AQS Users -

Fixes were deployed last night for the following:

1) When the Raw Data Summary Report was run from the batch screen after a POST, the report showed that duplicate PM2.5 data records had been created. No duplicate records were actually created. It was a just a "join" problem on the report, and this has been fixed.

2) In Standard Reports, an error could occur when running a report that had the Applicable Standards field. For the report, the user selected the geographic selection and the parameter, and then moved to "Report Options." If the user moved back to "Monitor Selection" to change the parameter, then the "Applicable Standards" field was not being repopulated with the correct parameter information.

This has been fixed.

3) AMP450NC report was not reporting ozone 1-hour summaries.

This has been fixed.

4) AMP255 now correctly shows the number of flow rate verification audits, and the confidence limits for semi-annual flow rate audits.

5) AMP355 was not presenting the quarterly and annual statistics according to the event exclusion option selected (i.e., "Events Included" or "Events Excluded" or "Events with Regional Office Concurrence Excluded.")

This has been fixed.

6) AMP470 was not supporting the Tribal Mode, and the report was not providing monitor information with the Tribal code.

This has been fixed.
