version 3, you can change the PDS to a version 4 format by: 1) Save all the attachments in the old ERT file using a descriptive file name, 2) Create an new blank PDS using ERT version 4. 3) Close ERT, open MS Access and load the blank PDS, 4) Delete all the tables in the PDS except “tblAttachments”, 5) In the Access menu, select “External Data” then select “Import” “Access”, 6) Use “Browse...” to locate the ERT version 3 PDS, 7) Specify the importing of all tables, queries, forms ...8) Click “OK”, 9) Select the “Select All” button, 10) Deselect “tblAttachments” and click “OK”, 11) Close Access and open the new PDS.

Chapter 5: Test Data

Run Data

The screenshot shows a software interface for managing run data. It features a blue header bar with the following fields and controls:

- Facility:** Environ Mental Concious Furniture Co.
- Permitted Source ID/Description:** DR2 (in a small box) and Dryer 2 (in a larger box)
- Select Location - Method:** A dropdown menu with a blue arrow.
- Select Run:** A dropdown menu with a blue arrow, followed by left and right navigation arrows.
- Buttons:** Add New Run Data, Delete Run Data, Change Run Number, and Change Run Date.

Figure 41 - Run Data Details Screen

The ERT separates methods into two basic categories – isokinetic/manual and instrumental. For an isokinetic/manual method, to complete the “*Test Data*” section you may either import the data from a spreadsheet or manually enter the data. For an instrumental method, you must enter the data manually.

- Click “*Run Data*” in the “*Test Data*” area of the “*ERT- Main Menu*” to bring up the “*Run Data Details*” Screen, as in Figure 41.
- Click on the “*Add New Run Data*” button to add data.

Figure 42 - Import from Spreadsheet Option Dialog

This brings up a spreadsheet option dialog. Click “*Yes*” button to import the data from a spreadsheet (for more information, see [Add New Run Data - Spreadsheet Import](#)). Click the “*No*” button to add data directly into the ERT (for more information, see [Add New Run Data - Directly](#)).

Add New Run Data - Spreadsheet Import

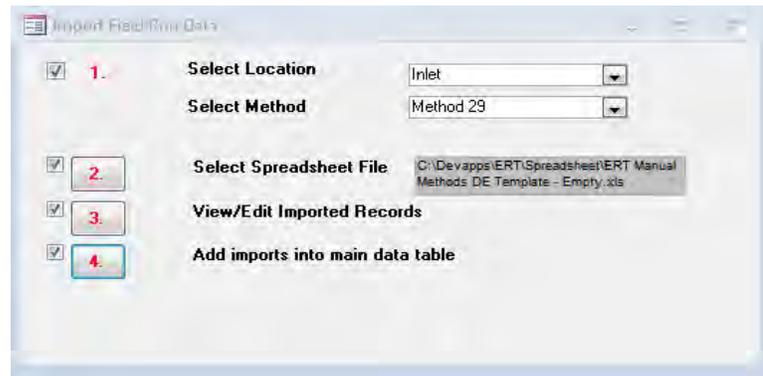

Figure 43 - Import Field Run Data Window

To import the data, it must be entered into the sample field data spreadsheet that was provided with the ERT.

- **Step 1:** Select the *location* and the *method* from the drop down lists, as in Figure 43. A green checkmark will automatically appear in the box to the left of the red number 1 after the selection.
- **Step 2:** Click the # 2 and select the spreadsheet in the browse window, then click “**OK**” or “**Open**” to select the spreadsheet. The file path will appear beside step 2 “**Select Spreadsheet File**”, as shown in Figure 43.

Step 3: Click the # 3 to view the imported data. You will see two tables as in Figure 44. One table is the header data from the spreadsheet and one table is the point data from the spreadsheet.

Review and edit the data in these windows. Click on the “**X**” in the top right corner of each window to close them when you have finished your review.

Figure 44 - View Imported Data Windows

- **Step 4:** Click the # 4 to add the imported data into the main data tables.
- **Step 5** – Click “**OK**” on the data imported successfully dialog and then close the “**Import Field Run Data**” window.

Add New Run Data - Directly
Figure 45 - Enter New Run Key Data Window

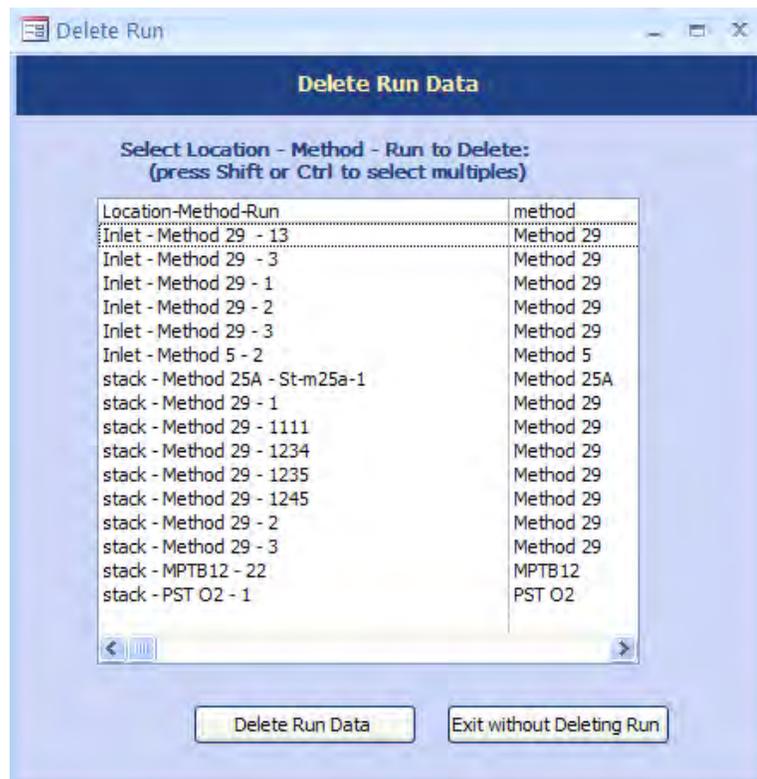

Run data do not have to be imported from spreadsheets. They can be entered directly into the ERT ***Run Data Details*** screens. To do this:

- Click ***Add New Run Data*** from the ***Run Data Details*** window (see **Figure 41 - Run Data Details Screen**).
- Click ***No*** from the import from spreadsheet option dialog (see **Figure 42 - Import from Spreadsheet Option Dialog**). You will be prompted to enter a location – method, run number, and run date for the run data to be inputed.
- Select the ***Location – Method*** from the pick list.
- Enter the ***Run Number***.
- Enter the ***Run Date***.
- Click the ***Add Run Data*** button to save data, or click ***Exit without Adding Run*** to return to Run Data Screen without saving data.
- For isokinetic methods, you must repeat this process until all test runs have been added. For instrumental methods, you can add additional runs up to the number specified in the test plan from the ***ITM Run Results*** tab of the ***Run Data Details*** screen. Adding runs from the ***ITM Run Results*** tab will copy a significant amount of calibration and test setup information to the created runs.

Once the location, method, run number and date have been entered, you must find that run under the drop down list called ***Select Location – Method – Run*** (highlighted in yellow) to enter more information or view that run. See the ***Selecting Locations / Methods / Runs*** section. This will add the key information for the run data to be input. The display will then show either the ***Run Data Details*** screens for an Isokinetic run or an ***Instrumental Method*** run depending on the method selected.

Correcting Run Data Entry Information

Incorrect entry of test data information can be corrected either by deleting the incorrect runs, changing the run numbers associated with one or more runs, or changing the date associated with one or more runs. The following three sections describe the procedures to perform these corrections.

Delete Run Data**Figure 46 - Delete Run Window**

This will delete all of the runs and lab data for the selected run.

- Click the “**Delete Run Data**” button from the “**Run Data Details Screen**”.
- Select the location – method – run from the pick list.
- Click the “**Delete Run Data**” button to permanently delete the data and return to the Run Details screen. Click “**Yes**” on the delete confirmation dialog.
- Click on “**Exit without Deleting Run**” to keep the data and return to the run details screen. You will be prompted to confirm the deletion.

Change Run Number

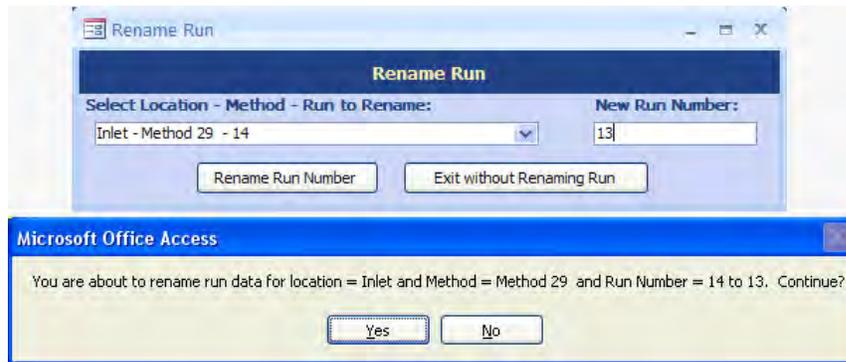

Figure 47 - Rename Run Window with Prompt

This will change the number for the selected run.

- Click the “**Change Run Number**” button from the run data details screen.
- Select the location – method – run from the pick list.
- Enter the new run number.
- Click the “**Rename Run Number**” button. You will be prompted to confirm the renaming. Click “**Yes**” on the rename confirmation dialog to save the new run number, receive confirmation message of the change, and return to the “**Run Data Details Screen**”. Click “**No**” to return to the Change Run Number window.
- Click on the “**Exit without Renaming Run**” to return to the run data details screen without saving changes.

Change Run Date

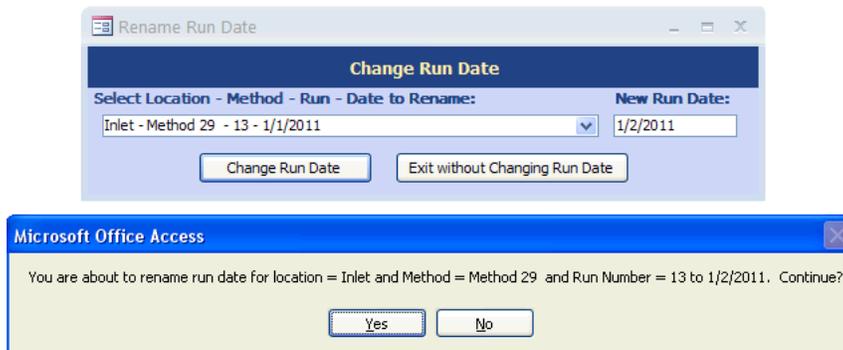

Figure 48 - Change Run Date Window with Prompt

This will change the date for the selected location – method – run - date.

- Click the “**Change Run Date**” button from the run data details screen.
- Select the “**Location – Method – Run – Date**” from the pick list.

- Enter the new run date.
- Click the “**Change Run Date**” button. You will be prompted to confirm the renaming. Click “**Yes**” on the rename confirmation dialog to change the date and return to the Run Data Details Screen. Click “**No**” to return to the run date window without saving.
- Click the “**Exit without Changing Run Date**” to return to the run data details screen without saving changes.

Selecting Locations / Methods / Runs

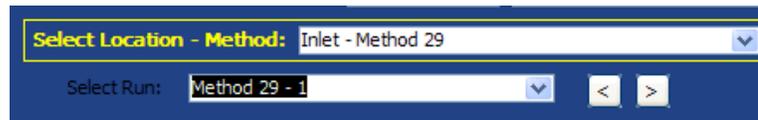

Figure 49 - Select Run Data

This is how you view the data for the different runs when you are on the Run Data Detail screens.

- Select the “**Location – Method – Run**” from the pick list.
- Click on the “<” or “>” button to scroll through runs of selected locations and methods. The “**Method Setup**” tab will be the same for all runs. The effects of scrolling through runs can be seen on the other tabs. Calculations made on 0 value will result in a field with #Error.

Selecting either “<” or “>” will change the run number in the field to the left of the symbols. In addition to changing the run number, changes in the run data details entered into the most of the screens below the run identifier are presented.

Isokinetic/ Measured Method Test Data

The screenshot shows the 'Run Data Details' window. At the top, there are fields for Facility, Permitted Source ID/Description, and a dropdown for Location/Method. Below these are buttons for 'Add New Run Data', 'Delete Run Data', 'Change Run Number', and 'Change Run Date'. A 'Select Run' dropdown is set to 'Method 5 - 111'. The main content area has several tabs: 'Method Setup', 'Header Data', 'Point Data', 'Lab Data', 'Sampling/Stack Data Results', 'Cyclone Cut Size', and 'Emissions'. The 'Method Setup' tab is active, showing a table for 'Compounds for this Location / Method' with columns: Location, Target Parameter, Lb/Hr Limit, Test Method, Num Test Runs, and Test Run Du. Below this is a search bar and an 'Add Target Parameters' button. The second table, 'Emissions / Concentrations for this Location / Method', has columns: Local, Method, Emission/Concentrat, Corrected Anal, Corrected %, and Process Rate, Parameter. It also has a search bar and an 'Add Emissions/Concentrations' button.

Figure 50 - Run Data Details Screen for Isokinetic/Measured Methods

Depending on the method selected, the ERT will display different run data details tabs. For instrumental methods, go to the *Instrumental Method Test Data* section below. For Isokinetic methods, the tabs include:

- “*Method Setup*”
- “*Header Data*”
- “*Point Data*”
- “*Lab Data*”
- “*Sampling/Stack Data Results*”
- “*Cyclone Cut Size*”
- “*Emissions*”

You can import field data information for up to nine isokinetic test runs from a spreadsheet (see [Add New Run Data - Spreadsheet Import](#)) or manually enter the information into the appropriate screens. Importing data from spreadsheets populates only data for the header data tabs and the point data tabs, to produce the emissions calculations users are required to enter the lab data by clicking on the “*Lab Data*” tab.

Method Setup Screen

Run Data Details

Cooler S	Method 5	grains/dscf		0	

Record: 1 of 2 No Filter Search

Add Emissions/Concentrations

Figure 51 - Isokinetic Method: Method Setup Tab

The fields in this section will be pre-populated based on information entered in the test plan. However, they can be modified:

- **“View / Edit Location Information”**: Allows you to revise the test location information supplied during the test plan development. See **Figure 27 - Test Plan Locations/Methods Location Edit and Insert options**.
- **“Add Target Parameters”**: Allows you to add target parameters for this run at this location/method. See **Figure 28 - Test Plan Locations/Methods Test Parameter**. for more information.
- **“Add Emissions/Concentrations”**: Allows you to add emissions/concentrations for this run at this location/method. See **Figure 34 - Add Emissions/Concentrations Screen** for more information.
- **“Delete Target Parameters or Emission/Concentrations”**: Highlight the row of the emission/concentration by clicking on the gray cell to the left of the column named **“Location”** and press the keyboard **“Delete”** button.
- **“Delete Process Rate, Parameter”**: To delete the process rate, parameter you must block all of the text in the field and then press the keyboard **“Delete”** button. It should be noted that the process rate parameter should only be associated with an emission rate and the time units (hr, min, sec) should be the same for both the emissions rate and the process rate.
- **“Change Process Rate Parameter”**: To add or change the process rate parameter, click within the field and then on the down symbol (▼) to reveal the drop down list of available

process parameters. You should choose a process parameter only for emissions rates that have the same time units as the emissions rate.

Header Data Screen

Figure 52 - Isokinetic Method: Header Data

This information is either imported from spreadsheets or is entered directly into the fields. Below is a description of the fields.

Equipment ID: Information provided in the equipment ID area are used to identify the specific piece of equipment used for the test run. Identifiers which may be used include but are not limited to manufacturers' product name and serial numbers or test company identification numbers.

Control Console: Control Console, optional. The control console describes the combination of the dry gas meter, pumps, temperature controllers, manometers, pressure transducers and vacuum gauge. The ID is necessary for calibration documentation purposes.

Umbilical: Sample gas transport line from the sample box to the control console or meterbox (optional). The umbilical usually consists of bundled tubing, thermocouple, electrical lines, etc., used to control the probe and sample box filter temperatures.

StackTC: The ID of the thermocouple device used for monitoring the stack gas temperature. The ID is necessary for calibration documentation purposes.

TedlarBag: The ID of a Tedlar bag, if used. (optional)

OrsatPump: The ID of the pump used for filling a Tedlar bag, for example. (optional)

Nozzle: The nozzle ID. The ID is necessary for calibration documentation purposes.

Probe: Sample probe equipment identification number.

Filters: Information provided in the filters area is used to identify the specific filter used for the test run.

FilterNum1: For particulate sampling, enter the filter's unique identification number.

FilterNum2: The second filter ID, if two filters are used.

FilterNum3: The third filter ID, if three filters are used.

Calibration: Documenting equipment IDs allows for the calibration data for the specific equipment used in sampling to be included with the test data.

Y: The dry gas meter correction coefficient, gamma, of an isokinetic sampling train meterbox (such as used for Method 5 sampling). The value is dimensionless and should be between 0.95 and 1.05.

DH@: The delta H @ ($\Delta H_{@}$) is the orifice pressure differential in inches of H₂O of an isokinetic sampling train meterbox (such as used for Method 5 sampling) that correlates to 0.75 cfm at 528°R and 29.92 in Hg.

Cp: The pitot tube coefficient for a S-type pitot can range from 0.80 to 0.88 but is usually between 0.84 and 0.864. The typical default value used for S-type pitots' which have not been calibrated is 0.85. The Cp for a standard pitot is 0.99.

Dn (in): The nozzle diameter in inches.

Ambient:

Pb: The barometric pressure of the sampling location. If the pressure is reported to sea level conditions, adjust the pressure for the elevation of the location above sea level. A 0.1 inches Hg decrease for every 100 feet of elevation is typically used.

Pstatic: The static pressure, inches of water, of the sampling location.

Temperature: Ambient Temperature in degrees F.

Concentrations:

% CO₂: The carbon dioxide percent of the gas stream tested. The pulldown to the right of the field for the CO₂ concentration provides access to the results of instrumental measurements of CO₂.

% O₂: The oxygen percent of the gas stream tested. The pulldown to the right of the field for the O₂ concentration provides access to the results of instrumental measurements of O₂.

Checks: The following parameters refer to leak checking of various equipment components. “Pre” refers to checks done before the start of a run, “mid” is in reference to checks performed sometime during the run (such as between port changes), and “post” means after the run.

- Vacuum, Pre & Post:*** The vacuum at which the pre and post sampling train leak checks were performed.
- Leak Check Total Volume, Mid:*** This is the total volume recorded by the dry gas meter (DGM) during all leak checks performed between the pre test and post test leak checks. This volume is subtracted from the total sample volume recorded for the test run. These leak checks are typically conducted during sampling port changes.
- Leak Rate, Pre & Post:*** The pre and post test sampling train leak check rates. For Method 5, the post-test leak rate must be less than or equal to 0.02 acfm.
- Pitot, Pre, Mid, & Post:*** The pre, mid, and post-test leak check results, as applicable.
- Nozzle, Pre, Mid, & Post:*** Nozzle inspections for dents, nicks, etc.
- Stack TC, Pre, Mid, & Post:*** The pre, mid, and post-test results of the thermocouple check, as applicable.

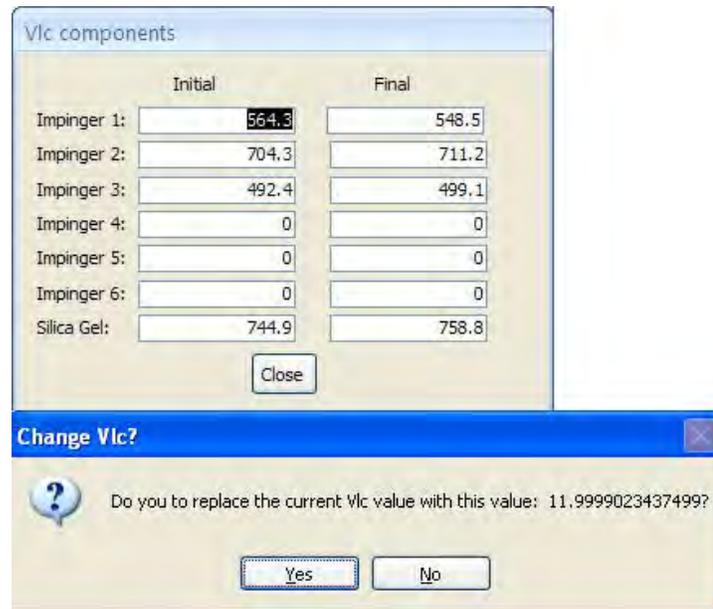

Figure 53 - Volume of liquid collected sub menu.

Vlc Components:

Vlc: Vlc is the volume of liquid condensate. The Vlc is the volume or mass of water condensed from the sample gas and collected in the impingers of an isokinetic sampling train. Click on "**Vlc Components**" button to open a form to enter Vlc Components. Enter the values for the initial volume or mass and final volume or mass for up to 6 Impingers and the silica gel. When complete, click on "**Close**". A prompt will appear with the new calculated Vlc value to verify that the current Vlc value should be replaced with the new Vlc value. Click "**Yes**" to replace current value. Click "**No**" to close without replacing the current Vlc value. Figure 53 shows the Vlc form and acceptance prompt. If you selected "**Yes**" to the prompt the Vlc value will populate the Vlc data field in the header date tab.

Micromanometer ID: Identification number of micromanometer.

Sensitivity: Units of inches of water column.

Defaults:

Tstd: Standard temperature which defaults to EPA standard of 68 degrees F. When the test method performed requires the use of a different standard temperature, the "68" in this field should be changed to the temperature specified.

Pstd: Standard pressure which defaults to EPA standard of 29.92 inches of mercury. When the test method performed requires the use of a different standard pressure, the "29.92" in this field should be changed to the pressure specified.

% CO: Carbon monoxide percentage which defaults to zero (0).

Fuel Type: The selection of the fuel type with this drop down menu populates the three F-factor fields below this selection with the values presented in Table 19-2 of EPA Method 19. In addition, "**Override**" may be selected and fuel specific F-factors as calculated by equations 19-13, 19-14 and 19-15 in EPA Method 19 may be entered in the appropriate F-factor field. The values entered are based upon an ultimate analysis of the fuel or combination of fuels using equations 19-16, 19-17 and 19-18 of EPA Method 19.

Fd: The value Fd is the ratio of the quantity of dry effluent gas generated by combustion to the gross calorific value of the fuel. When combined with the oxygen concentration, the emission rate in lb/MMBtu can be calculated from the dry pollutant emissions concentration. By selecting the fuel type, the F-factor, Fd, from USEPA Reference Method 19 is populated in this field. If override is selected, the user should enter the Fd as calculated by equation 19-13 or 19-16 of USEPA Reference Method 19.

Fw: The value Fw is the ratio of the quantity of wet effluent gas generated by combustion to the gross calorific value of the fuel. When combined with the wet oxygen concentration and the

moisture concentration, the emission rate in lb/MMBtu can be calculated from the wet emissions concentration. By selecting the fuel type, the F-factor, F_w, from USEPA Reference Method 19 is populated in this field. If override is selected, the user should enter the F_w as calculated by equation 19-14 or 19-17 of USEPA Reference Method 19.

F_c:

The value F_c is the ratio of the theoretical carbon dioxide produced during combustion to the higher heating value of the fuel combusted. When combined with the carbon dioxide, the emission rate in lb/MMBtu can be calculated from either the wet or dry emissions concentration. By selecting the fuel type, the F-factor, F_c, from USEPA Reference Method 19 is populated in this field. If override is selected, the user should enter the F_c as calculated by Equation 19-15 or 19-18 of USEPA Reference Method 19.

Figure 54 - Isokinetic Method: Point Data Tab

The point data is imported from the spreadsheet or is manually entered here. Use the side and bottom scroll bars to view more information. Recall at any time you can change the width of the columns in Access by placing the cursor over the split between the columns and clicking and dragging the column to the desired width.

Below is a description of the fields:

Point:

The sampling point label, such as A1, A-1, D-2, etc.

BeginTime:

The cumulative sampling time that sampling at the sample point was started, in minutes. Port changes DO NOT reset the time to zero (0).

EndTime:	The cumulative sampling time that sampling at the sample point was ended, and is the begin time plus the sampling time per point. Values in end time are used in calculating Net Run Time and isokinetics.
Clock:	The actual clock time at the start of sampling at a point.
GasMeter:	The dry gas meter volume reading at the <i>beginning</i> of the sampling at a point. This means that the final volume reading is recorded in a row without a point label and no other recorded point data. Sometimes the sampling data is recorded at the end of sampling at a point which would require that the first volume reading is recorded without any other sampling data. Values in Gas Meter are used in the calculation of sample volume metered, standard sample volume metered, isokinetics, calculated moisture content of sampled gas stream, dry mole fraction of water, wet molecular weight of gas stream, velocity of gas stream, and actual and standard stack gas flow.
DeltaP:	The velocity pressure (delta p) expressed in inches of water. Values in Delta P are used in the calculation of isokinetics, average delta P, velocity of gas stream and actual and standard stack gas flow.
OrificePresDesired:	Orifice pressure setting required for sampling isokinetically, inches water.
OrificePresActual:	Orifice pressure actually sampled or reached, inches water. The values in the Orifice Pressure Actual are used in the calculation for Delta H, sample volume corrected to standard conditions, isokinetics, moisture percentage, dry mole fraction of water, velocity of gas stream and actual and standard stack gas flow.
StackTemp:	Stack temperature is the temperature of the effluent gas at the sampling point and is expressed as degrees F. The values in the stack temp are used in the calculation for isokinetics, moisture percentage at saturation, dry mole fraction of water, wet molecular weight of sampled gas stream, average stack temperature, velocity of gas stream, and actual and standard stack gas flow.
ProbeTemp:	Temperature of the sampling probe, degrees F.
FilTempIn:	Filter temperature entering the filter box or compartment, degrees F. All filter temperatures should be the temperature measured by a thermocouple in direct contact with the sample gas. Where a sampling protocol requires the monitoring of two filter temperatures, this may be used as the exit gas temperature for the first filter. For example, this would be the Method 5 filter temperature for a combined Method 5 and Method 202 sampling train.
FilTempOut:	Filter temperature exiting the filter box or compartment, degrees F. Where a sampling protocol requires the monitoring of two filter temperatures, this may be used as the exit gas temperature for the second filter. For example, this would be the Method 202 filter temperature for a combined Method 5 and Method 202 sampling train.
FinalExitTemp:	Temperature of sample gas exiting silica gel impinger, degrees F.
DryGasInlet:	Dry gas meter inlet gas temperature, expressed as degrees F.
DryGasOutlet:	Dry gas meter outlet gas temperature, expressed as degrees F. The values in the dry gas outlet are used in the calculation for dry gas meter temperature, sample volume corrected to standard conditions, isokinetics, moisture

percentage of stack gas, dry mole fraction of water, wet molecular weight of sampled gas stream, average stack temperature, velocity of gas stream and actual and standard stack gas flow.

PumpVac: Vacuum of the sampling pump, inches mercury.

SampleRate: Sampling rate, cubic ft per min.

Notes: Observations or comments.

Lab Data Screen

Compound	Mass	Units	Flag	Comments
Zinc	20	mg		
Silver	23	mg		
Nickel	23	mg		
Manganese	23	mg		
Lead	23	mg		
Chromium	23	mg		

Figure 55 - Isokinetic Method: Lab Data Tab

Enter the lab data for each compound. Below is a description of the fields:

Compound: Analyte name from Setup window.

Mass: Catch weight reported from lab.

Units: The mass units from: gm (grams), mg (milligrams), ug (micrograms), ng (nanograms) or pg (picograms).

Flag: Lab quantifier comment about sample data. May be ND, EMPC, J, etc. EMC Guidance document GD-051F recommends using the following flags for stack test results which have multiple reported fractions: BDL (below detection level) – all analytical values used to calculate and report an in-stack emissions value are less than the laboratory's reported detection level(s); DLL (detection level limited) – at least one but not all values used to calculate and report an in-stack emissions value are less than the laboratory's reported detection level(s); and ADL (above

detection level) - all analytical values used to calculate and report an in-stack emissions value are greater than the laboratory's reported detection level(s).

Comments:

Observations or comments. EMC Guidance document GD-051F recommends the reporting of individual components and laboratory detection level(s) in the comment field. Each component should be provided in the order of the sampling train with commas separating the individual values. Values which are below the detection limit should be enclosed with brackets and the value preceded with a less than sign. For example, a four fraction sample would be reported as 0.036, [<0.069], 1.239, [<0.945]. It is suggested that the method to address below detection level results should be included in the comment field as well as a summary of the methodology used to establish the detection level.

Sampling/Stack Data Results Screen

Figure 56 - Isokinetic Method: Data Results Tab

This tab shows results for a specific run, which were calculated from data entered into the previously. None of the fields are editable.

By placing your mouse over either the abbreviations or the data fields and pausing for about two seconds, a popup tip will appear explaining the abbreviations. This feature is not used for either “*Net Run Time*” or “*Net Traverse Points*” as these are easily deciphered.

Click the “*View All Runs*” button to display a print-ready window showing the results from all runs in a side-by-side manner.

Below is a description of the fields:

NetRunTime:	Net time in minutes of run.
NetTravPts:	Net number of traverse points.
Dn:	Diameter of nozzle, inches.
Cp:	Pitot coefficient.
Y:	Meter box coefficient, Gamma.
Pb:	The barometric pressure of the sampling location.
DeltaH:	DGM orifice pressure differential, water inches.
Vm:	Sample Volume metered, actual cubic feet.
Tm:	Dry gas meter temperature, degrees F.
Vmstd:	Sample volume corrected to standard conditions, DSCF.
Vlc:	Equivalent volume of liquid water collected in moisture sample, ml.
Vwstd:	Volume of water collected at standard conditions, SCF.
%I:	Percent Isokinetic, percentage.
% H2O:	Calculated moisture content of sampled gas stream, percentage.
% H2Osat:	Calculated moisture content of saturated gas stream, percentage.
Mfd:	Dry mole fraction, 1-BWS.
% CO2:	Carbon Dioxide concentration of sampled gas stream, percentage.
% O2:	Oxygen concentration of sampled gas stream, percentage.
% CO + N2:	Balanced gas concentration of sampled gas stream, percentage.
Fo:	Ratio of excess oxygen and carbon dioxide. Calculation uses $(20.9 - \%O_2)/\%CO_2$.
Md:	Dry molecular weight of sampled gas stream, lbs/lb-mole.
Ms:	Wet molecular weight of sampled gas stream, lbs/lb-mole.
Pg:	Static pressure of sampled gas, water inches.
Ps:	Absolute pressure of sampled gas, inches of Hg.
Ts:	Temperature of sampled gas, degrees F.
DeltaPavg:	Average pitot tube differential pressure, water inches.
Vs:	Velocity of gas stream, feet per second.
Dstk:	Diameter of exhaust, feet.
Dwdth:	Width of exhaust, feet.
Dlngth:	Length of exhaust, feet.
As:	Area of stack, feet squared.

Qsd: Dry volumetric flow rate of exhaust at standard conditions, DSCFM.

Qaw: Actual volumetric flow rate of exhaust, ACFM.

MMBtu/Hr: Heat Rate, mmBtu per hour.

NOTE: Fields with “#Error” is a result of missing or incomplete Run data. See the descriptions for the point data columns to identify data entry errors that may cause one or more field in the sampling results tab to display “#Error.” Errors in the sampling results may also be due to errors in one of the fields in “Calibration,” “Concentration,” or volume of liquid components (Vlc).

Cyclone Cut Size Screen

Run Data Details

Permitted Source ID/Description: DR2 Dryer 2

Select Location - Method: stack - Method 29

Select Run: Method 29 - 2

Method Setup | Header Data | Point Data | Lab Data | Sampling/Stack Data Results | Cyclone Cut Size | Emissions

Note: These results are only valid for Methods using PM10 and PM2.5 Cyclone Head!

Method:	RunNumber:	RunDate:
Method 29	2	12/23/2004

PM10-2.5 Results Calculations

u:	Stack Gas Viscosity	173.3
Qe:	Flow Rate at Cyclone Conditions, ACFM	0.893
Qerd:	Sampling Rate at Standard Conditions, DSCFM	0.519
Nre:	Reynolds Number	5509
C:	Cunningham Correction Factor	1.130
D50_PM10:	Cut Diameter of PM10 Cyclone I, Micrometers	6.25
D50_PM2.5:	Cut Diameter of PM2.5 Cyclone IV, Micrometers	1.21

Figure 57 - Isokinetic Method: Cyclone Cut Size Tab

These results are calculated for every isokinetic method. However, they are only intended for methods using PM10 and PM2.5 cyclone heads. Click on the value to expand the value to twelve positions to the right of the decimal.

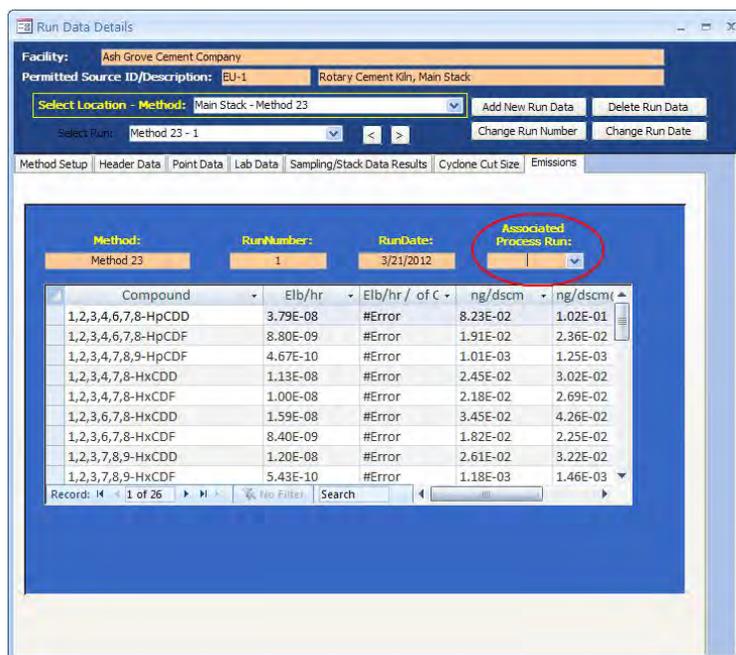

Emissions Screen

Figure 58 - Isokinetic Method: Emission Results Tab

This tab shows the calculated emissions/concentrations for each compound by run. Generally, these fields are not editable. Columns other than “*Compound*” are dependent on the “*Emissions / Concentrations*” selected in the “*Methods Setup*” tab. If a process rate variable has been associated with an emission rate, there will be an additional column which presents the process based emissions calculation. You will see the text “#Error” in this column until the test run has an associated process rate selected. To calculate the process based emissions select the process run using the drop down menu in the far right salmon colored field below the text “*Associated Process Run*” which is circled in Figure 58. The “#Error” will be replaced by the quotient of the test run emission rate divided by the process rate for the selected process run.

Below is a description of a few of the more common column headings:

- Compound:*** Analyte name from setup window.
- Gr/dscf:*** Grain per dry standard cubic feet.
- Gr/dscf@7%O2:*** Grain per dry standard cubic feet corrected to 7% O₂.
- Elb/hr:*** Pounds per hour.
- Elb/hr/Tons of ...:*** Pounds per Ton of ... The full text of the divisor (Tons of ...) is dependent on the choice of process variable selected under the “*Process Rate Parameter*” heading of the “*Emissions / Concentration*” area of the “*Method Setup*” tab.

Instrumental Method Test Data

Figure 59 - Run Data Details Screen for Instrumental Methods

16. If applicable, list the expected calibration gas concentrations for all proposed instrumental test methods. Include as much information as is known at this time.

CylID	Compound(Analyt)	CertProcedure	CertValk	UncertainPerce	CertDate	ExpDate
N2Z	N2Z	NA	0	0	1/11/2012	1/11/2012
NOxH-SA12283	NOx - SA 12283	1997 EPA Traceab	51.3	1	9/15/2010	9/15/2012
NOxM-SA 12283	NOx - SA 12283	1997 EPA Traceab	25	1	9/15/2010	9/15/2012
O2H-CC243836	O2 - CC243836	1997 EPA Traceab	19.9	1	3/23/2011	3/23/2014

Figure 60 - Calibration gas cylinder identification and information.

- You must enter the instrumental method test data manually. Begin by returning to the “*Audit/Calibrations*” tab in the “*Setup / Test Plan*” area. Update or input the calibration gases certified cylinders information in Item 16, as shown in [Figure 36 - Audit/Calibration Tab](#). When you update or input the calibration gas cylinder information, you must enter a unique name in the “*CylID*” column for each gas that was used in the emissions test. For cylinders which contain multiple calibration gases, you can make the cylinder identification number unique with the addition of the compound and range indicator (as an example see the names used under “*CylID*” in Figure 60). Once unique cylinder identification is provided in the “*CylID*” column, you should insure that the remainders of the columns contain the correct information as is documented by the certificate provided by the cylinder supplier.
- In addition, you must enter all the instrumental test method data required for any Performance Specifications prior to entering the CEM data associated with the reference method test runs.

Once you have performed the audit calibration update, the procedure is similar to inputting isokinetic data with the exception that the tabs in the “*Run Data Details*” screen for Instrumental Methods differ from those of the isokinetic methods screen. These tabs include: “*Method Setup*”, “*Calibrations*”, “*ITM Run Results*”, and “*Emissions*”. While the information in the “*Method Setup*” and “*Emissions*” are identical to the isokinetic methods screens, the differences in the test methods require different information than isokinetic test methods.

To minimize data entry time and reduce data entry errors, it is suggested that the first run be completed prior to adding subsequent test runs. The ERT uses information in the completed test run to pre populate the next test run. For example, all information in the “*Calibrations*” tab are retained and selected information in the “*ITM Run Results*” tab are transferred to the appropriate field for the next run. Users can revise these pre populated fields if needed. In addition, to minimize warning messages, users should enter the specific required information suggested in the below instructions before entering the majority of the remaining information.

Method Setup Tab

Figure 61 - Instrumental Method: Method Setup Tab

As is the case with the method setup screen for the isokinetic methods, the majority of the fields in this section will be pre-populated based on information entered in the test plan. However, they can be modified without returning to the test plan by using the following:

- **View / Edit Location Information:** Allows you to revise the test location information supplied during the test plan development. See [Figure 27 - Test Plan Locations/Methods Location Edit and Insert options](#).
- **Add Target Parameters:** Allows you to add target parameters for this run at this location/method. See [Figure 29 - Test Plan Locations/Methods Select Location, Method, and Compounds screen](#). for more information.

- **Add Emissions/Concentrations:** Allows you to add emissions/concentrations for this run at this location/method. See [Figure 34 - Add Emissions/Concentrations Screen](#) for more information.
- **Delete Target Parameters or Emission/Concentrations:** Highlight the row of the emission/concentration by clicking on the gray cell to the left of the column named location and press the keyboard “Delete” button.
- **Delete Process Rate, Parameter:** To delete the process rate, parameter you must block all of the text in the field and then press the keyboard “Delete” button. It should be noted that the process rate parameter should only be associated with an emission rate and the time units (hr, min, sec) should be the same for both the emissions rate and the process rate.
- **Change Process Rate Parameter:** To add or change the process rate parameter, click within the field and then on the down symbol (▾) to reveal the drop down list of available process parameters. You should choose a process parameter only for emissions rates and which have time units the same as the emissions rate.

	High	NOx-CC2555	156.6	465	66.32	1/24/2005	5/18/2008
System	Zero	CO2-CC-81020	5.08	0.1	-11.12	5/26/2006	5/26/2009
	Upscale	NOx-XCO3034	414	258.1	55.51	3/29/2006	3/29/2008

Calibration Set	Gas Label	Cylinder ID	Cert. Value	Response	Error %	Certification	Date Of Expiration
Direct	Zero			0			
Span	Low			0			
	Mid			0			
	High			0			
System	Zero			0			
	Upscale			0			

Figure 62 - Instrumental Method: Calibrations Tab

The results of the instrument calibration and system zero and span responses must be entered in the *calibrations* tab prior to data entry in the *ITM Results* tab. In addition, you should enter the *set* number and the *span* value for before you select any calibration cylinders under *Cylinder ID*. After entering a *set* number and *span* value, select the *Cylinder ID* from the pick list. For each selected *Cylinder ID*, the orange fields will be automatically filled using information that was entered in the “Audit/Calibrations” tab of the “Test Plan”. You will note that when you select the “*Cylinder ID*”, the ERT will display an

error percent in the yellow fields. Initially this value is based upon calculations using the certification value and a response of zero. When you enter the actual response for the “**Direct and System Calibrations**” you will note that the calculated error percent changes.

NOTE: Be sure to input the span value before inputting the responses; otherwise a non-fatal error message is generated (which may be ignored).

Below is a description of the columns:

Calibration Set:	The number used to associate this set of calibrations with the run data entered in <i>the ITM Run Results</i> tab.
Calibration Mode:	Direct or System.
Span:	Span concentration used to calculate percent bias and percent drift. Generally, the span value is set at the concentration of the high level calibration gas although the value is dependent on the method being used.
Gas Label:	Direct Mode includes Zero, Low, Mid and High. System mode includes zero and upscale. Calibration level of measurement range.
Cylinder ID:	Cylinder identification number on the gas cylinder and any additional label to make this identifier unique for the gas and concentration. This field is populated by the selection of one of the available ID's entered in the test plan section of the ERT.
Cert. Value:	Calibration gas certified concentration. This field is automatically populated from the information entered in the test plan section of the ERT.
Response:	The analyzer's response to gas injection. This is the value measured by the instrument when challenged with gas from the gas cylinder identified in the Cylinder ID column.
Error %:	Difference between certified value and analyzer measurement. Specific calculation procedures are dependent on the reference method being performed.
Date of Certification:	Date cylinder received certification for use. This field is automatically populated from the information entered in the test plan section of the ERT.
Date of Expiration:	Date cylinder certification expires. This field is automatically populated from the information entered in the test plan section of the ERT.

Add New Run

Figure 63 - Instrumental Method: ITM Run Results Tab

Enter the results from the test run: If you followed the guidance presented in the first section of “*Instrumental Test Method Data*”, only one blank run was created. By completing the information in the “*ITM Run Results*” for one run and adding new runs with the menu button on this page, much of the information on this page will be pre populated on the pages of the new runs. If “*ITM Run Results*” have been completed on some but not all runs or if the number of runs entered is equal or greater than specified in the test plan, the “*Add New Run*” button will be available on only the last run. If the “*Add New Run*” button is not visible, new runs can be added using the “*Add New Run Data*” button near the top of the screen.

To complete the information on the “*ITM Run Results*” tab, it is suggested that the units for *Cavg* be selected before selecting the calibration set or entering any system response information. If you start entering data in the “*Start Time*” field, you can use the *tab* key to progress through all data entry fields without using the mouse to change fields. If flow rate, moisture percent, *CO₂* concentration or *O₂* concentration have been documented in the ERT by other tests, you can select the test and run ID using the drop down menu to populate these fields. You should associate the test run data with the calibration gas set by selecting the set from the *Set* pick list. Figure 64 shows the use of both the selection of other stack test results for populating the stack parameter information and the use of the set pick list for associating calibration sets with the test run. Enter the zero and upscale system responses for the pre and post test calibrations. Then record the test run average concentration value measured by the instrument in *Cavg*. The value in *Cgas* will be calculated. If the source is a combustion unit you can select the fuel type and the F-factors for that fuel will be populated in the orange field below the Fuel Type Selection field. If the Fuel Type “*Override*” is selected, you can enter fuel specific F-factors based upon an analysis of the combusted fuel.

Figure 64 - ITM Run Results, stack parameter and calibration set selection.

If additional test runs are required and the “**Add New Run**” button is visible within the green “**ITM Run Results**” screen, you can add the next run by clicking on this button. The screen then updates with the next numbered run pre populated in the **run** field. The run date field will have the same run date. In addition, the “**ANALYZER**” fields, the “**OPERATING PARAMETER**” fields, the pre test calibrations and the fuel type fields will be pre populated with information from the previous run. The start time, end time, flow rate, moisture, CO₂, O₂, Post test calibrations and **Cavg** will be empty. In addition to entering data into the empty fields, you can revise any pre populated fields or change the calibration set.

If you select a run Id associated with the test you are viewing, or a Run Id from another test, the run Id will be automatically filled. If the Id is not associated, an alert box stating “**Data type mismatch in criteria expression**” will appear and the system will not record the run results. If this happens, close the “**Run Data Details**” screen and click on the “**Data Details**” tab’s “**Run Data**”. Select the “**Location – Method**” and begin again.

You can click on “**Delete Run Data**” on “**Run Data Details**” screen to remove erroneous run data.

Field descriptions are below:

Run:	Prefilled, but editable, number of run.
Run Date:	Date run was performed.
Start Time:	Hour-minute-second AM/PM that run was performed. Time can be entered as 24 hour time or 12 hour time with the AM/PM extension and the time will revert to the latter time format.
End Time:	Hour-minute-second AM/PM that run was completed. Time can be entered as 24 hour time or 12 hour time with the AM/MP extension and the time will revert to the latter time format.
Flow Rate, SCFM:	The standard cubic feet per minute volumetric flow rate.
Moisture, %:	Percentage moisture in gas.
CO₂, %:	Percentage carbon dioxide, CO ₂ .
O₂, %:	Percentage oxygen, O ₂ .
Fo:	Ratio of excess Oxygen and Carbon Dioxide. Calculation uses $(20.9 - \%O_2)/\%CO_2$.
Analyzer:	
Make:	Analyzer Make.
Model:	Analyzer model number.
S/N:	Serial Number of Analyzer.
Operating Parameters:	
Operating Range:	The acceptable range of fluctuations of concentrations of analyte being measured.
Units (% , ppm, ppb);	The units used for the operating range.
No. Readings /Avg:	Number of readings or average number of readings.
Time Interval of Avg:	Time interval between readings.
Fuel Type:	The selection of the fuel type with this drop down menu populates the three F-factor fields below this selection with the values presented in Table 19-2 of EPA Method 19. In addition, “ Override ” may be selected and fuel specific F-factors as calculated by equations 19-13, 19-14 and 19-15 in EPA Method 19 may be entered in the appropriate F-factor. The values entered are those calculated based upon an ultimate analysis of the fuel or combination of fuels using Equations 19-16, 19-17 and 19-18 of EPA Method 19.
Fd:	The value Fd is the ratio of the quantity of dry effluent gas generated by combustion to the gross calorific value of the fuel. When combined with the oxygen concentration, the emission rate in lb/MMBtu can be calculated from the dry pollutant

	<p>emissions concentration. By selecting the fuel type, the F-factor, F_d, from USEPA Reference Method 19 is populated in this field. If “Override” is selected, the user should enter the F_d as calculated by Equation 19-13 or 19-16 of USEPA Reference Method 19.</p>
F_w:	<p>The value F_w is the ratio of the quantity of wet effluent gas generated by combustion to the gross calorific value of the fuel. When combined with the wet oxygen concentration and the moisture concentration, the emission rate in lb/MMBtu can be calculated from the wet emissions concentration. By selecting the fuel type, the F-factor, F_w, from USEPA Reference Method 19 is populated in this field. If “Override” is selected, the user should enter the F_w as calculated by Equation 19-14 or 19-17 of USEPA Reference Method 19.</p>
F_c:	<p>The value F_c is the ratio of the theoretical carbon dioxide produced during combustion to the higher heating value of the fuel combusted. When combined with the carbon dioxide, the emission rate in lb/MMBtu can be calculated from either the wet or dry emissions concentration. By selecting the fuel type, the F-factor, F_c, from USEPA Reference Method 19 is populated in this field. If “Override” is selected, the user should enter the F_c as calculated by Equation 19-15 or 19-18 of USEPA Reference Method 19.</p>
Calibration Set:	<p>The number assigned to the set of readings. The number used to associate this data to the data entered in Calibrations tab.</p>
Calibration Mode:	<p>Pre (before) and post (after) readings.</p>
Gas Label:	<p>Calibration level of measurement range, assigned as zero or upscale.</p>
Cylinder ID:	<p>Cylinder identification number on the gas cylinder and label.</p>
Cert. Value:	<p>Prefilled calibration gas certified concentration.</p>
Instrument Response:	<p>The manufactured listing of the proper instrument response settings.</p>
System Bias %:	<p>Calculated percentage of bias.</p>
Drift %:	<p>Calculated percentage of drift.</p>
Cavg:	<p>Average gas concentration displayed by gas analyzer.</p>
Cgas:	<p>Average gas effluent concentration.</p>

Emissions Tab

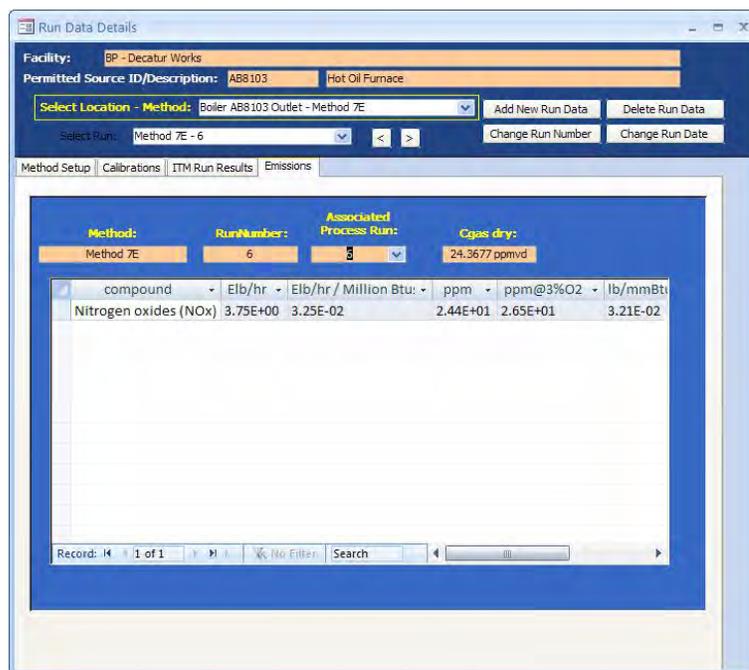

Figure 65 - Instrumental Method: Emissions Tab

This shows the calculated emissions/concentrations for each compound by run. Column headings other than “*compound*” are based upon the output units selected in the “*Emissions / Concentrations*” area of the “*Setup / Test Plan*” or the “*Method Setup*” of the Run Data Details.

Some of the more common column names are as follows:

Compound: Analyte name from Setup window.

Elb/hr: Emissions, pounds per hour.

Elb/hr/Million Btu: Pounds per Million Btu ... Units in this form are calculated from the emissions rate (pounds per hour) and the process rate (Million Btu per hour). The full text of the divisor (million Btu ...) is dependent on the choice of process variable selected under the “*Process Rate Parameter*” heading of the “*Emissions / Concentration*” area of the “*Method Setup*” tab.

ppm Concentration, parts per million.

ppm@7%O2: Concentration, pounds per million corrected to 7% O₂.

Lb/mmBtuO2 The pounds per million Btu of fuel combusted when calculated using one of the F-factors.

Performance Specification Data

The ERT calculates Continuous Emissions Monitoring Systems (CEMS) Relative Accuracy Test Audits (RATAs) and Calibration Drift using the instrumental test method results from ERT data entered for Method 3A, Method 10, Method 7E or Method 6c as described above and the manual

entry of the continuous emissions monitoring systems data as described below. The first step in the process is the addition of at least nine test runs of the applicable reference method. The user should verify that the reference method emissions are in the same units generated by the CEMS. Next, you should click on the “**Add New Run Data**” as described in Chapter 5: Add New Run Data - Directly. When you select one of the performance specifications, you will notice that the fields for “**Run Number**” and “**Run Date**” are no longer visible. Clicking on “**Add Run Data**” will create the forms for documenting the performance specification. To enter data into the performance specification forms you should select the performance specification from the “**Select Location – Method:**” menu. The performance specification “**Run Data Details**” screen as shown in Figure 66 - Performance Specification Run Data Details. will be displayed.

Run	RunDate	StartTime	EndTime	PPM	Lb/Hr	Lb/MMBTU	Exclude Run
1	7/4/2012	8:45 AM	9:05 AM				<input type="checkbox"/>
10	7/4/2012	12:13 PM	12:34 PM				<input type="checkbox"/>
11	7/4/2012	12:35 PM	12:56 PM				<input type="checkbox"/>
2	7/4/2012	9:06 AM	9:27 AM				<input type="checkbox"/>
3	7/4/2012	9:27 AM	9:47 AM				<input type="checkbox"/>
4	7/4/2012	9:58 AM	10:18 AM				<input type="checkbox"/>
5	7/4/2012	10:19 AM	10:39 AM				<input type="checkbox"/>
6	7/4/2012	10:40 AM	11:00 AM				<input type="checkbox"/>
7	7/4/2012	11:10 AM	11:30 AM				<input type="checkbox"/>
8	7/4/2012	11:31 AM	11:51 PM				<input type="checkbox"/>
9	7/4/2012	11:52 AM	12:12 PM				<input type="checkbox"/>

Figure 66 - Performance Specification Run Data Details

There are two data entry screens for performance specifications. The one labeled “**CEMS Information and Run Data**” is used to document the RATA of the CEMS, while the one labeled “**CEMS Calibration Drift Data**” is used to document the performance of the seven day calibration drift evaluation. Figure 66 is a screen shot of the blank tab for entering RATA CEMS information and Figure 67 is a screen shot of the blank tab for entering CEMS calibration drift information.

The RATA CEMS tab has two fields for the date of the relative accuracy assessment, five fields for the entry of the applicable emissions limitations and three columns of fields for the reported CEM emissions data. As shown in Figure 66 - Performance Specification Run Data Details the columns labeled “**Run**”, “**RunDate**”, “**StartTime**” and “**EndTime**” are pre-populated with information from the reference method test runs. The three columns for entry of CEMS data

include “*PPM*”, “*Lb/Hr*” and “*Lb/MMBTU*”. The reference method emissions calculated by the ERT for these pre populated test run identifiers will be used in the calculations of the relative accuracy but are not presented in this CEMS data entry screen.

Field descriptions for the CEMS Information and Run Data are:

<i>RA Start Date:</i>	This is the date of the first test run for evaluating the relative accuracy of the CEMS.
<i>RA End Date:</i>	This is the date of the last test run for evaluating the relative accuracy of the CEMS.
<i>PPMv Standard:</i>	This is the emissions limitation standard when the measured pollutant is not corrected for dilution.
<i>Oxygen Correction:</i>	This is the oxygen concentration used to standardize the concentration values for the measured pollutant.
<i>PPM@O2 Standard:</i>	This is the emissions limitation standard when the measured pollutant is corrected for dilution using the measured oxygen concentration.
<i>Lb/Hr Standard:</i>	This is the emissions limitation standard when the measured pollutant is expressed as an hourly emissions rate.
<i>Lb/MMBTU Standard:</i>	This is the emissions limitation standard when the measured pollutant is expressed as a ratio of the mass emissions per unit of fuel energy.
<i>Run:</i>	These are the run numbers which are pre-populated from the reference test method for the pollutant and the parameter used for correcting the pollutant.
<i>Run Date:</i>	These are the dates of the test runs which are pre-populated from the reference test method for the pollutant and the parameter used for correcting the pollutant.
<i>Start Time:</i>	These are the start times of the test runs which are pre-populated from the reference test method for the pollutant and the parameter used for correcting the pollutant.
<i>End Time:</i>	These are the end times of the test runs which are pre-populated from the reference test method for the pollutant and the parameter used for correcting the pollutant.
<i>PPM:</i>	These are the uncorrected concentrations for the pollutant or diluent measured by the CEMS during the reference method test runs. These values are entered by the user.

- Lb/Hr:*** These are the emissions rates in pounds per hour for the pollutant measured by the CEMS during the reference method test runs. These values are entered by the user.
- Lb/MMBTU:*** These are the emissions factors in pounds per million Btu fuel combusted for the pollutant or diluent measured by the CEMS during the reference method test runs. These values are entered by the user.
- Exclude Run:*** This column contains boxes which may be checked to exclude runs from the relative accuracy calculations. Up to three boxes may be selected but at least nine runs must remain for calculation of the RA. All runs (including those selected for exclusion) will be presented in the RATA report. All runs which have not been excluded will be used to calculate the relative accuracy.

Data entry is required in only those standards fields where there is an emissions limitation for which the CEMS is used for measuring the pollutant of interest. Those fields for the other units of emissions standards may be left empty. Users are required to enter CEMS data only for the units of emissions of the standards which apply to the tested source. If there are emissions limits in two or more sets of units, the user will need to enter data for all of the units of standards which apply. When an emissions standard in units of PPM corrected to a specified oxygen level is used, data entry is required for EPA Method 3A for O₂, the reference method for the pollutant, the CEMS O₂ concentration and the uncorrected CEMS pollutant concentration. The ERT will use the diluent concentrations to calculate the corrected pollutant concentrations.

High: These are the results of the daily high calibrations of the CEMS.

After entering the required data in either the “*CEMS Information and Run Data*” tab or the “*CEMS Calibration, Drift Data*”, the results can be displayed by clicking on the “*Relative Accuracy Results*” box or the “*Calibration Drift Results*” box below the data entry fields. For the calculation of the RATA results, users are permitted to exclude up to three test runs from the calculations by checking the box in the “*Exclude Run*” column. Users which select more than three runs for exclusion will receive a pop-up warning stating that they can only exclude up to 3 runs. Also, users that do not leave nine or more runs available for calculating the relative accuracy will receive a pop-up warning stating that they must have 9 runs for the RA report. The ERT will not perform calculations if there are not nine runs remaining.

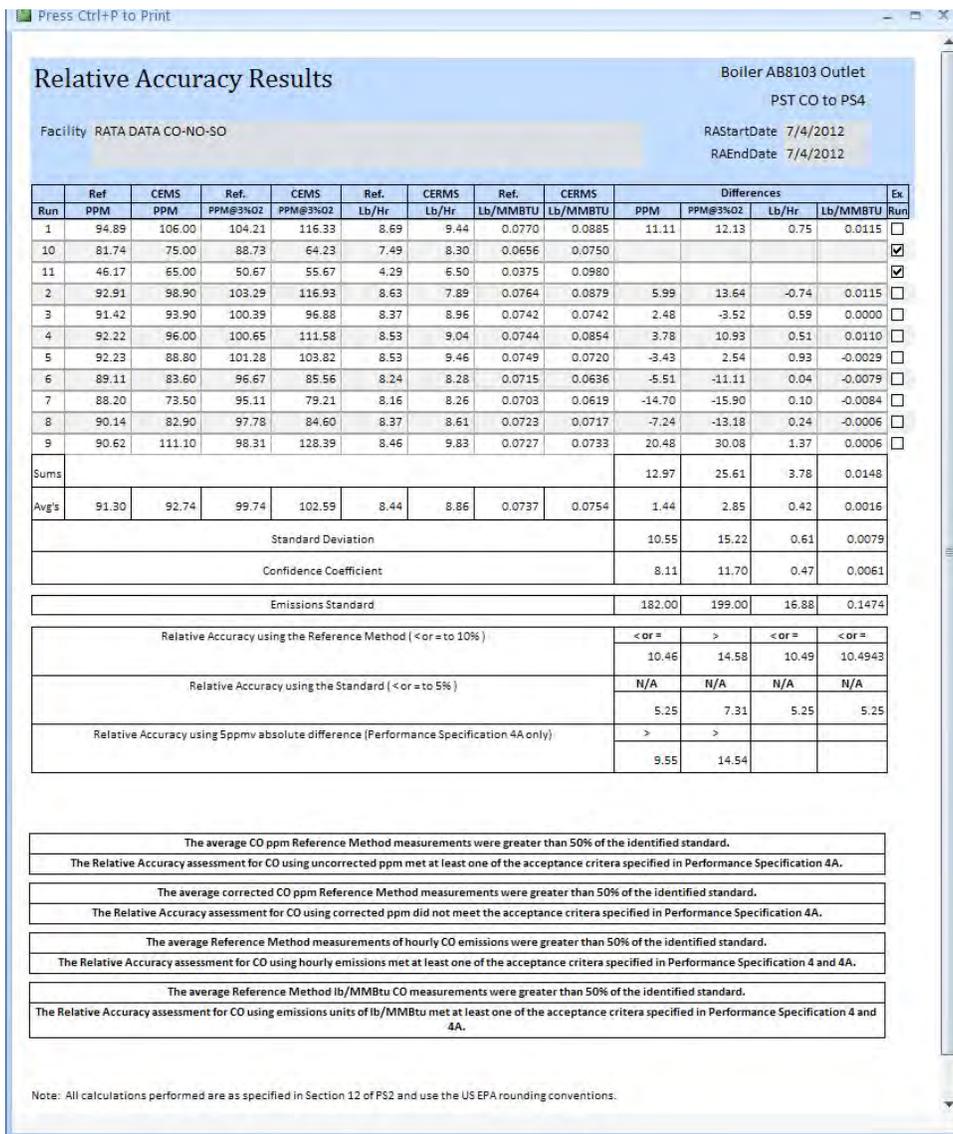

Figure 68 - RATA results report

A Relative Accuracy results report similar to Figure 68 - RATA results report will be produced if the “**Relative Accuracy Results**” box is selected. This report includes the ERT calculated emissions for the reference test method, the emissions the user entered for the CEMS, the differences between the reference test method and the CEMS and the averages of each of the data selected for inclusion by the user. Below the averages of the differences, the RATA results report presents the calculated standard deviation, the confidence coefficient, the relative accuracy calculations using the reference method and the relative accuracy calculations using the emissions standard. The descriptions to the left of the calculations of the relative accuracy provide a summary of the acceptance criteria and when they are to be applied. Above each of the calculated values for the Relative Accuracy is one of the mathematical symbols “< or =” or “>” indicating the relative value of the Relative Accuracy compared to the acceptance criteria. While the Relative Accuracy values are presented to more than two significant figures, the symbols are assigned based upon the US EPA criteria for significant figures and rounding conventions. The EPA conventions for calculating and reporting were clarified in a June 6, 1990 memorandum titled *Performance Test Calculation Guidelines* which is available at <http://www.epa.gov/ttn/emc/informd/tid-024.pdf> and reiterated in the Office of Compliance National Stack Testing Guidance which is available at <http://www.epa.gov/compliance/resources/policies/monitoring/caa/stacktesting.pdf>. Below the descriptions and relative accuracy calculations are descriptions of the decision criteria used for selecting the performance criteria calculation and a written statement comparing the calculated results to the acceptance criteria. While Figure 68 presents calculations for all units of emissions, a RATA for only one set of units will have printed results for only the units where there are standards, calculated test results and CEM data.

Likewise, if the “**Calibration Drift Results**” box is selected, a report similar to Figure 69 - Calibration Drift Results report will be produced. The calibration drift report includes the measured responses for the daily calibrations at the low and high values, the differences between the responses and the calibration standard for each day, and the percent of span that the differences represent. Below the calibration drift results the report presents the criteria specified in the performance specification for acceptance,

Figure 69 - Calibration Drift Results report

Process Data

Click the “**Process Data**” button in the “**Test Data**” area of the main menu to display the “**Process Data**” screen. This allows entry of process run data, APCD run data and lab data that was identified to be captured in the test plan.

Process Run Data Tab

Process Data Details

Facility: Environ Mental Concious Furniture Co.

Permitted Source ID/Description: DR2 Dryer 2

Process Run Data | APCD Run Data | Lab Data

Run: 1 Add A Run Delete This Run

Name	Value	Units	Target Lo	Target Hig	comm
Anthracite Burned	4	Tons	0	4	
Oxygen Concentration	0	percent		4	
Carbon Monoxide concentrz	0	ppm		250	
Dryer Wood Feed	0	Tons/Hr		125

*					

Record: 1 of 3 No Filter Search

Figure 70 - Process Data: Process Run Data Tab

This list was created during the test plan on item 4a. (See **Figure 22 - Test Plan Process/APCD Add Process Form** section for more information).

The name, units, target low and target high are prefilled with data from item 4a, and *are not editable*. If corrections to the information shown under these columns are required, you should close this window and click on “**Process Info**” under the “**Setup / Test Plan**” area of the “**Main Menu**”. Corrections to the information in the first line which is highlighted yellow may be a default established by the selection of the SCC. However, if the name and units were established by the user during the selection of the SCC, you may be able to return to the SCC selection area under the “**Setup / Test Plan**” to revise this information. Process activity rate information (i.e., the name is a production or feed material parameter and the units have a denominator of time), consistent with a measured emissions rate calculated by the ERT may be paired with the emissions rate in the “**Emissions**” tab of “**Run Data Details**” for either an isokinetic or instrumental test method.

- Enter the value for the process name for the duration of the run. Enter comments as needed for the run.
- Move to the next or previous runs by using the navigation bar at the bottom of the screen.

Figure 71 - Run Navigation Bar

- Click the “**Add a Run**” button to add a new process run.
- To delete run data, highlight the row by clicking on the gray cell before cell containing the name of the run. Click on “**Delete This Run**”. The first run cannot be deleted. You should be extremely wary of deleting individual rows as this may introduce unintended consequences where this row is used to calculate a process based emissions. You may wish to use Windows Explorer to duplicate the Project Data Set prior to performing a row deletion and evaluate the results of the deletion.

Note: Only the “Value” and “Comments” columns are active on this tab.

APCD Run Data Tab

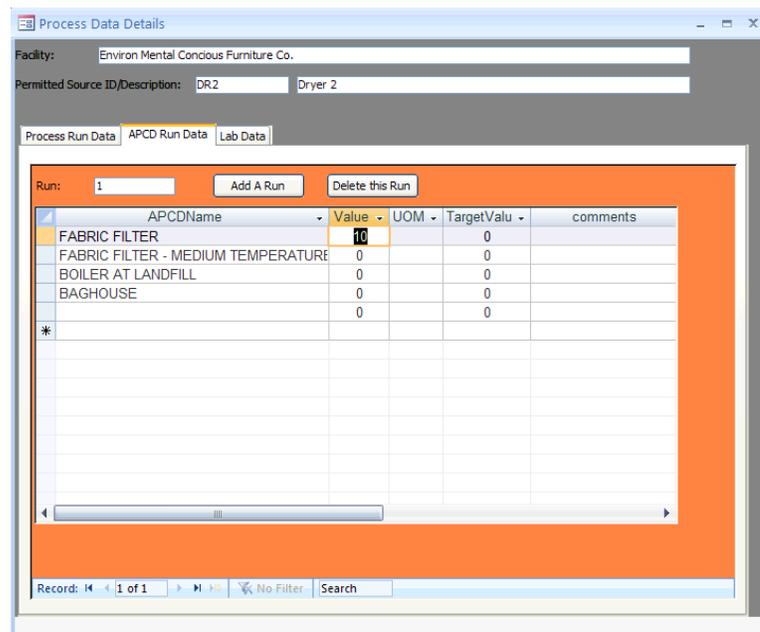

Figure 72 - Process Data: APCD Run Data Tab

This list was created during the test plan on item 5b. (See **Figure 24 - Test Plan Process/APCD Control Devices Editing and Inserting options** section for more information). Using the data from item 5b, the “*APCD Name*”, “*UOM*”, and “*TargetValue*” are prefilled.

- Enter the value for the APCD parameter associated with the name for the duration of the run.
- Enter comments for the APCD run as needed.
- Move to the next or previous runs by using the navigation bar.

- Click the “**Add a Run**” button to add a new process run.
- Click the “**Delete This Run**” button to delete run data.

*Note: Only the **Value** and **Comments** columns are active on this tab.*

Lab Data Tab

Record: 1 of 1 No Filter Search

Figure 73 - Process Data: Lab Data Tab

This list was created during the test plan on item 4b. (See Figure 23 - Test Plan Process/APCD Add Lab Form section for more information).

- Enter the value for the lab data results for the parameter identified by the name for the duration of the run. You should insure that the value entered is consistent with the units of measure specified.
- Enter comments for the value entered in the lab data run as needed.
- Move to the next or previous runs by using the navigation bar.
- Click the “**Add a Run**” button to add a new process run.
- Click the “**Delete This Run**” button to delete run data.

*Note: Only the **Value** and **Comments** columns are active on this tab.*

Tester DQ Assessment

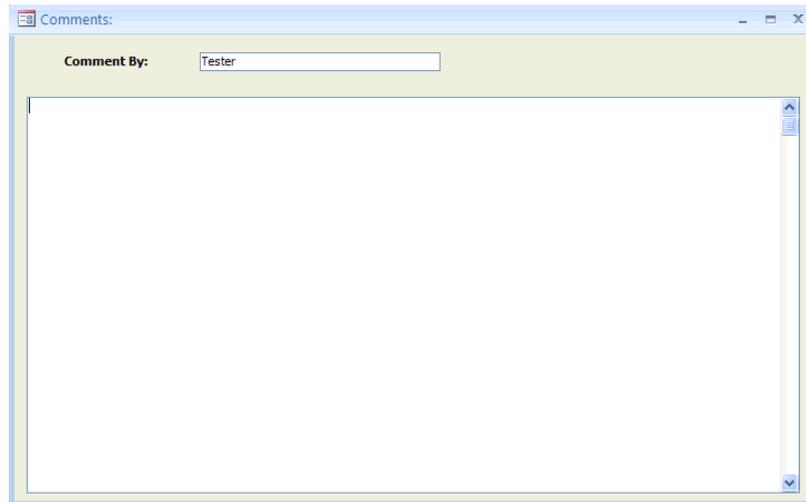

Figure 74 - Tester Comments Window

Click the “*Tester DQ Assessment*” button in the “*Test Data*” area of the “*ERT Main Menu*” to allow entry of any comments from the tester on: 1) their assessment of the validity of the test, 2) the representativeness of the process operation, 3) an assessment of the achievement of the data quality objectives, 4) the use of the data quality indicators supporting the statements about meeting the DQO’s, 5) documentation on the conduct of the tests, 6) explanations of the test results, and 7) any other statements about the use of the test for other purposes.

This is a freeform text field that is unlimited in the amount of text that can be entered.

This text will be included in the printed test report.

The “*Tester DQ Assessment*” tab can be used to enter a narrative of the test plan, any deviations from methods, mishaps or problems during testing, a summary or discussion of the results, etc. **It is highly recommended that testers provide comments in this section.**

Attachments

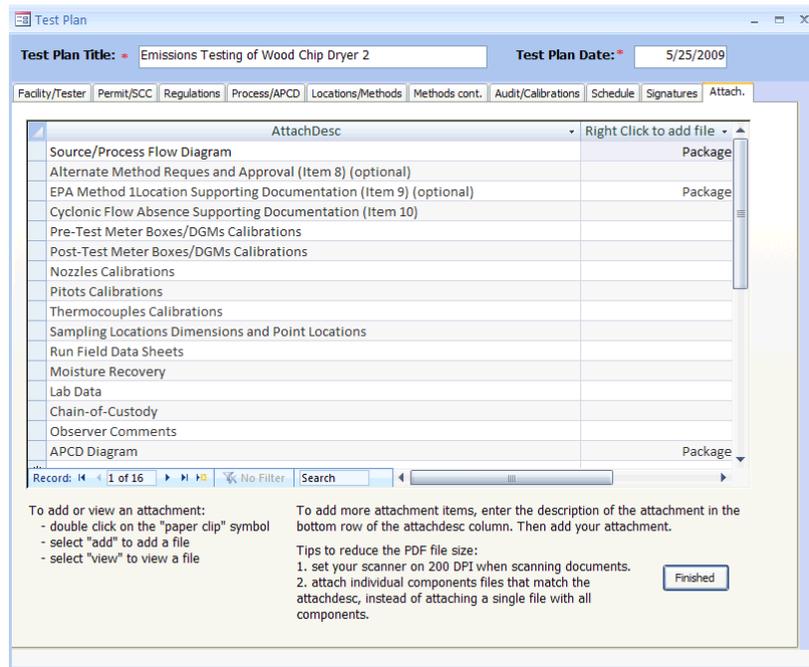

Figure 75 - Attachments Tab

Once the test data have been entered, click “**Attachments**” in the “**Test Data**” area of the “**ERT Main Menu**”. This will display the Attachments screen from the test plan.

All documents to support the test need to be included as attachments here.

See the “**Attachments Screen**” section of the Test Plan for more information on how to attach files.

Report Verification

Final Test Report Verification

Permitted Facility Representative

Name: Terrence M. Welch
Title:
Company: BP - Decatur Works
Email:
Date Signed: 4/4/2012

Based on information and belief formed after reasonable inquiry, I certify that the statements and information in this test report are true, accurate, and complete.

Testing Company Representative

Name: Jeremy Hutchens
Title: Project Manager
Company: Alliance Source Testing, LLC
Email: jeremy.hutchens@stacktest.com
Date Signed: 4/4/2012

I have reviewed all testing details and results in this test report and hereby certify that the test report is authentic and accurate.

Figure 76 - Final Test Report Verification Window

Click the *Report Verification* button in the *Test Data* area of the *ERT Main Menu*.

- **Permitted Facility Representative:** The person authorized to represent the facility being tested. Enter the representative's name, title, company and date reviewed.
- **Testing Company Representative:** The person authorized to represent the testing company. Enter the representative's name, title, company and date reviewed.

Note: This is NOT an electronic signature! The person submitting the final ERT file to EPA's Central Data Exchange (CDX) will be required to register as a report submitter for the facility and receive an Cross-Media Electronic Reporting and Recordkeeping Rule (CROMERR) compliant electronic signature agreement which will allow that individual to provide an electronic signature with the submission of the file to EPA through the CDX.

Chapter 6: Test Plan Review

Test Plan Review

The screenshot displays a web-based form titled "Test Plan Review". At the top, it shows the "Test Plan Title" as "Emissions Testing of Wood Chip Dryer 2" and the "Test Plan Date" as "5/25/2009". A "State Review Accepted (Y/N)" field is present on the right. Below the title, there are tabs for "Facility/Permit", "Regulations", "Process/APCD", "Locations/Methods", "Methods cont.", "Audit/Calibrations", "Schedule", "Signatures", and "Attach".

The form is divided into several sections:

- Facility Name:** Environ Mental Concious Furniture Co.
- Address:** 666 66th St N Ave
- City:** Boisenberry
- State/Zip:** NC 27854-4866
- Contact:** Enviro M. Concious
- Phone:** (919) 666-2626
- Fax:** (919) 666-6262
- email:** enviro.concious@enviroconcious.com
- Industry /SCC/HAIS:** 30701415
- FINS:** 27262
- Latitude:**
- Longitude:**

Testing Company: Emissions Factors & Policy Applications Group

Address: OAQPS/EMAD (C312-02)

City: Research Triangle Park

State/Zip: NC 27711

Contact: Ronald E. Myers

Phone: (919) 541-5407

Fax: (919) 541-1065

email: myers.ron@epa.gov

SCC/Desc.: 10300103
External Combustion Boilers - Commercial/Institutional - Anthracite Coal - Hand-fired

Air Permit Number: NC666-1234

Permitted Source ID and Name: DR2 Dryer 2

Permitted Maximum Process Rate: 175 Tons per Hour

Maximum Normal Operation Process Rate: 150 Tons per Hour

Target Process Rate for Testing: 125 Tons per Hour

On the right side, there are three review sections, each with a "Yes" checkbox, a "No" checkbox, and an "Add/View Comment" button:

- Facility Info:** Yes No
- Test Co. Info:** Yes No
- Source Info:** Yes No

A "Next Page" button is located at the bottom right of the form.

Figure 77 - Test Plan Review Screen

This section of the ERT may be used by a person evaluating the proposed source test protocol and if necessary identifying areas requiring improvement. Generally, if performed, the evaluation is performed by a regulatory agency employee. Upon receipt of a completed test plan, the reviewer (typically the state or other delegated authority) may access the database by selecting the appropriate project data set (see *Selecting a Project Data Set* section for more information on selecting a project data set) and clicking "*Test Plan Review*" in the "*Test Plan Review*" area of the "*ERT Main Menu*".

The test plan will be displayed in a split window that contains the test plan as submitted for review on the left side and several areas with check boxes and buttons to access comment areas on the right side. Each of the areas are associated with key elements of the test plan. The left side of the test plan review is nearly identical with respect to the tabs identifying the type of information and the layout of information contained on each tab area to the test plan. This provides an organized "*step-through*" process for the test plan review.

Click the "*Yes*" or "*No*" button on each section based on whether the information provided is acceptable or not. If "*No*", click the "*Add/View Comment*" button to explain why the information is not acceptable and request what additional information is needed.

Upon completion, update the "*Submittal History*" and return the Project Data Set to the tester. (See the *Project Submittal History* section for more information on how to update the history).

Test Plan Review Locations/ Methods

Test Plan Title: Emissions Testing of Wood Chip Dryer 2 Test Plan Date: 5/23/2009 State Review Accepted (Y/N)

6. Please enter sampling location information. (all dimensions in inches)

Location (double click to view/edit)	Inlet/Stack	Total Trave	Ports	Round Duct Diam	Duct Len	Duct Vel	Eq
inlet	Inlet	10	2	19.9	0	0	
stack	Outlet	16	2	72	0	0	

(Note: UpstreamDist = Distance from upstream disturbance
DownstreamDist = Distance from downstream disturbance)

7a. Please provide the following information for each test parameter.

Location	Target Parameter	Light Line	Test Method	Num Test Runs	Test Run Duration
Inlet	Arsenic	10	Method 29	3	64
Inlet	Calcium	0	Method 29	3	64
stack	Chromium	22	Method 29	3	64
stack	Lead	22	Method 29	3	64
stack	Manganese	22	Method 29	3	64

7b. Please select the Emissions / Concentrations for each location.

Location	Method	Emission/Concentration	Corrected Air	Corrected %
Inlet	asdhuff	ppm corrected	O2	4
Inlet	aschuff	ppm		0
Inlet	aschuff	ppm		0
Inlet	aschuff	ppm		0
Inlet	aschuff	Random BTU using O2		0
Inlet	aschuff	BTU		0

QA

Figure 78 – Test Plan Review Locations/Methods Tab

For Item 6, the reviewer will click “Yes” or “No” on each section depending on whether the information provided is acceptable or not. If “No”, click the “Add/View Comment” button to explain why the information is not acceptable and request what additional information is needed.

In Item 6, below the Yes or No response, click on the “QA” button, as the red box in Figure 78 indicates, to open the quality assurance calculations screen. There are two screens for the calculations depending on the selection of location as “inlet” or “stack.”

DSCFM @ Saturation:	Dry standard flow rate in cubic feet per minute.
Assumed Stack O2 %:	Oxygen concentration of sampled gas stream, percentage.
<u>Traverse Details:</u>	
Non-Particulate Traverse:	Checked if “Yes” if the test location includes non-particulate traverse.
Downstream From (“):	Distance to downstream disturbance in inches.
Upstream From (“):	Distance to upstream disturbance in inches.
Diameters to Disturbance/Downstream:	Number of equivalent diameters to the downstream disturbance.
Diameters to Disturbance/Upstream:	Number of equivalent diameters to the upstream disturbance.
Traverse Point Calculation/Downstream:	Calculated number of traverse points from downstream disturbance.
Traverse Point Calculation/Upstream:	Calculated number of traverse points from upstream disturbance.
Required Traverse/Flow Methods:	Required Method for calculation of flow rate.

NOTE: Fields with “#Error” is a result of missing or incomplete run data.

Figure 80 – QA – Stack Protocol Evaluation Calculations

In the *Protocol Evaluation Calculations* screen, select the *location* as “stack”. The calculations from the pre-selected data as provided in Item 6 will fill the orange fields. Currently editable fields have white background. The calculations based on the data entered in the “*Regulations*”, “*Locations*”, “*Methods*” and “*Concentrations*” areas of the test plan will fill the fields with gray background. Use the calculations to determine whether the state review is accepted or not.

The red background of the “*USE*” column under “*Reporting Threshold Allowables*” are the values which the tester/reviewer should use in calculations of the selected method. This calculated value is based on a New Jersey formula using the look-up values in the following columns.

Check the box if the test run includes non-particulate traverse.

The editable fields beneath the comparison of *EPA Method 25 vs. 25A* determine the calculation of the outlet ppm.

The editable fields in the “*Metals*” section include the run duration (hr), the front half sample volume, and the back half sample volume. They directly affect the calculations in the gray boxes. The columns beneath *ICAP*, *AAS/CVAAS*, *GFAAS* and *ICPMS* can have either a green, yellow or red background. The green color indicates the estimates for the calculated values fall within EPA measurement capabilities at the compliance limits. Red indicates that the calculated values fall outside the EPA measurement capabilities at the compliance limits. Yellow indicates there is a potential issue somewhere within the proposed test protocol or analytical finish. It may indicate that the estimated values for the test run or analytical finish are close to the measurement capabilities of the selected combination compared with the compliance limits.

The editable fields of organics & gases include the sample volume (L) and the impinger start volume (mL). The changes affect the calculations for the parameter.

The fields below the calculations for inlet are as follows:

Parameters of Interest:

Grains * 64.799 = mgs:	Conversion of grains to milligrams.
Lb/hr limit:	Flow limit in lb/hr of location of run.
Mg/30cf:	Milligrams per sample rate, where the minimum is 30 cubic feet.

EPA Method 25 vs. 25A

Inlet VOC lbs:	Pounds of volatile organic compounds in inlet stream.
% Carbon:	Percent of weight fraction of carbon in VOC.
% Production:	Percent of carbon of VOC (i.e., %carbon * Inlet VOC).
CE:	Capture efficiency typically from permit.
DE:	Destruction efficiency, typically found on permit.
Outlet ppm:	Emission of carbon through outlet in parts per million. If emission is less than 50 ppm carbon, select Method 25A. If emission is greater than 50 ppm carbon, select Method 25.

Reporting Threshold Allowables:

Parameter:	The analyte/ target parameter reported.
Method:	The allowable test method for the analyte.
USE:	The calculated value based on the New Jersey lookup table values following.
Reporting lb/yr:	The look up values for number of reported pounds per year.
Lbs/hr:	The analyte allowable pounds per hour.
SOTA lbs/yr:	The analyte value in lbs per year in state-of-art stack.
Lbs/hr:	The analyte in pounds per hour in state-of-the-art stack.
Reporting lb/hr:	The reportable analyte in pounds per hour in state-of-the-art stack.
SOTA tons/year:	The analyte measurement in tons per year in state-of-the-art stack.

Metals:

Run Duration (hr):	The number of hours of duration of the run. The selection will affect the calculations of the table below.
Front Half Sample Volume:	Select the volume of the front half of the stack in run. The selections are from 30 to 500 in increments of 5.
Back Half Sample Volume:	Select the volume of the back half of test sample of the stack in run. The selections are 25 to 500 in increments of 5.
Parameter:	The test analyte being measured.
Lb/hr limit:	The test analyte's test limit in pounds per hour.
Ug/train:	Micrograms of analyte per sampling train.

ICAP:	Calculated Inductively Coupled Argon Plasma.
AAS/CVAAS:	Atomic Absorption Spectrometry technique utilizing cold vapor detection technique of measuring the analyte in lower concentration ranges.
GFAAS:	Atomic Absorption Spectrometry technique utilizing graphite furnace technique of measuring the analyte in lower concentration ranges.
ICPMS:	Inductively coupled plasma/mass spectrometry technique for measuring trace amounts of the analyte.
Anal. Ug/ml:	Calculated micrograms per milliliter of the analyte.
Mg/dscm 7% O₂:	Micrograms of analyte particulate per dry standard cubic meter corrected to 7% O ₂ .
<u>Organics & Gases:</u>	
Sample Volume (L):	Select the test sample volume collected in liters. The list range is from 15 to 180 in increments of 15.
Impinger Start Volume (mls):	Select the volume in the impinger at the start of the test, measured in milliliters. The range is from 0 to 20 in increments of 1.
Parameter:	The test run selected parameters for organics and gases.
Lb/hr Limit:	The pre-selected pound/hour limit of the parameter.
MW:	The calculated molecular weight of the parameter.
~ ppm limit:	The calculated approximate parts per million of the parameter.
Solubility:	The calculated solubility of the parameter, if applicable.
Boiling Point:	The calculated boiling point of the parameter, if applicable.
Polarity:	The calculated polarity of the parameter, if applicable.
~ ug/Train:	The approximate calculation of micrograms per sampling train.
Imp ugs:	The calculated micrograms of the impinger.

Chapter 7: Test Data Review

All of the access buttons for test data review appear on the “*ERT – Main Menu*”. They include “*Observer Comments*”, “*Test Reviewer Comments*”, “*Test Review*”, and “*Quality Assessment Questions (QAQ’s)*”.

Test data can be reviewed generally in one of two ways:

1. If an ERT submittal package was submitted through EPA’s Central Data Exchange (CDX), the data can be accessed in Webfire (see instructions below).
2. States or other delegated authorities can review test data if the ERT file is sent to them (via email, CD, etc).

How to Obtain and View ERT Submissions to WebFIRE

1. Go to EPA’s WebFIRE site: <http://cfpub.epa.gov/webfire/>.
2. Click the “Search ERT Submissions” button.
3. Enter your desired search criteria and click the “Submit Search” icon OR you can leave the search criteria fields blank (this may result in a long list of files).
4. Two types of files may be listed on the search results page:
 - i. Zip files – these files contains a Project Data Set (PDS) file created by the ERT application. To review a test report, use one of the following procedures:
 1. Click the name of the zip file you wish to review and click “*Open.*”
 2. Then click “*Extract*” and save the file to a location you will remember.
 3. Open the ERT application.
 4. In the ERT, click “*Select Project Data Set*” and choose the file (it will have an extension of either .accdb or .mdb, depending on the version of the ERT that was used to create the file). You will see that the location and name of the extracted file will be displayed in the “*Current Project Data Set*” box

OR

1. Click the name of the zip file you wish to review and click “*Save.*”
2. Save the zip file to a location you will remember.
3. Open the ERT application.
4. In the ERT, click “*Select Project Data Set*” and choose the zip file. The ERT application will extract the PDS from the zip file and store it in the same directory as the zip file. You will see that the location and name of the extracted file will be displayed in the “*Current Project Data Set*” box.
5. **CAUTION:** Use this procedure only the first time you open the PDS. The use of this procedure will overwrite the existing PDS and you may

lose any saved changes. Subsequent times that you open the PDS, using step 4 of the first procedure will preserve changes you made to the PDS.

- ii. XML files – These files contain high-level summary information contained in the PDS and are primarily for EPA use only.

Observer Comments

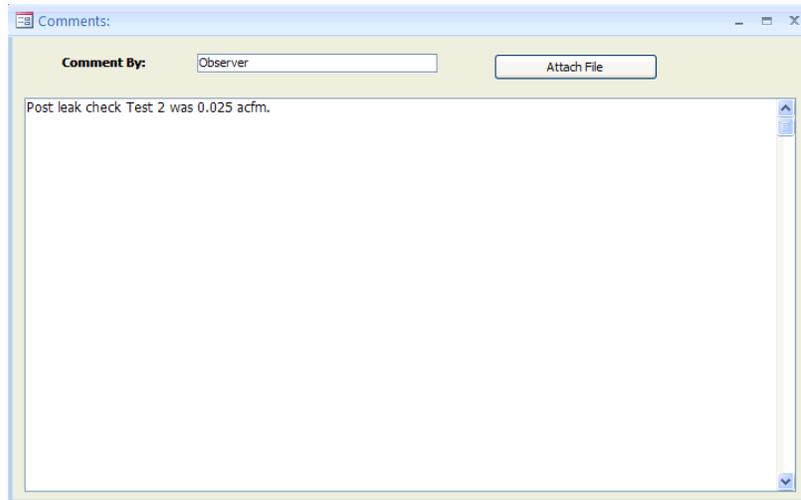

Figure 81 - Observer Comments Window

In this tab the observer may either enter comments directly into the text box, or attach a file that contains his/her comments. (See [Attachments Screen](#) for more information on how to attach a file).

Test Reviewer Comments

Figure 82 - Test Reviewer Comments Window

In this tab the test reviewer can enter comments directly into the text box.

Test Review

The descriptions and the screen shots from the ERT are those associated with the ERT dated September 2012. A revised and more functional test review component of the ERT is under development and is expected to be available by the end of the calendar year. We are including the functionality for this review to provide users with examples of what the ERT can perform so that any comments we receive will be based upon the experience of knowledgeable users.

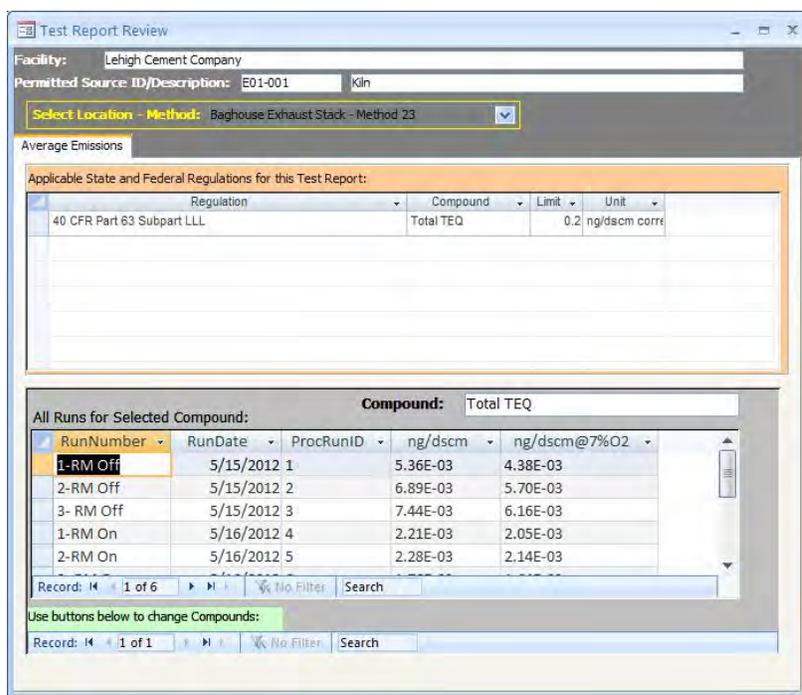

Figure 83 - Test Report Review Screen

Upon receipt of a completed test report, you may access and review the data by selecting the appropriate project data set (see the *Selecting a Project Data Set* for more information on selecting a project data set) and clicking the “**Test Review**” button in the “**Test Data Review**” area of the “**ERT Main Menu**”.

The top part of the screen shows the applicable state and/ federal regulation for the test report as was entered in Item 2 of the *Regulations Screen* of the test plan section of the “**ERT Main Menu**”.

Select from the compliance list, “**Yes**” or “**No**”, depending on whether the pollutant compound of the regulation falls within the compliance limits.

Select the location and method to view from the “*Select Location – Method*” pick list.

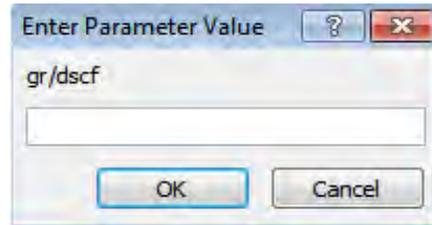

Figure 84 - Test Report Review Enter Parameter Value

If an “*Enter Parameter Value*” screen like Figure 84 appears repeatedly, (in this case, gr/dscf) appears, the emissions parameter corrected to a CO₂ or O₂ concentration has been selected without first selecting the uncorrected concentration parameter. To correct this error, go back to the test plan on the “*ERT Main Menu*”. Select the “*Location/Method*” tab. Click on the “*Add Emissions/Concentrations*” button of Item 7b. Select the uncorrected parameter identified in the “*Enter Parameter Value*” screen. This screen will not appear and the corrected concentration values will be calculated.

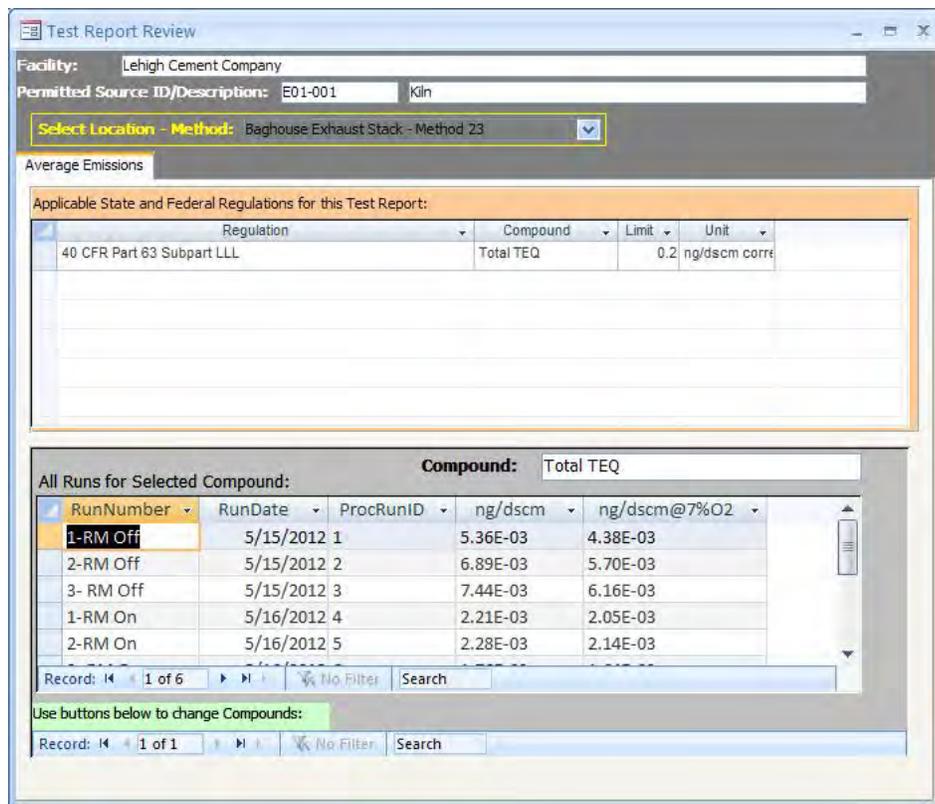

Figure 85 - Test Report Review Screen with selected Location - Method

The bottom part of the screen shows the emissions for each compound.

Click on the record arrows in the bottom left of the screen to scroll through the compounds.

The columns are as follows:

Applicable State and Federal Regulations for this Test Report:

Regulation:	The title of the regulation (auto-populated from information entered in the test plan).
Compound:	The analyte applicable in the regulation.
Limit:	The upper limit of the analyte concentration.
Unit:	The unit of regulation measurement.
Compliance:	The selection of “Yes”, “No”, or “Indeterminate” whether the analyte for the regulation falls within compliance limits.

All Runs for Selected Compound:

RunNumber:	The run number of the compound tested.
RunDate:	The date of the run.
Gr/dscf:	In the example in Figure 85, the uncorrected parameter was selected as grain per dry standard cubic feet either in the <i>Test Plan</i> , Item 7b, or the <i>Test Data, Method Setup</i> . If the user wants to see any other parameter, go back to either of those locations and select it.
Gr/dscf @ 7% O₂:	The parameter selected corrected to 7% O ₂ .
Elb/hr:	Emission flow, pounds per hour.
Other Emissions Units:	There will be other units of emissions as were established in either the <i>Test Plan</i> or the <i>Test Data, Method Setup</i> .

QAQ's

The descriptions and the screen shots from the ERT are those associated with the ERT dated August 2012. A revised and more functional quality assurance questions component of the ERT is under development and is expected to be available by the end of the calendar year. We are including the functionality for this review to provide users with examples of what the ERT can perform so that any comments we receive will be based upon the experience of knowledgeable users.

Question	Answer	Comment	Showdata
Is a description of test location provided?	Yes/No		Show Data
Is a drawing of the test locations provided?	Yes/No		Show Data
Has a description of test methods used, including deviations from standard procedures, been provided?			Show Data
Has a detailed discussion of sampling conditions been provided?			Show Data
Is a schematic of each sampling train attached?			Show Data
Is a full description of the facility provided?			Show Data
Were the operating parameters for the process being tested reported?			Show Data
Are the parameters monitored by the facility to assess the performance of the control device described?			Show Data
Have all emissions tests specified in the test plan been performed?			Show Data
Dry gas meter pre-test calibration			Show Data

Figure 86 - Test Data Review: QAQ's

The test plan contains a set of quality assessment questions (QAQs) based on the method used for the run. Click on the “QAQ's” button in the “Test Data Review” area of the “ERT Main Menu”.

- Select the “Review Type” to open the list of questions for Completeness or Regulatory.
- Answering “Yes” or “No” will help the agency determine the acceptability of the run data. Select “Yes” or “No” from the answer pick list for each question.
- Enter comments as needed under the comment column for each question.

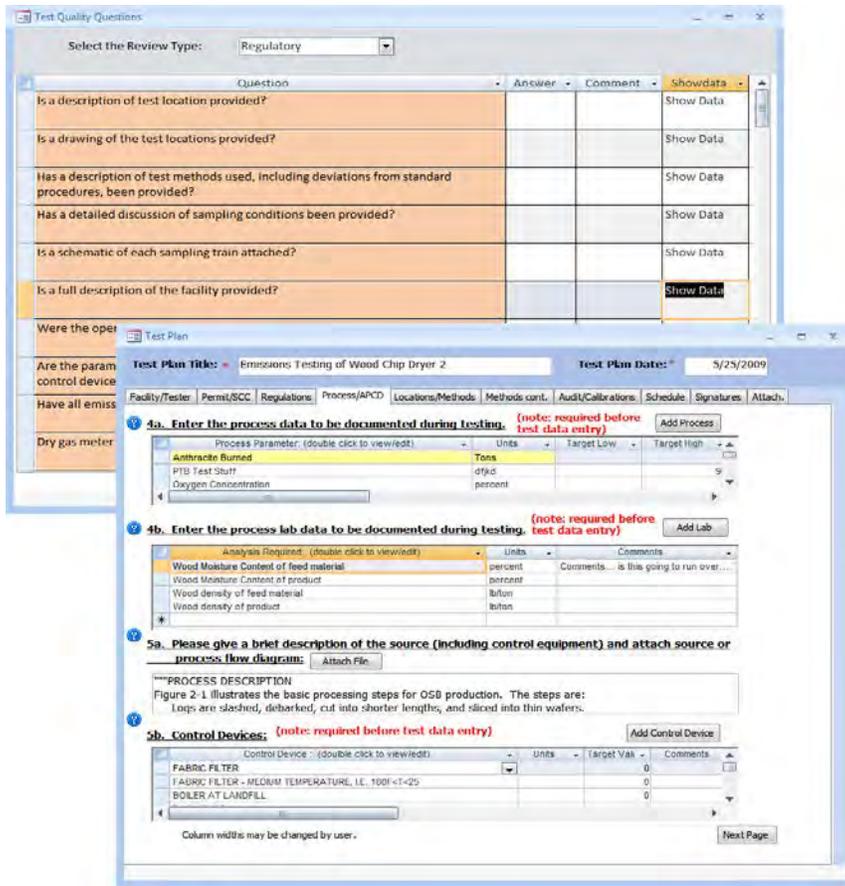

Figure 87 - Test Data Review: QAQ's Show Data

Double-click on the “*Show Data*” cell beside the question to go to the location of the data.

Chapter 8: Printed Reports

In this section of the ERT, you have the option to print whichever section(s) of the test report you choose. You can view the report or table on screen, export the report or table to Microsoft Word, or create a .pdf of the report or table. The type of reports include: “**Full Test Report**”; “**Sampling Location Table**”; “**Test Parameters Table**”; “**Sampling/Stack Data Results Summary Table**”; “**Sampling/Stack Data Results Detail Table**”; “**Emissions Summary Table**”; “**Process Run Data Table**”; “**APCD Run Data Table**”; “**Process Lab Run Data Table**”; and “**Relative Accuracy Results**”.

Industrv NAICS: 30701415	AFS #:	FRS #: 27562	
Air Permit Number: NC666-1234	Permitted Source ID Name: DR2 Dryer 2		
Permitted Maximum Process Rate: 175 Tons per Hour	Max. Normal Operation Process Rate: 150 Tons per Hour	Target Process Test Rate: 125 Tons per Hour	
SCC / Description: 10200104 External Combustion Boilers - Industrial - Anthracite Coal - Traveling Grate (Overfeed) Stoker			

1. What is the specific purpose for the proposed testing?
 *** Determine compliance with NSPS and State SIP emissions limitations
 Establish CAM monitoring parameters as stated in Title V permit***

2. List all state and federal regulations that apply to the proposed testing:

Reg Desc Test	Regulation Description	Compound	Limit	Unit
	PTB	Arsenic	0.002	lb/hr

3. Will the test results be used for other regulatory purposes (e.g. emission inventories, permit applications, etc.) beyond that stated above? If yes, explain.
 Results will be used for establishing total PM (filterable and condensable) emissions as required by State for Consolidated Emissions Reporting.

4a. Enter the process data to be documented during testing:

Process Parameter	Units	Target Value	Comments
Anthracite Burned	Tons/hr	0	
PTB Test Stuff	df/d	90	
Oxygen Concentration	percent	4	
Carbon Monoxide concentration	ppm	250	
Dryer Wood Feed	Tons/Hr	125	
Dryer Outlet Temperature	deg F	325

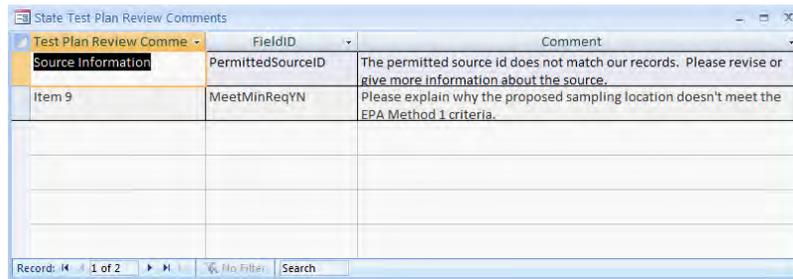

Figure 89 - Final Test Plan Report Print Preview Screen

After the tester has entered the test run, process, and responsible personnel, a hard copy of the test report can be created by clicking the “**Test Report**” button in the “**Printed Reports**” area of the “**ERT Main Menu**”.

Scroll through the pages of the report by clicking on the arrows at the bottom left of the screen.

Press “**Ctrl+P**” to print the page.

Test Plan Review

FieldID	Comment
PermittedSourceID	The permitted source id does not match our records. Please revise or give more information about the source.
MeetMinReqYN	Please explain why the proposed sampling location doesn't meet the EPA Method 1 criteria.

Figure 90 - Agency Test Plan Review Comments Window

After the agency has returned the State Test Plan Review, the tester can click on “*Test Plan Review*” in the “*Printed Reports*” area of the “*ERT Main Menu*”. Click on the “*Test Plan Review*” button to view the agency’s comments on the test plan. No fields are editable in the comments.

The “*Project Data Set Submittal History*” will show if the agency approved the test plan or requires more information.

You can update the test plan based on the agency’s comments, update the “*Submittal History*”, and resubmit the Project Data Set.

Full Test Report

This report includes the full data set for the test plan.

Sampling Location Table

This table includes the information related to all sampling locations. This includes the location, round duct diameter, rectangular duct length, rectangular duct width, equivalent diameter, distance from upstream disturbance, distance from downstream disturbance, number of traverse ports and minimum traverse points. These values were provided in the test plan item 6.

Test Parameters Table

This table includes the full data set for the parameters of the test plan. This includes the location, target parameter, test method, number of test runs, test run duration, sample points and comments.

Sampling/Stack Data Results Summary Table

This report includes a summary of all location – methods run with calculated data with average. These include isokinetic and instrumental test data. The report includes the location-method; run numbers; test dates; run start and finish times; net run time (minutes); dry gas meter volume sampled (dscf); moisture content of stack gas (%); moisture saturation at stack gas temperature (%), or moisture (%); carbon dioxide (%); oxygen (%); average stack gas temperature (degrees F); dry volumetric flow rate (dry scfm); actual wet volumetric flue gas flow rate (acfm); percent isokinetic of sampling rate(%); F-Factor (dscfm/mmBtu @ %O₂); fuel type; Fw; and Fc.

Sampling/Stack Data Results Detail Table

This report includes the details of all location – methods per run. The report includes: location-method; run number; test date; run start and finish time; net traversing points; net run time (minutes); nozzle diameter (inches); pitot tube coefficient; dry gas meter calibration factor; barometric pressure (inches of mercury); average orifice meter differential (inches in water); dry gas meter volume sampled (cubic feet); average dry gas meter temperature (degree F); dry gas meter volume sampled (dscf); total moisture collected (g); volume of water vapor (standard cubic feet); moisture content of stack gas (%); moisture saturation at stack gas temperature (%); dry mole fraction; carbon dioxide (%); oxygen (%); carbon monoxide & nitrogen (%); fuel factor; dry molecular weight (lb/lb-mole); wet molecular weight (lb/lb-mole); flue gas static pressure (inches of water); Absolute flue gas pressure (inches of mercury); average stack gas temperature (degrees F); average velocity head (inches of water); average stack gas velocity (feet/second); stack cross-sectional area (squared feet); dry volumetric flow rate (dry scfm); actual wet volumetric flu gas flow rate (acfm); percent isokinetic of sampling rate (%); percent excess air (%); F-Factor (dscfm/mmBtu @ %O₂); round duct diameter (inches); rectangular duct width (inches); rectangular duct length (inches); Fw; Fc.

Emissions Summary Table

This summary report includes all of the compound data for each run of a location-method. For each compound, the table provides for each run the run number, Mmass (mg); gr/dscf; gr/dscf @ 7% O₂; and average of these.

Process Run Data Table

This data table contains all of the process run data. This includes the name; run number; value provided; UOM; target value; and any comments per run.

APCD Run Data Table

This data table contains the air pollution control device data. This includes the name of the control device; run number; value provided; UOM; target value; and any comments per run.

Process Lab Run Data Table

This data table contains the process parameters requiring lab analysis. This includes the name of the process parameter; run number; value provided; UOM; and any comments per run.

Relative Accuracy Results

This data table contains the reference test method results and the CEM results in the emissions concentration, rate or fuel energy units specified in the reference test method run data emissions and the CEM output, the arithmetic average of the runs performed, the individual run differences between the two measurement systems, the arithmetic averages of the differences, the standard deviations of the differences, the confidence coefficient of the differences, the relative accuracy calculated using the reference method and the relative accuracy calculated using the emissions standard.

Chapter 9: Administration

Help/ System Reports

Figure 91 – The ERT Help /Administration Screen

The administration area of the ERT includes a “*Help /System (Sys) Reports*” button. Clicking on the button will open the ERT Help / administration screen, as seen in Figure 91.

The ERT version and release date are at the top. The ERT support names and contact information is provided at the bottom. The two middle sections include buttons that provide more information or help, and websites for more information or help.

Buttons:

ERT Version History

The ERT Versions from oldest to most current with a listing of the descriptions of the updates.

Field Result Calculations

Broken down per test run tabs, a table of the field, field description, and the formula used to calculate the provided value.

Emission/Concentration Calculations A table providing the formula to provide the calculated value of emission/concentration. The table provides the emission/concentration, and the formula used.

<i>ERT User's Manual</i>	If the file " <i>uman.pdf</i> " is available in the folder with the ERT, the " <i>Users Manual</i> " will be accessed for the user to read. If the file is not available, an alert reminder for the user to download the users manual from the ERT website.
<i>ERT Methods and Target Parameters</i>	Clicking on this tab brings up a table that lists all source test methods which the ERT is capable of documenting. The table identifies the methods by number with their associated description and the compound(s) associated with the test method

Calculations and Decision Criteria Determinations for RATA's

The numerous, interrelated and complex calculations and decision criteria for Performance Specifications 2, 3 and 4 for O₂, CO, NO_x and SO_x preclude a simple listing of all the equations and logic statements in a printed document format. To document the calculations used in the ERT for the Performance Specifications, an Excel Spreadsheet is attached to this page for users to download and examine to assess the calculations, logic decisions and decision criteria. To examine or save the Excel Spreadsheet, open the attachments module of Adobe Acrobat. To open the module, click on the paper clip symbol of the left side of screen. The spreadsheet is named RATA_Evaluation.xlsx. Click on the file and select the option desired (open in the native application or save attachment). This procedure may vary depending on the version of Acrobat that you are using.

Appendix B: Methods

Method Description	Compound
Custom - Select to enter custom method	Custom
Method 1 - 4 - Flowrate / Moisture	% H2O
Method 1 - 4 - Flowrate / Moisture	Flowrate
Method 3A O2 - O2 - Instrumental	O2
Method 3A CO2 - CO2 - Instrumental	Co2
Method 5 - Particulate Matter(PM)	Filterable Particulate
Method 5B - PM Nonsulfuric Acid (Particulate Matter)	Nonsulfuric Acid PM
Method 5F - PM Fluid Catalytic Cracking Unit	Nonsulfate PM
Method 5/202 - Combination of Methods 5 and 202	Filterable Particulate
Method 5/202 - Combination of Methods 5 and 202	Inorganic (Aqueous) Condensable Part.
Method 5/202 - Combination of Methods 5 and 202	Organic Condensable Particulate
Method 5/202 - Combination of Methods 5 and 202	Total Particulate
Method 6C - SO2 - Instrumental.	Sulfur Dioxide
Method 7E - NOx - Instrumental.	Nitrogen oxides (NOx)
Method 8 - Sulfuric Acid Mist	Sulfuric Acid Mist
Method 8 - Sulfuric Acid Mist	Sulfuric Acid Mist (incl. SO3)
Method 8 - Sulfuric Acid Mist	Sulfur Trioxide as H2SO4
Method 8 - Sulfuric Acid Mist	Sulfur Trioxide
Method 8 - Sulfuric Acid Mist	Sulfur Dioxide
Method 10 - Carbon Monoxide-NDIR.	Carbon Monoxide
Method 12 - Inorganic Lead	Inorganic Lead
Method 13A - Total Fluoride (SPADNS Zirconium Lake)	Total Fluoride
Method 13B - Total Fluoride (Specific Ion Electrode)	Total Fluoride
Method 17 - In-Stack Particulate (PM)	Filterable Particulate
Method 17/202 - Combination of Methods 17 and 202	Organic Condensable Particulate
Method 17/202 - Combination of Methods 17 and 202	Inorganic (Aqueous) Condensable Part.
Method 17/202 - Combination of Methods 17 and 202	Filterable Particulate
Method 23 - Dioxin and Furan (02/91 FR Copy).	2,3,7,8-TCDD
Method 23 - Dioxin and Furan (02/91 FR Copy).	1,2,3,7,8-PeCDD
Method 23 - Dioxin and Furan (02/91 FR Copy).	1,2,3,4,7,8-HxCDD

Frequently Asked Questions About the ERT

This page provides answers to frequently asked questions about the Electronic Reporting Tool (ERT). Click on a question below to view answers relating to your selection. Links throughout the answers will guide you to further information on our web site. Should you have any further questions or comments, please contact Ron Myers by sending an email to myers.ron@epa.gov.

1. [How can I get the ERT to run on my computer?](#)
2. [Is there a way I can stop the ERT security warnings?](#)
3. [Are the ERT calculations correct for the Volume of Water Vapor Collected and for the Dry Gas Meter Volume? I get a different value when I use the EPA Method 5 calculations for those parameters.](#)
4. [How do I submit my files electronically to EPA?](#)
5. [How do I submit my files to EPA if I can't use the ERT program? \(For instance, the test data includes methods not supported by the ERT\).](#)
6. [How do I submit my ERT files to EPA if the data includes confidential business information \(CBI\)?](#)
7. [My CDX registration has been approved, and my ERT files are in the correct format. I keep getting the message that my submission to CEDRI was not successful. Why is this?](#)
8. [I am already registered to submit TRI-ME \(or TSCA, RCRA, CEDRI etc.\) data through EPA's CDX. Can I extend my authorization to other data systems?](#)

1. **How can I get the ERT to run on my computer?**

Verify you have a version of Microsoft Access® that will run the ERT.

If you have Microsoft Access version 2007:

- Verify that you have at least Service Pack 2 installed.
 - Open Microsoft Access, click on the MS circle in the upper left corner of the Access window,
 - Click on "Access Options" at the bottom of the window,
 - Click on "Resources" in the left column.
 - At the bottom of the window just below the text "about Microsoft Office Access 2007" the software (Microsoft Office Access 2007) and the Service Pack level is identified. If Service Pack 2 is installed, the text "SP2 MSO" will be between two sets of numbers that are in parentheses.
 - If you do not have Service Pack 2 installed, click on "Check for Updates" and follow the directions to install the updates from Microsoft. Many corporate computers do not allow users to install software and you will need to contact your Information Technology Center for them to update your software.

If you have Microsoft Access version 2010:

- Any Service Pack level is acceptable in order to run the ERT Application.

If you do NOT have Microsoft Access or have an earlier version than 2007:

- You will need to download and install the runtime version of Microsoft Access from the [Microsoft Access Download Center](#). [EXIT Disclaimer](#).
- After installing the runtime version of Microsoft Access, download the ERT ZIP file to your hard drive and extract the manual and the database to a folder. Open the program with MS Access.

[Top of page](#)

2. **Is there a way I can stop the ERT security warnings?**

If you have Microsoft Access 2007, to avoid these warnings every time you run ERT, make the ERT directory and all subdirectories "Trusted Locations".

- To make the ERT directory a Trusted location, close the ERT application, open Microsoft Access,
- Click on the MS circle in the upper left corner of the Access window,
- Click on "Access Options" at the bottom of the window,

CHIEF Home

Emissions Factors
Policy Applications
Center

Basic Information

Emissions Factors /
AP42

Emission Factor &
Estimation Tools

CHIEF Archives

- Click on "Trust Center" in the left column,
- Click on "Trust Center Settings",
- Click on "Trusted Locations",
- Click on "Add new location".
- Browse for the location or directory where you saved the ERT application (the file ERT4.accdb). Select this location and click on the box to the left of "Subfolders of this location are also trusted" to enable these locations.
- Click on "OK". Verify that the Path that you selected is one of the trusted locations.
- Click "OK" to close the Trust Center window then the Access Options window.
- Close Access. Reopen the ERT application.

⤴ Top of page

3. ***Are the ERT calculations correct for the Volume of Water Vapor Collected and for the Dry Gas Meter Volume? I get a different value when I use the EPA Method 5 calculations for those parameters.***

Neither the ERT nor your calculations are incorrect.

In [EPA Method 5](#), options are available in the equations for calculating the volume of gas sample measured by the dry gas meter, corrected to standard conditions ($V_{m(std)}$) and the equation for calculating the volume of water vapor in the gas sample, corrected to standard conditions ($V_{w(std)}$).

In both instances, there are two equations presented in Method 5 for each calculation. The first equation presented in Section 12.3 and 12.4 are ones which present the variables associated with the sampling equipment and test conditions and constants for standard conditions and gas characteristics. The values for these constants are presented in Section 12.1 but are rounded to four significant figures.

The second equation presented in these sections of Method 5 use a single calculated value (K1 and K2) replacing all these constants. The calculation uses four to five significant digits and then rounds the result to four significant figures. When K1 and K2 are calculated with all the constants rounded to four significant figures and the resulting value rounded to four significant figures, the result is a different value than the K1 and K2 presented in Method 5.

The ERT calculations use the procedures used to generate the second equations. Since the ERT allows for different standard temperatures and pressures to accommodate State and local agency rules, the values used are the values used to calculate the K1 and K2 in the method. Prior to rounding, these values may differ at the third to fifth significant digit. But when the policy to round the final results to two significant digits is followed there is no difference. For emissions limits expressed to three significant digits, the values using the published K1 and K2 do not introduce calculation errors due to multiple rounding.

⤴ Top of page

4. ***How do I submit my files electronically to EPA?***

- You must first register with the CDX. [See the CDX webpage for registration instructions.](#)
- Only files generated by the ERT program can be submitted electronically to EPA via the CDX.
- Detailed instructions for uploading ERT files are included in the [CDX/CEDRI Guide](#) and on the CEDRI submission webpage.
- The ERT Submission File will be in the format of a Zip file. This Zip file contains two files: one Zip and one XML file. Your file must be in the proper format for a successful submittal. Please do not change the file name that was generated by the ERT software.

5. ***How do I submit my files to EPA if I can't use ERT files? (For instance, the test data includes methods not supported by the ERT).***

Only data collected using the test methods listed on the [ERT website \(http://www.epa.gov/ttn/chief/ert/ert_info.html\)](http://www.epa.gov/ttn/chief/ert/ert_info.html) should be submitted electronically to WebFIRE. If you have used non ERT supported test methods, data should be submitted as described by your state/local agency.

6. ***How do I submit my ERT files to EPA if the data includes confidential business information (CBI)?***

Sources who claim that some of the information being submitted in their performance tests is confidential business information (CBI) must mail a completed ERT file including the CBI on a compact disk or other commonly used electronic storage media clearly marked as CBI to U.S. EPA/OAPQS/CORE CBI Office, Attention: WebFIRE Administrator, MD C404-02, 4930 Old Page Rd., Durham, NC 27703. In addition, the same ERT file with the CBI omitted must be submitted to EPA via CDX.

7. ***My CDX registration has been approved, and my ERT files are in the correct format. I keep getting the message that my submission to CEDRI was not successful. Why is this?***

Recently the CDX Help Desk verified that this is happening because of the java cache on the user's desktop. Complete instructions for clearing the cache can be found on page 2 of [the CDX\CEDRI user Guide](#). (PDF, 81pp 4M).

8. ***I am already registered to submit TRI -ME (or TSCA, RCRA, CEDRI etc.) data through EPA's CDX. Can I extend my authorization to other data systems?***

At present, three CDX data flows support Electronic Signature Agreement (ESA) reuse functionality: CEDRI, TSCA, and TRI. CEDRI users can re-use TSCA's ESAs – this is already in place and doesn't require any changes on the CDX side. A TSCA user can simply add a CEDRI dataflow to their dataflow list and electronically sign their ESA without a need to go through LexisNexis or paper validation process.

However, CEDRI users cannot reuse TRI's ESAs, because TRI's identity proofing threshold is set at a lower level than that of CEDRI's. CEDRI requires a wet ink signature and a phone call, whereas TRI only requires a wet ink signature. Due to these slightly more stringent requirements, CEDRI users cannot re-use TRI's ESAs.

eGGRT dataflow doesn't currently support ESA reuse, so eGGRT users that register for CEDRI will have to go through standard identity proofing process prior to getting access.
