

# Transportation Greenhouse Gas Emissions 1990 – 2003: Trends, Uncertainties and Methodological Improvements

John Davies

Transportation and Climate Division

Office of Transportation and Air Quality

May 18, 2006

# Overview

---

- **Characterize the magnitude of growth in transportation GHG emissions, based on data from EPA *Inventory of U.S. Greenhouse Gas Emissions and Sinks***
- **Discuss factors affecting the rise in transportation GHGs**
- **Sources of uncertainty in the *Inventory* transportation estimates**
- **Recent methodological improvements**

# *Inventory of U.S. GHG Emissions and Sinks – Institutional Responsibilities*

---

- **Prepared annually by EPA under United Nations Framework Convention on Climate Change (UNFCCC)**
- **Coordinated by EPA Office of Atmospheric Programs (OAP)**
- **Includes transportation estimates developed by EPA Office of Transportation and Air Quality (OTAQ)**
- **Relies extensively on data provided by the Energy Information Administration (EIA) of the U.S. Department of Energy**

# *Inventory of GHG Emissions and Sinks – Document Organization*

---

- **GHG data are oriented around specific gases (CO<sub>2</sub>, CH<sub>4</sub>, N<sub>2</sub>O, HFCs)**
  - UNFCCC guidelines also require presentation of GHG data by broad categories (fossil fuel combustion, non-energy use of fuel, etc.)
  - Primary value to climate specialists
- **EPA disaggregates estimates by economic sector, relying heavily on EIA estimates for CO<sub>2</sub> emissions**
- **OTAQ further disaggregates transportation GHG estimates by mode (passenger cars, light-duty trucks, heavy-duty trucks, aircraft, rail, ships/boats)**
- **OTAQ also generates bottom-up estimates of CH<sub>4</sub> and N<sub>2</sub>O**

# *Inventory estimates of Transportation GHGs*

---

## **Includes**

- Tailpipe emissions (from use of energy to power vehicles)
- HFCs from mobile air conditioners

## **Does not include**

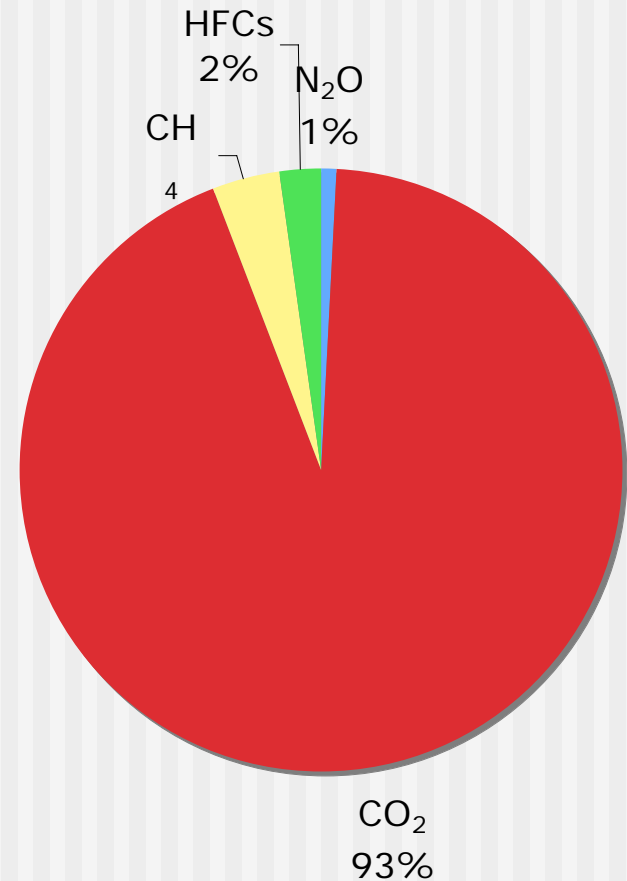

- Ozone-depleting substances, which are not counted in national totals
- Agriculture and construction equipment (generally represented in the industrial sector)
- International bunker fuels
- Lifecycle GHGs

# U.S. GHG Emissions by Gas (Weighted by Global Warming Potential)

## Transportation

## All Sources

# Stand-alone OTAQ Transportation GHG Report

- Released by OTAQ in March 2006 as a complement to the *GHG Inventory*
- Provides context for transportation GHGs
  - Lifecycle GHG estimates
  - Factors affecting emissions
  - Emerging issues

Available at

## Greenhouse Gas Emissions from the U.S. Transportation Sector 1990–2003

Office of Transportation and Air Quality (6401A)  
EPA 420-R-06-003  
March 2006  
[www.epa.gov](http://www.epa.gov)

# Change in U.S. GHG Emissions by End-Use Economic Sector, 1990-2003

# U.S. GHG Emissions by End-Use Economic Sector, 1990-2003

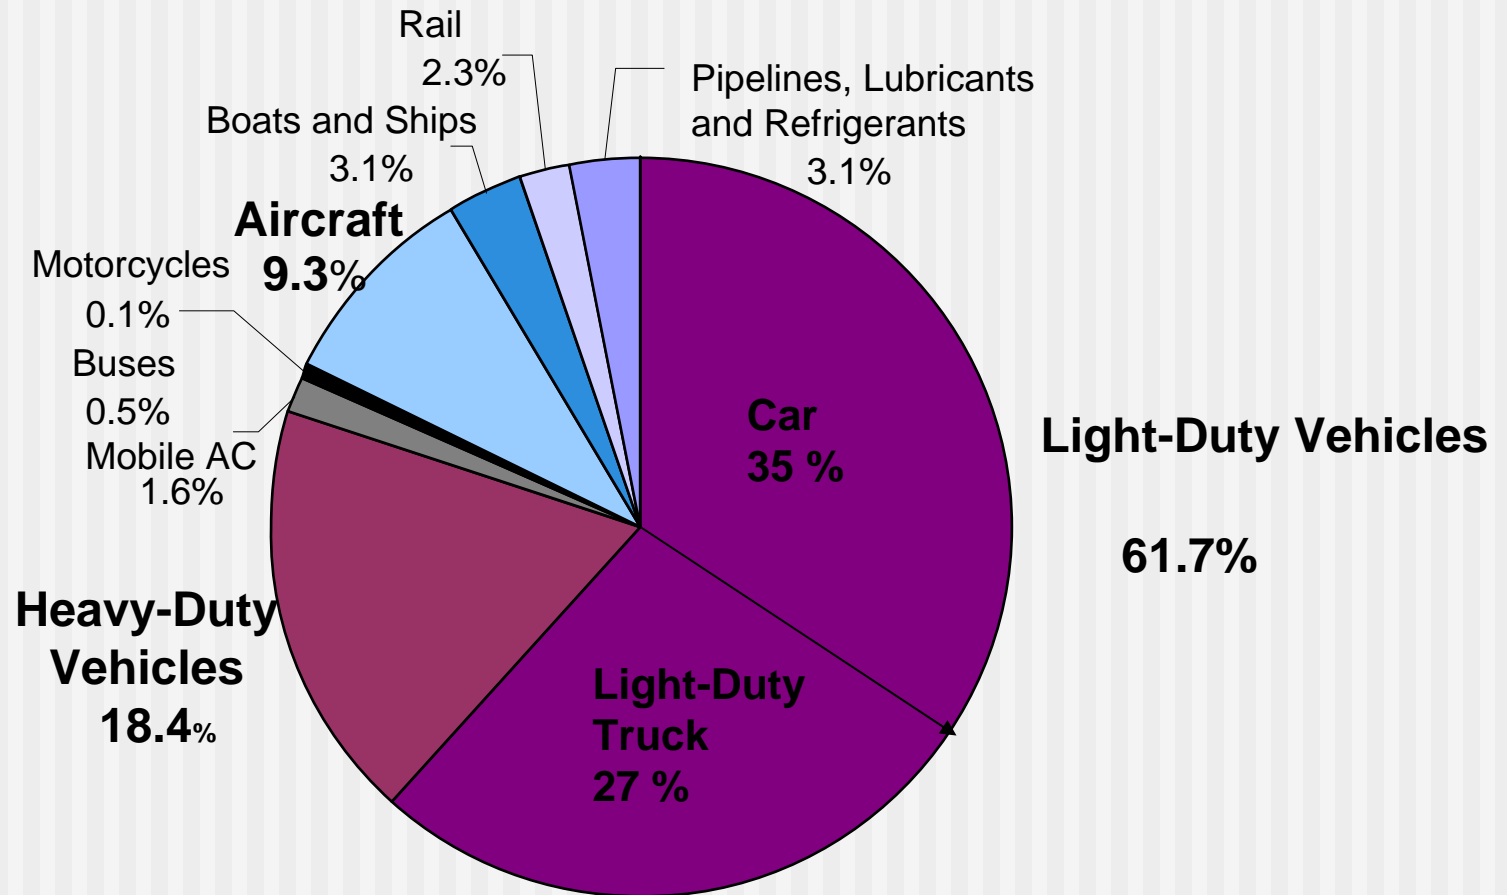

**Transportation  
GHGs up 24 percent**

**Non-transportation  
sectors cumulatively  
up 9.5 percent**

**Transportation  
accounted for over  
27 percent of U.S.  
GHG emissions in  
2003**

# Sources of U.S. Transportation GHG Emissions

# Growth in Transportation GHGs by Source, 1990-2003

---

| Source                     | Change in GHGs |
|----------------------------|----------------|
| <b>Light-Duty Vehicles</b> | <b>+19 %</b>   |
| Passenger Cars             | + 2%           |
| Light-Duty Trucks          | + 51%          |
| <b>Heavy-Duty Vehicles</b> | <b>+57%</b>    |
| <b>Aircraft</b>            | <b>-3%</b>     |
| Commercial Aircraft        | +4.8%          |

# Transportation GHG Emissions by Source, 1990-2003

# GHG Growth by Source:

## Impact of Activity and Vehicle Energy Efficiency

| Source              | Change in Activity | Change in Energy Efficiency  | Change in GHGs |
|---------------------|--------------------|--|----------------|
| Light-Duty Vehicles | +34%               | Small increase in overall fuel economy- but <i>new</i> vehicle fuel economy has been declining | +19 %          |
| Heavy-Duty Vehicles | +48%               | Virtually unchanged  | +57%           |
| Commercial Aircraft | +48%               | Significant improvement: aircraft becoming more fuel efficient, and greater passenger loads    | 4.8%           |

# Passenger versus Freight GHGs, 1990-2003

---

| Source    | Change in Activity | Change in GHGs |
|-----------|--------------------|----------------|
| Passenger | ~36 % increase     | +20 %          |
| Freight   | ~42 % increase     | +46%           |

# Freight GHGs by Source, 1990 and 2003

# Estimating CO<sub>2</sub>

## Traditional Approach and Uncertainty

---

- Have traditionally used EIA's "top-down" estimates of fuel consumption by economic sector
- Multiply by carbon content of fuel and adjusting for carbon that does not oxidize during combustion (UNFCCC values)
- OTAQ allocates CO<sub>2</sub> to specific modes using "bottom-up" fuel consumption and activity
  - FHWA *Highway Statistics*
  - Oak Ridge National Laboratories *Transportation Energy Data Book*
- Inconsistencies between the top-down and bottom-up data

# Comparison of EIA and Bottom-Up Fuel Consumption Estimates

| Fuel Type/Vehicle Type    | 2003 Inventory Est. | 2003 Bottom-Up Est. | Difference   | Percent Difference |
|---------------------------|---------------------|---------------------|--------------|--------------------|
| <b>Gasoline</b>           | <b>1,143.70</b>     | <b>1,153.90</b>     | <b>10.2</b>  | <b>0.89%</b>       |
| Automobiles               | 630.2               | 635.8               | 5.6          | 0.89%              |
| Light-Duty Trucks         | 460.9               | 465                 | 4.1          | 0.89%              |
| Heavy-Duty Trucks         | 39.6                | 39.9                | 0.3          | 0.76%              |
| Buses                     | 0.3                 | 0.3                 | 0            | 0                  |
| Motorcycles               | 1.6                 | 1.6                 | 0            | 0                  |
| Boats (Recreational)      | 11                  | 11.1                | 0.1          | 0.91%              |
| <b>Diesel Fuel</b>        | <b>386.6</b>        | <b>417</b>          | <b>30.4</b>  | <b>7.86%</b>       |
| Automobiles               | 3.4                 | 3.7                 | 0.3          | 8.82%              |
| Light-Duty Trucks         | 17.6                | 19                  | 1.4          | 7.95%              |
| Heavy-Duty Trucks         | 301.1               | 325.5               | 24.4         | 8.10%              |
| Buses                     | 8                   | 8.6                 | 0.6          | 7.50%              |
| Locomotives               | 39.6                | 42.8                | 3.2          | 8.08%              |
| Ships and Boats           | 17                  | 17.4                | 0.4          | 2.35%              |
| <b>Electricity</b>        | <b>3.2</b>          | <b>3.9</b>          | <b>0.7</b>   | <b>21.88%</b>      |
| <b>Jet Fuel</b>           | <b>169</b>          | <b>152.7</b>        | <b>-16.3</b> | <b>-9.64%</b>      |
| Commercial Aircraft       | 122.8               | 122.8               | 0            | 0                  |
| Military Aircraft         | 20.5                | 20.5                | 0            | 0                  |
| General Aviation Aircraft | 9.4                 | 9.4                 | 0            | 0                  |
| Other Aircraft            | 16.3                | -                   |              |                    |

# Comparison of EIA and Bottom-Up Fuel Consumption Estimates

---

- **Interagency Discussion with EIA and FHWA**
- **Determined that EIA was using older FHWA data in its fuel consumption estimates**
- **Recognized that EPA should calculate CO<sub>2</sub> using best available data sources, which include bottom-up data**

# Improvements in the 2006 *Inventory*

---

- **Implemented bottom-up calculation of transportation diesel**
  - **Held constant EIA estimate of total diesel consumption across all sectors**
  - **Non-transportations sectors adjusted downward**
- **Use of an updated oxidation fraction estimate**
  - **2004 EPA study indicated that light-duty gasoline vehicles combust 100 percent of fuel (default assumption was 99 percent)**
  - **Study has been peer reviewed and may be incorporated into IPCC reporting guidelines**

# Planned Improvements for future *Inventory* estimates

---

- **Continue reconciling bottom-up and top-down data used to estimate CO<sub>2</sub>, CH<sub>4</sub> and N<sub>2</sub>O**
- **Investigation of bunker fuel data**
- **Use better VMT data to improve estimates by vehicle / fuel category**
- **Updating CH<sub>4</sub> and N<sub>2</sub>O emissions factors for Tier-2 vehicles**
- **Improve consideration of off-road vehicle use**
