

Dear AQS User,

This morning (February 4, 2010) before 7:00 AM, a software modification was added to AQSPROD.

The modification involved two changes in the processing to create/update monitors:

1. The "Required Collection Frequency" (RCF) is now mandatory for the new lead parameters 14129 and 85129. Without this information, the monitor record will remain at status = "F". When creating a monitor for one of these parameters with Load, if the RCF information is missing, a "Warning" message will appear in the job status (if this is the only problem) and a warning message will appear in the email summary for the load process. In Maintain Monitor, the monitor record will remain at status = "F" until the RCF is added.
2. The process is now in production to allow monitors to be designated as "NCORE". The process limits the designation to "NCORE" to headquarters users with the appropriate security role. This designation will be updated when requested by the Ambient Air Monitoring Group after the individual monitors are operational.

Please contact me if there are any problems with this new processing.
