

Emission Inventory Validation and Improvement: A Central California Case Study

Presented by:
Lyle R. Chinkin
Sonoma Technology, Inc.
Petaluma, CA

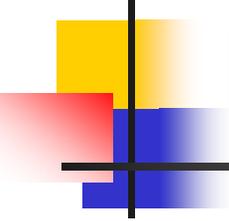

U.S. EPA 16th Annual Emission Inventory
Conference
Raleigh, NC
May 17, 2007

Background (1 of 3)

Emission Inventories:

- Support air quality modeling and regulatory control strategy development
- Are continually being refined and improved
 - New emission factors
 - Updated activity data estimates
 - Improved mobile source models

Background (1 of 3)

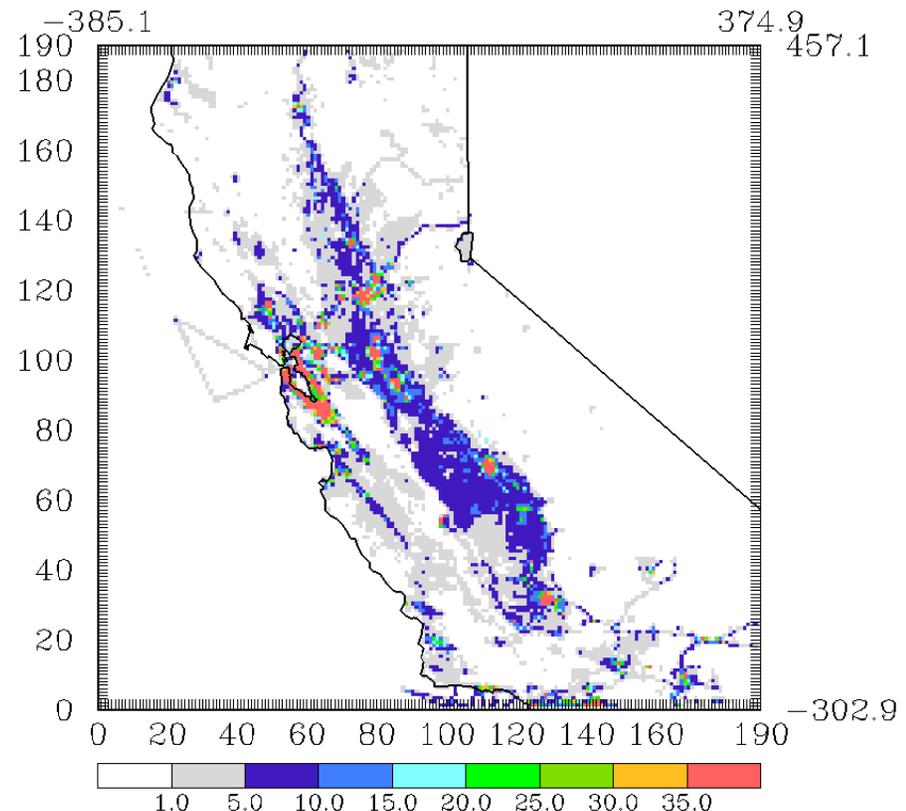

Emission Inventory Validation:

- Sanity check (common sense review)
- Bottom-up evaluations (start with activity data collection)
- Top-down evaluations (compare emission estimates to ambient air quality data)
- Photochemical modeling simulations

Background (3 of 3)

Central California Ozone Study (CCOS):

- Multi-year program of monitoring, EI development, data analysis, and air quality modeling
- CCOS EI refinements
 - EMFAC (on-road model) updates
 - OFFROAD model updates
 - Stationary source revisions
- STI performed emission reconciliation on latest CCOS EI

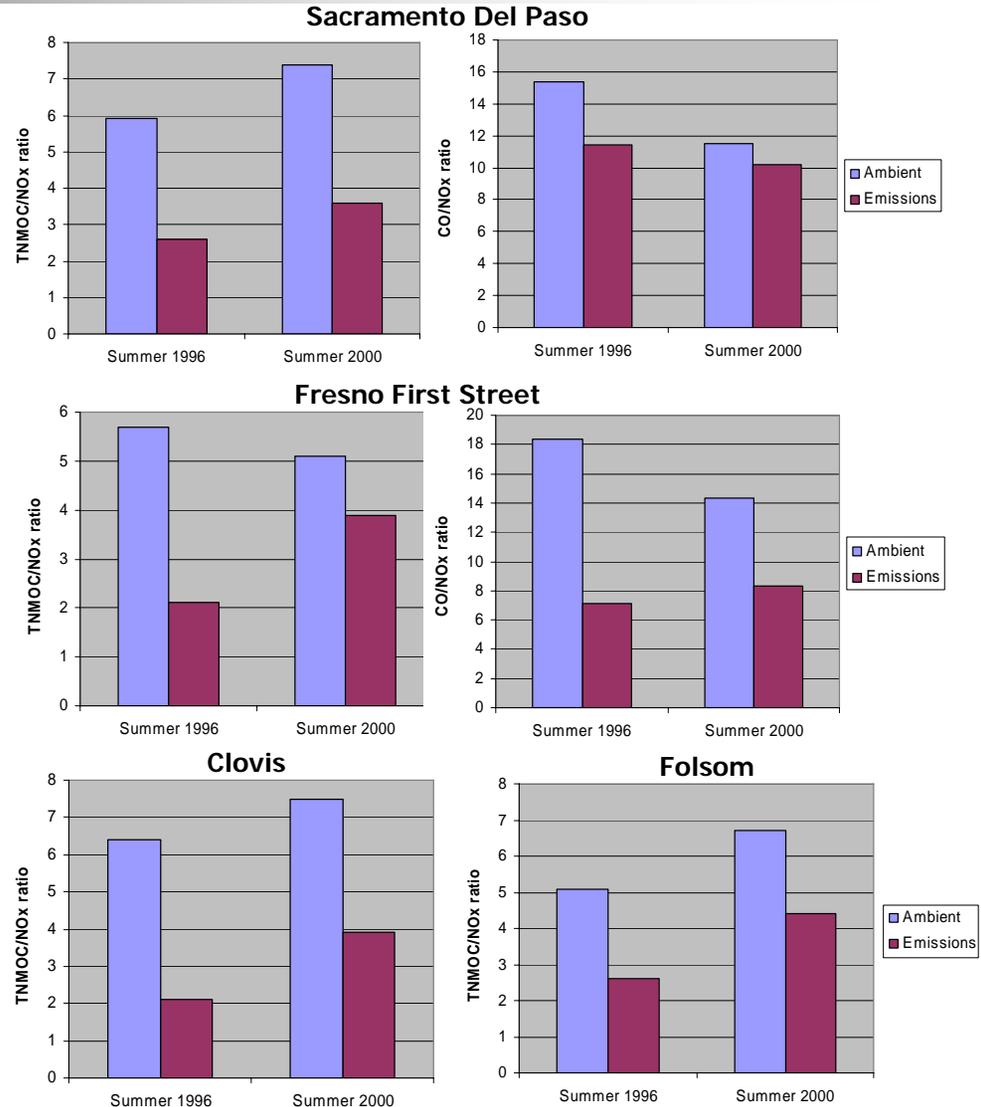

Preview of Findings (1 of 3)

- Overall, the emissions data show better agreement with ambient data than previous emission inventories have.

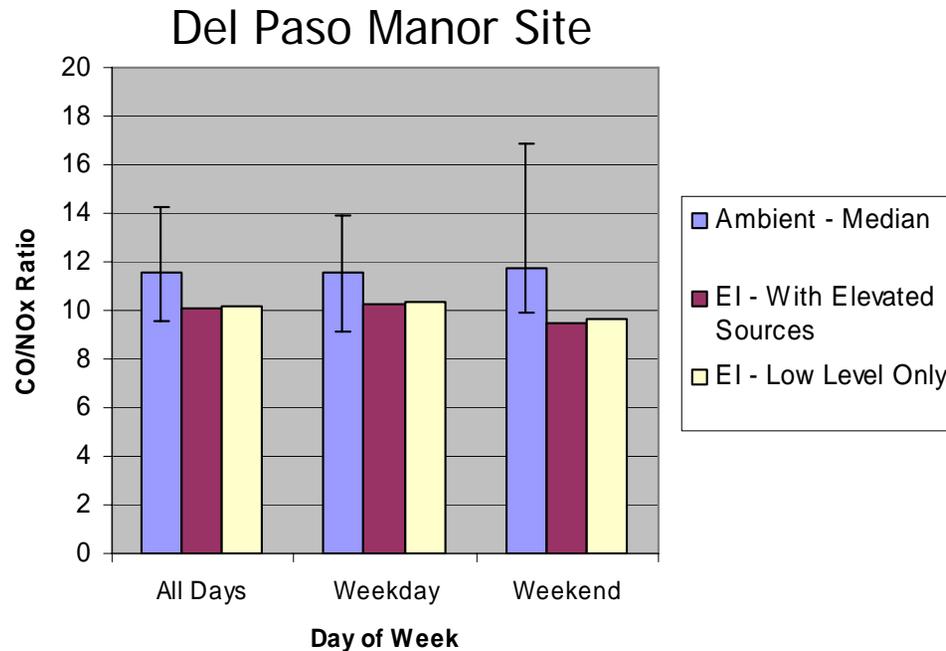

| Air Basin | Ambient ratio/Emissions ratio | | | |
|------------|-------------------------------|----------|----------|-----------|
| | DRI 1990 | DRI 1995 | DRI 2000 | STI 2000* |
| Sacramento | 2.2 | 1.6 | 1.7 | 1.4 - 2.4 |
| Fresno | 3.6 | 2.6 | 1.9 | 1.4 - 7.2 |
| Kern | -- | 3.9 | 2.9 | 2.6 - 4.3 |

*This column shows the range of results from all sites evaluated in each air basin—including both urban and rural sites.

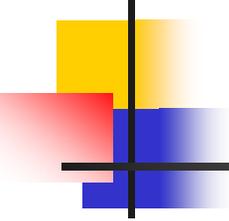

Preview of Findings (2 of 3)

- At some sites, the emissions data correlate with ambient data as closely as could be expected given analyses limitations*.

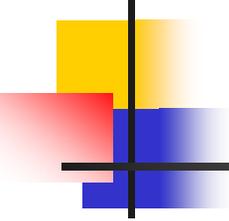

* "ARB staff believes that an assessment such as this should only be expected to produce ambient/emissions ratios that are within approximately +/- 25 to 50% of 1.0." (ARB, 1997)

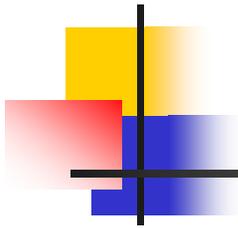

Preview of Findings (3 of 3)

- EI generally under-predicts pollutant ratios
- The EI validation techniques used in this project identified specific issues with the magnitude and spatial/temporal allocation of emissions.

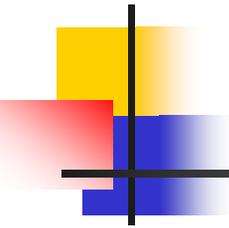

Outline

- Overview of Approach
- Sites Selected
- Results
- Findings and Recommendations
- Questions & Discussion

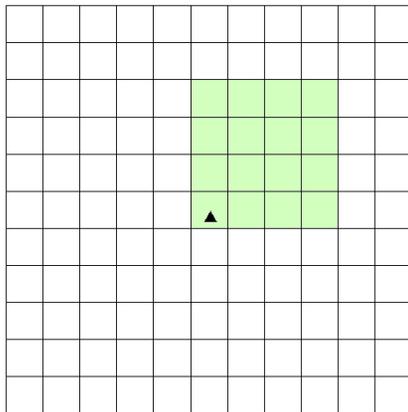

Overview of Approach (1 of 2)

- Comparisons of ambient data to the emission inventory include:
 - TNMOC-to-NO_x ratios
 - CO-to-NO_x ratios
 - Ratios of individual species
 - Chemical composition of hydrocarbons

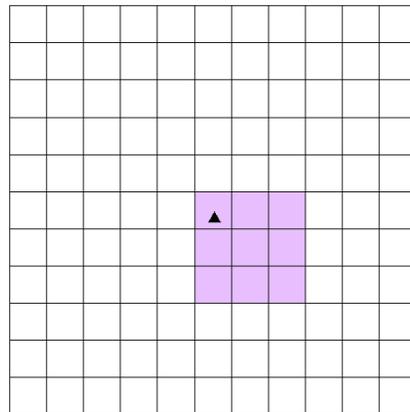

Overview of Approach (2 of 2)

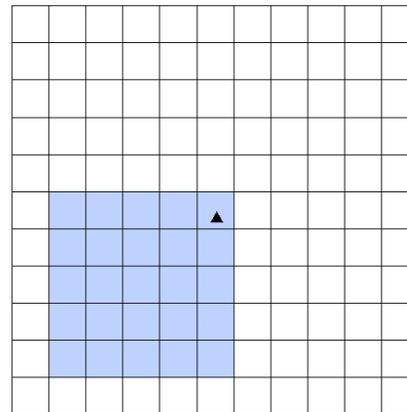

- Spatial and temporal comparisons done by:
 - Weekday vs. weekend
 - Wind quadrants

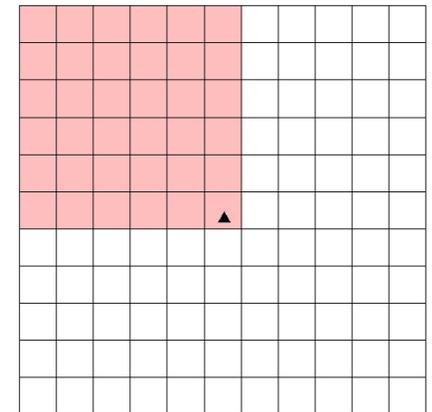

Wind Quadrant 1 (1-90°)

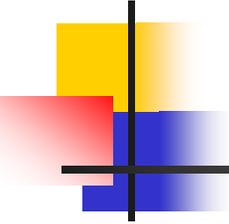

Wind Quadrant 2 (91-180°)

Wind Quadrant 3 (181-270°)

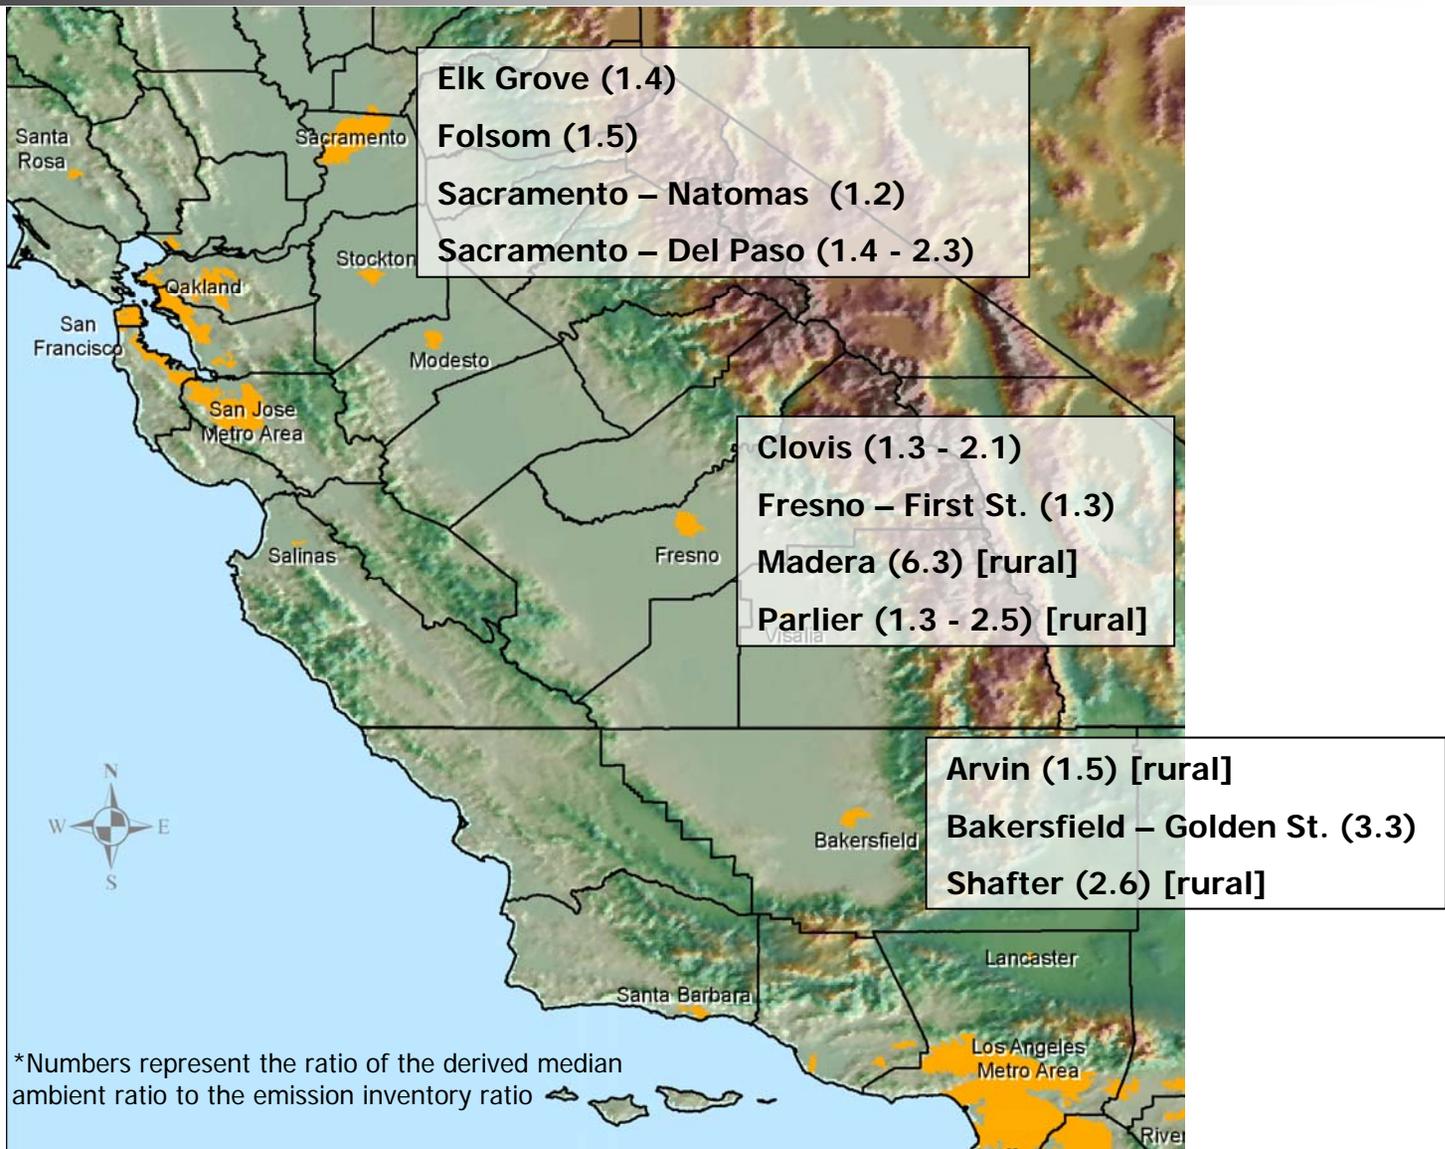

Wind Quadrant 4 (271-360°)

Monitoring Sites Selected

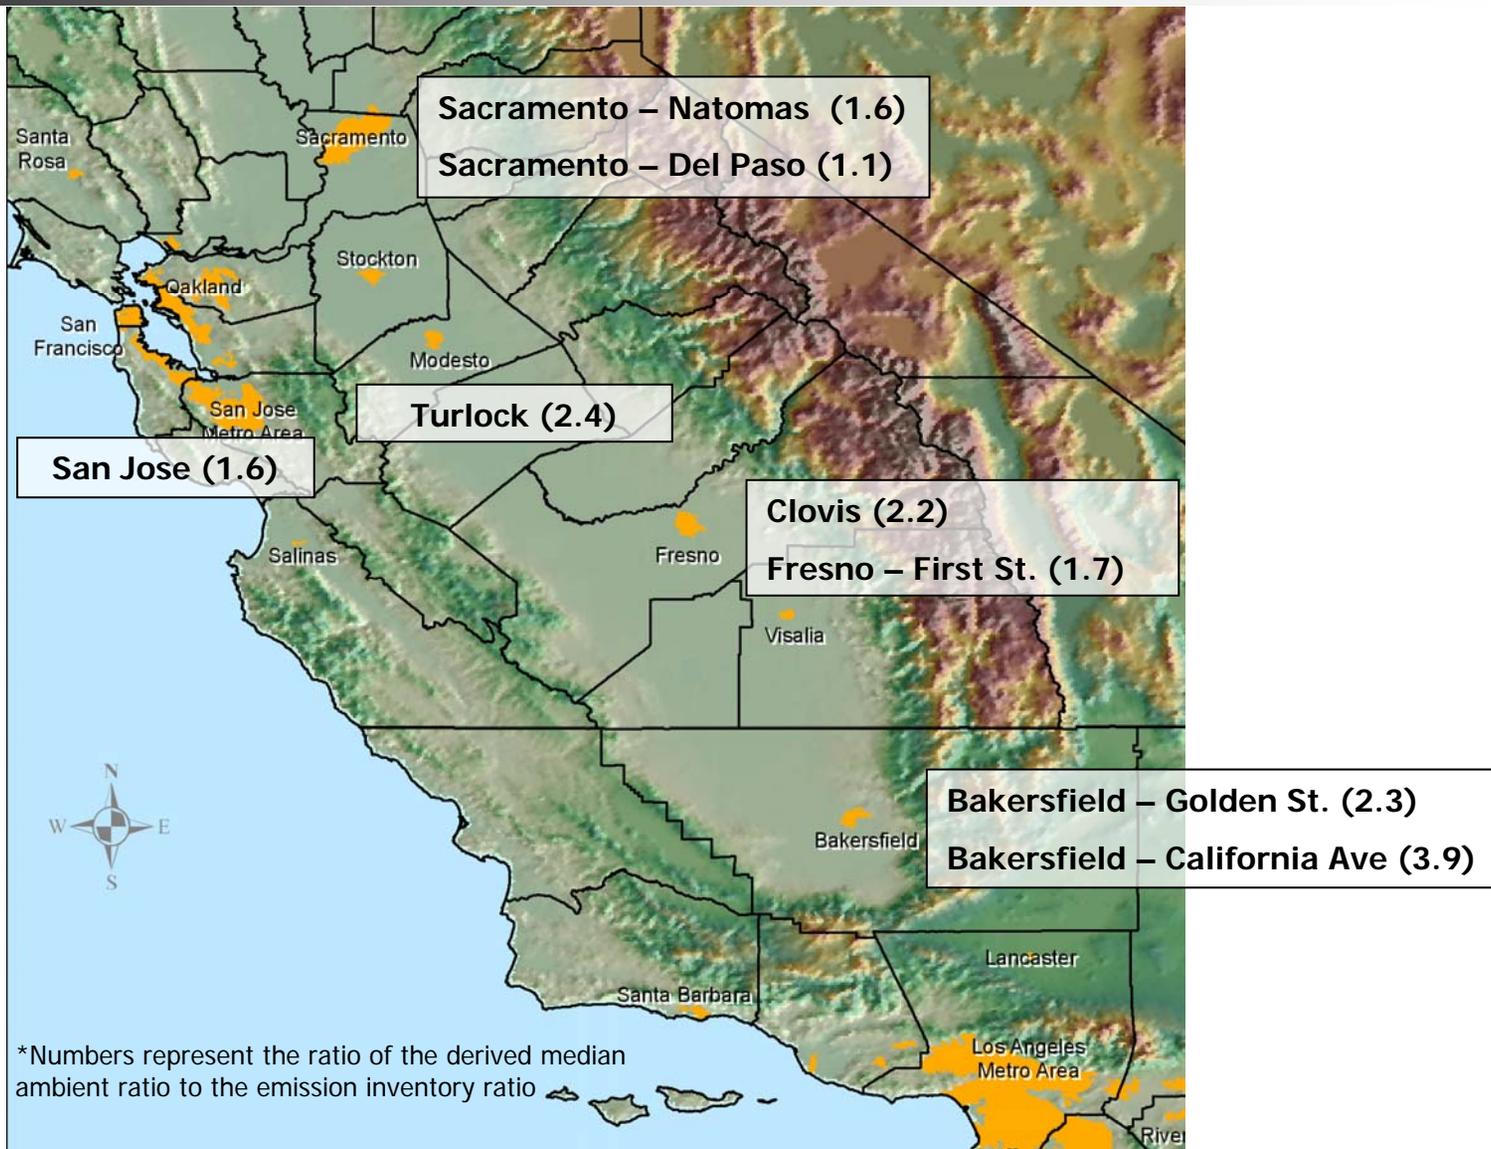

| Site | Tier | District | Site Name | TNMOC/NOx | CO/NOx | Species ratios | VOC fingerprints |
|------|------|----------|-------------------------------------|-----------|--------|----------------|------------------|
| BGS | 1 | SJV | Bakersfield Stn. (Golden State) | X | X | X | X |
| CLO | 1 | SJV | Clovis Stn. | X | X | X | X |
| FSF | 1 | SJV | Fresno Stn. (First St.) | X | X | | |
| NAT | 1 | Sacto | Sacramento/Natomas Stn. | X | X | X | X |
| SDP | 1 | Sacto | Sacramento Stn. (Del Paso Manor) | X | | X | X |
| SUN | 1 | Bay Area | Sunol Stn. | | | X | |
| FLN | 2 | Sacto | Folsom Stn. | X | | X | X |
| PLR | 2 | SJV | Parlier Stn. | X | | X | X |
| ARV | 3 | SJV | Arvin Stn. | X | X | X | X |
| ELK | 3 | Sacto | Elk Grove Stn. | X | | | X |
| M29 | 3 | SJV | Madera Stn. | X | | X | X |
| SHA | 3 | SJV | Shafter Stn. | X | | X | X |
| SJ4 | 3 | Bay Area | San Jose Stn. (4 th St.) | | X | | |
| TSM | 3 | SJV | Turlock Stn. | | X | | |
| BAC | 4 | SJV | Bakersfield Stn. (California Ave.) | | X | | |
| GNBY | 4 | Sacto | Granite Bay Stn. | | | X | |

Comparison of TNMOC/NOx Ratios

*Numbers represent the ratio of the derived median ambient ratio to the emission inventory ratio

Comparison of CO/NOx Ratios

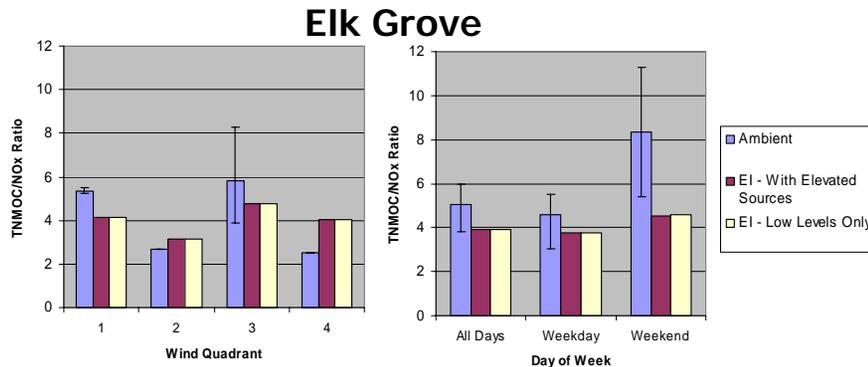

*Numbers represent the ratio of the derived median ambient ratio to the emission inventory ratio

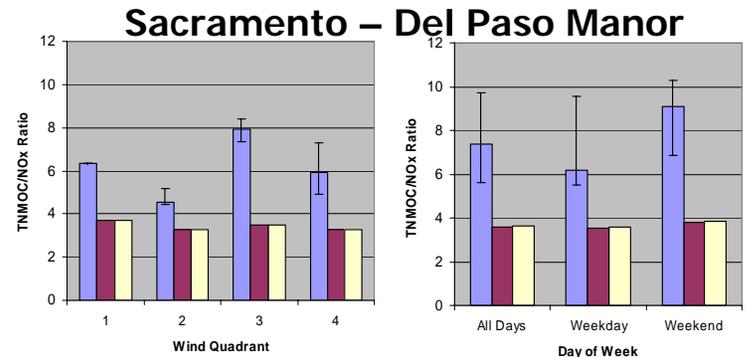

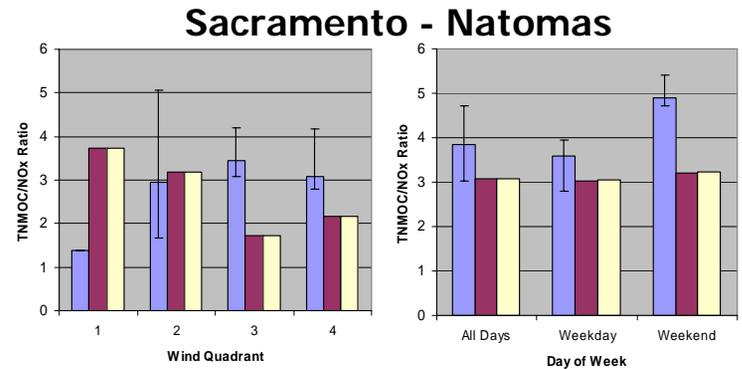

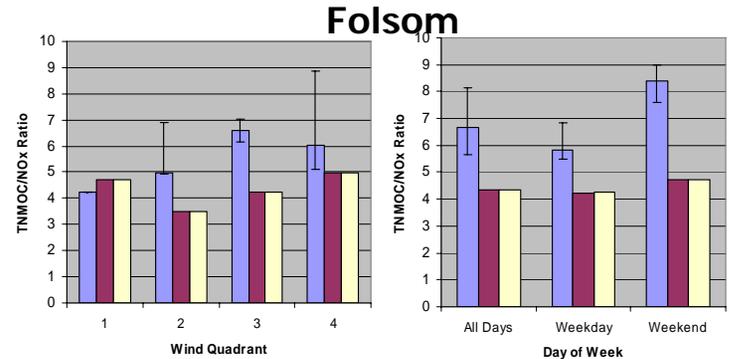

Sacramento Area (1 of 3)

TNMOC/NO_x

- Better agreement on weekdays
- Note poor agreement in wind quadrant 3 at Del Paso Manor

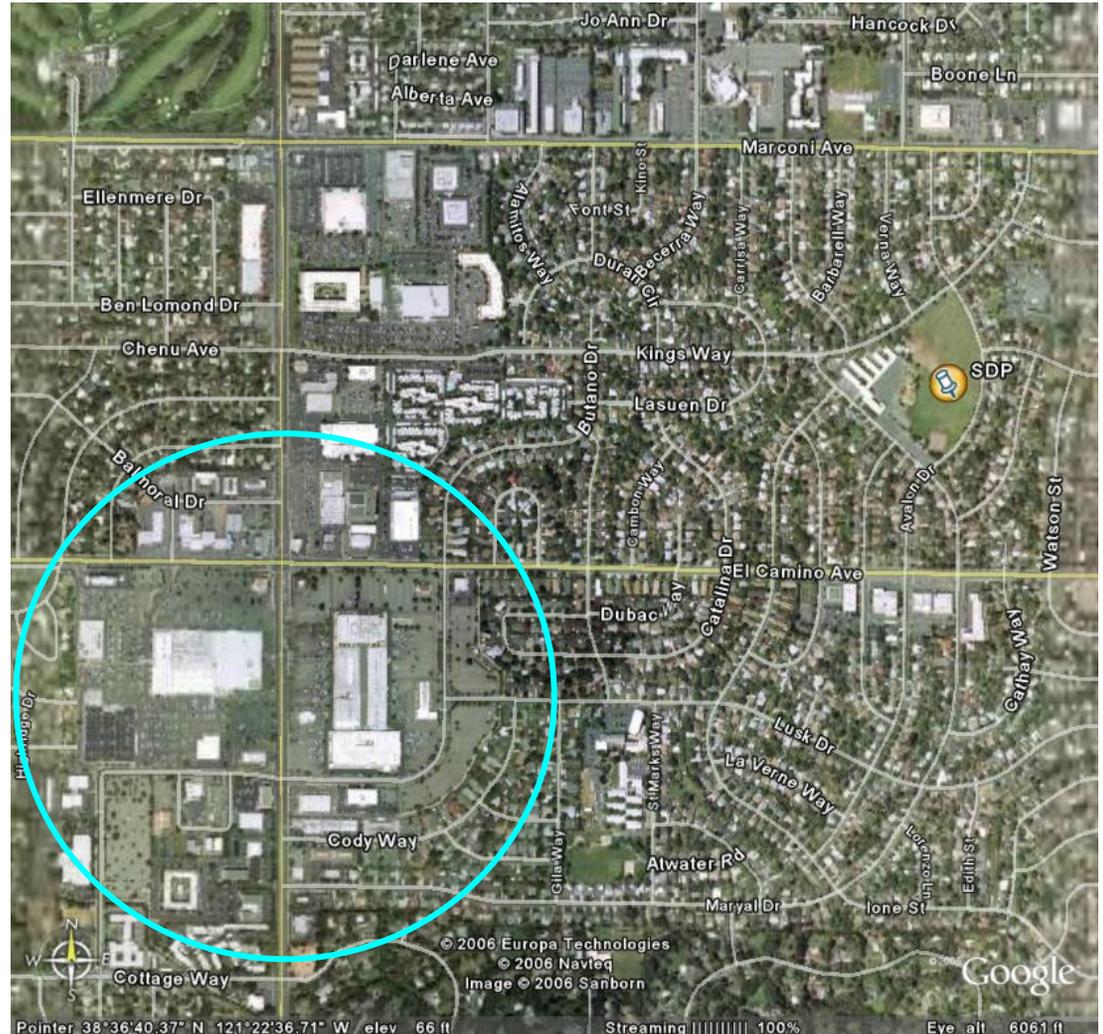

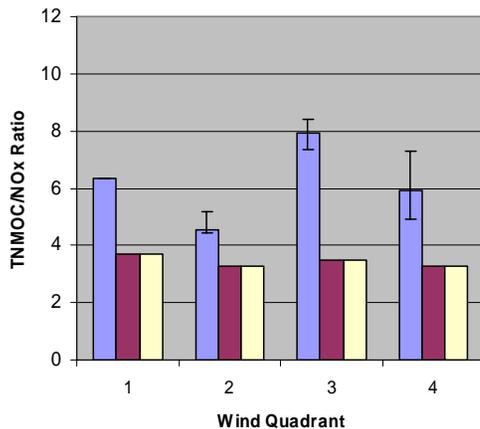

Error bars represent 25th and 75th percentiles

Sacramento (2 of 3)

Del Paso Manor

- Poorest agreement in wind quadrant 3
- Shopping center 1km southwest of site
- Possible issue capturing hot soak emissions in inventory

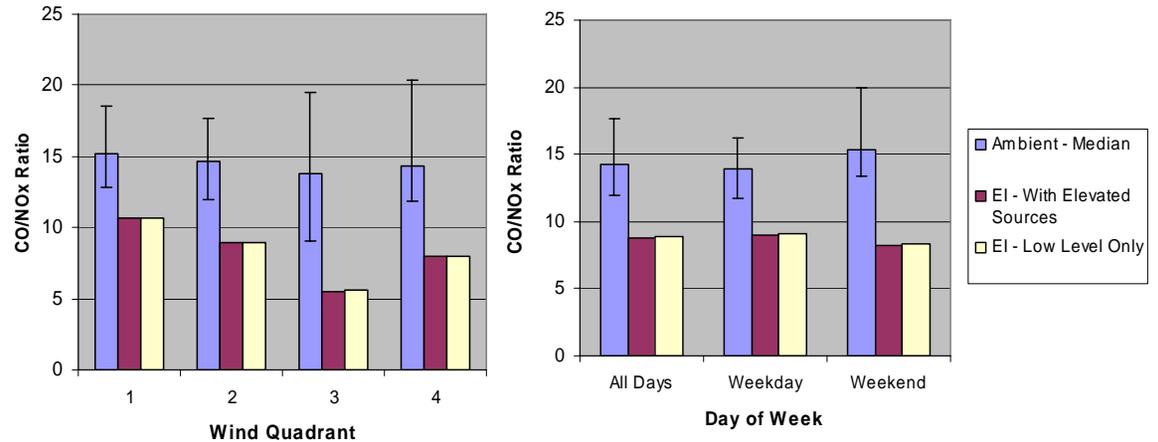

Sacramento Area (3 of 3)

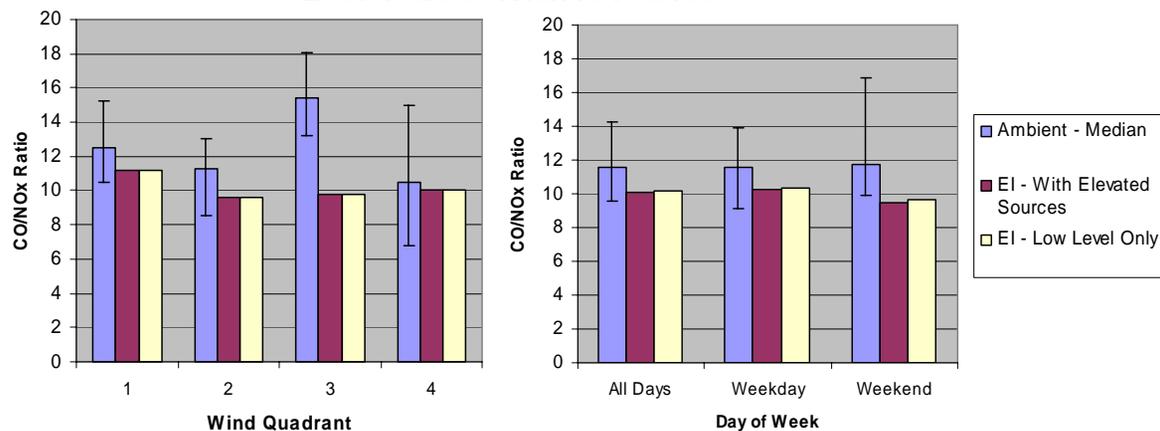

CO/NO_x

- Weekdays and weekends are similar
- Agricultural or heavy duty sources appear to be misrepresented (too high) in Natomas quadrant 3
- Del Paso ratios agree well

Natomas Site

Del Paso Manor Site

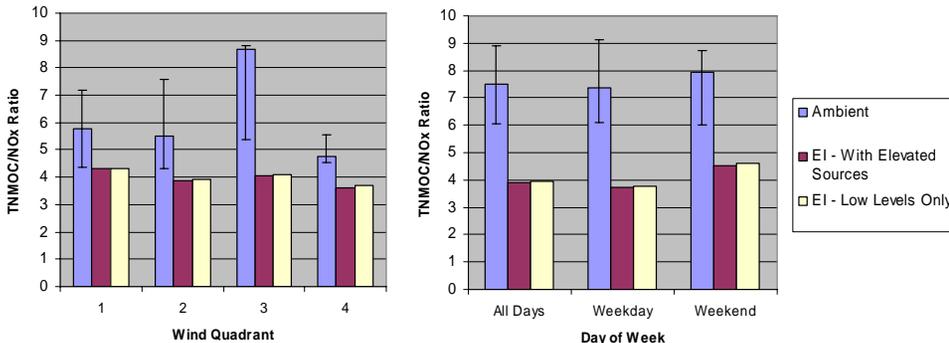

Fresno Area (1 of 2)

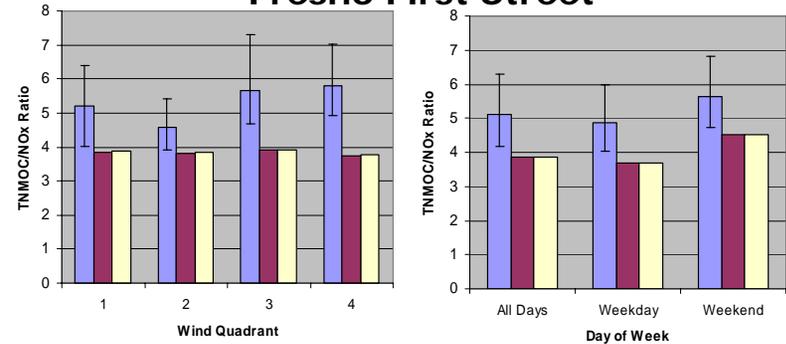

TNMOC/NO_x

- Weekdays and weekends are similar
- Changes in real world growth between Clovis and Fresno compared to surrogates (CLO-quadrant 3)
- Rural Madera site with low emission density (doesn't fully meet assumptions)

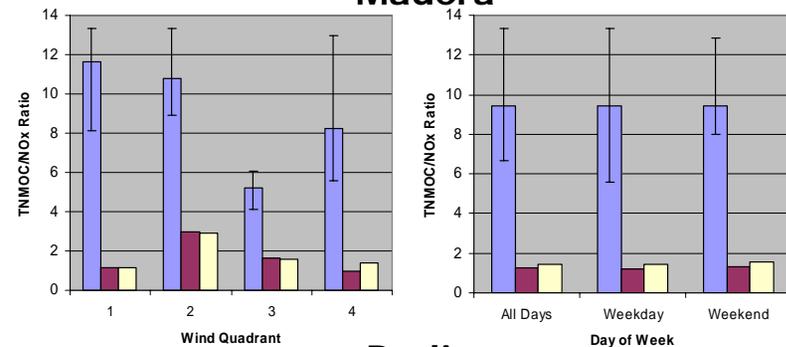

Clovis

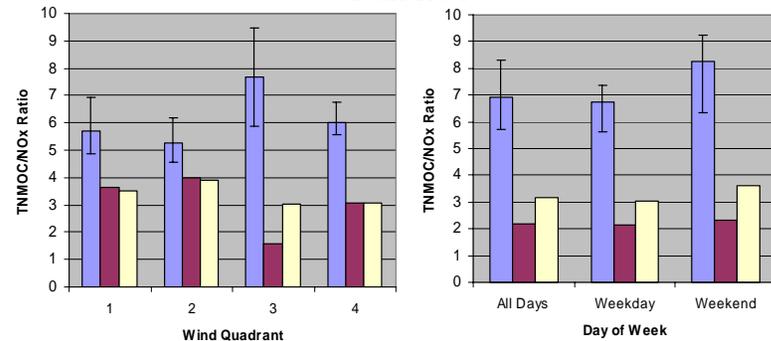

Fresno First Street

Madera

Parlier

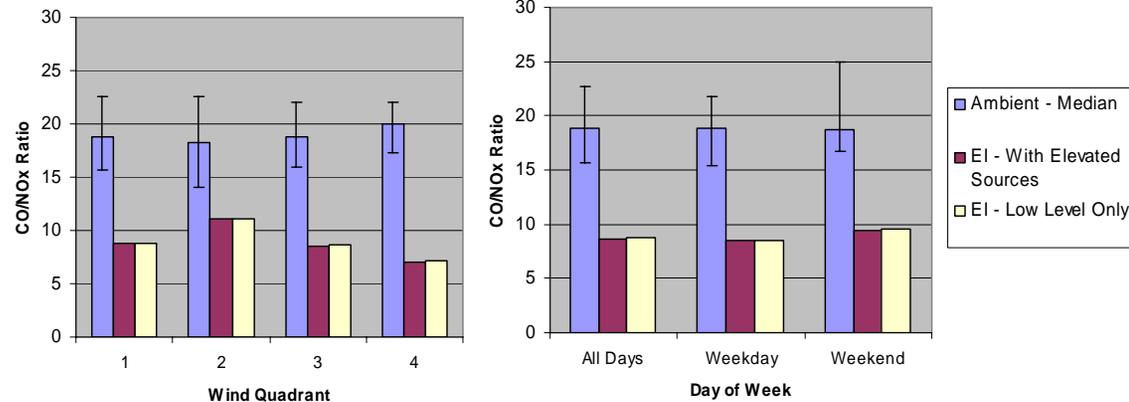

Fresno Area (2 of 2)

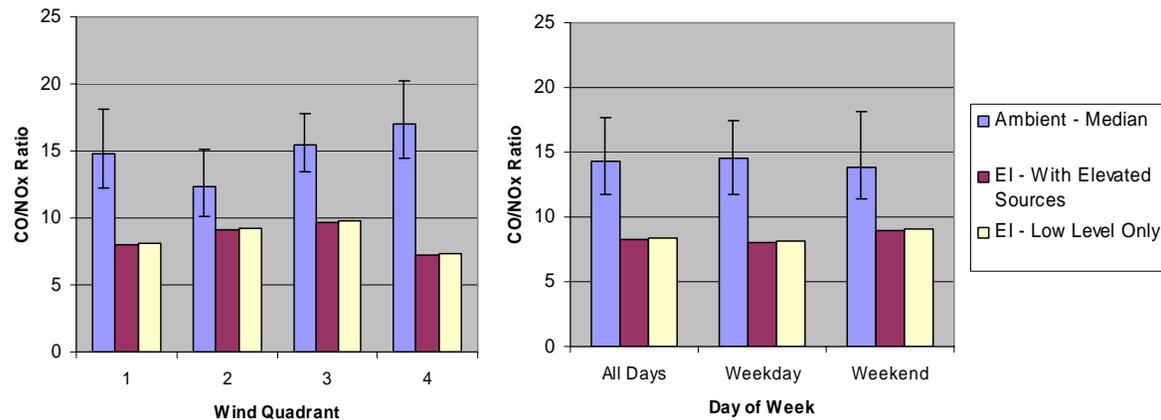

CO/NOx

- Similar agreement on weekdays and weekend days
- Agreements not as good as in the Sacramento area
- May suggest overestimated heavy-duty NOx emissions in the area

Clovis

Fresno First Street

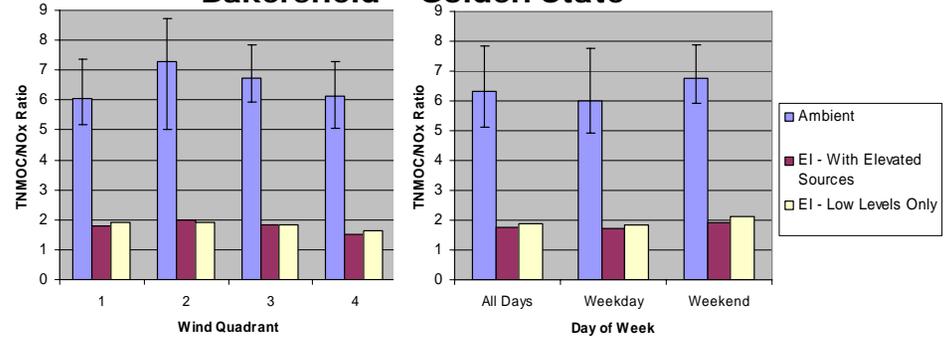

Kern County (1 of 2)

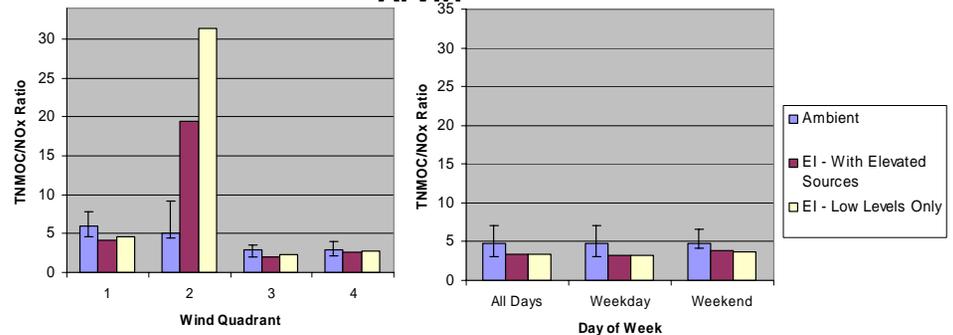

TNMOC/NO_x

- Ambient ratios are 2 to 4 times higher than emissions ratio (Much worse than Sacramento/Fresno)
- Agreement does not vary between weekdays and weekends
- TNMOC emissions in quadrant 2 of Arvin are dominated by biogenics

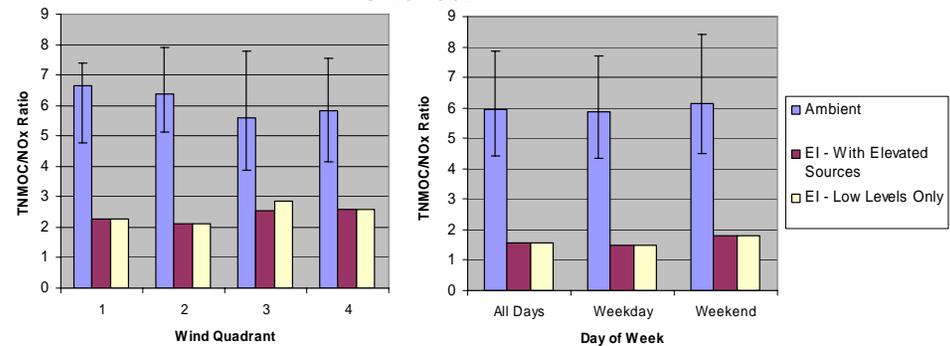

Bakersfield – Golden State

Arvin

Shafter

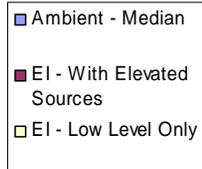

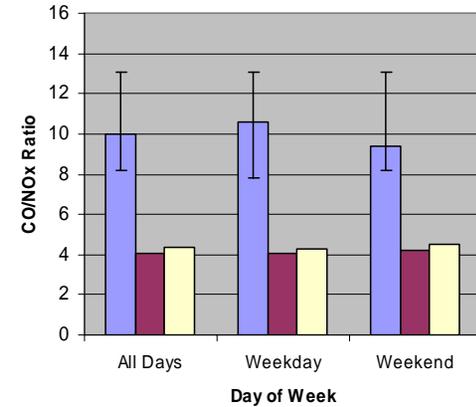

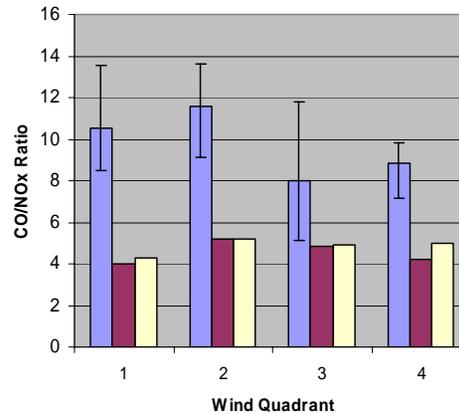

Kern County (2 of 2)

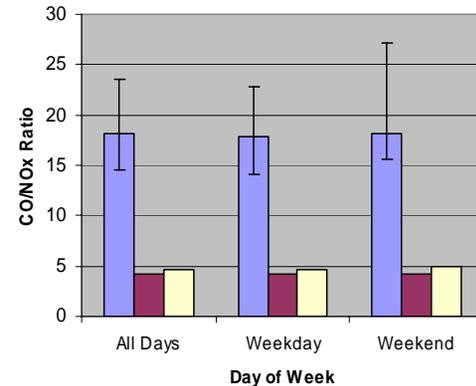

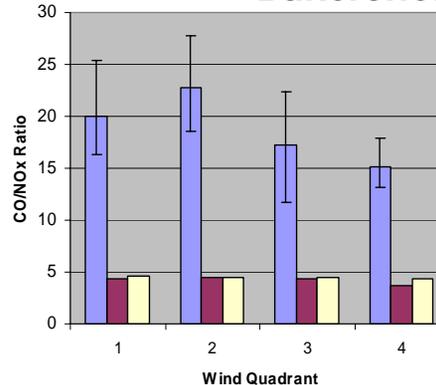

CO/NOx

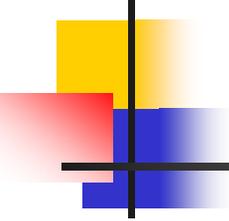

- At Calif. Ave., best agreement in wind quadrants 3 and 4
- Poor overall agreement at the Golden State site

Bakersfield – California Ave.

Bakersfield – Golden State

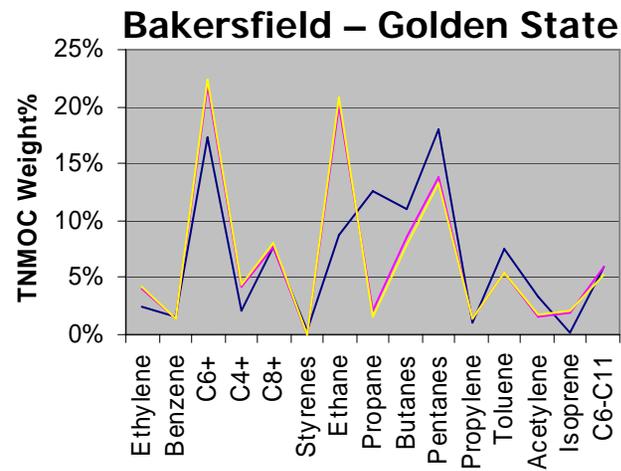

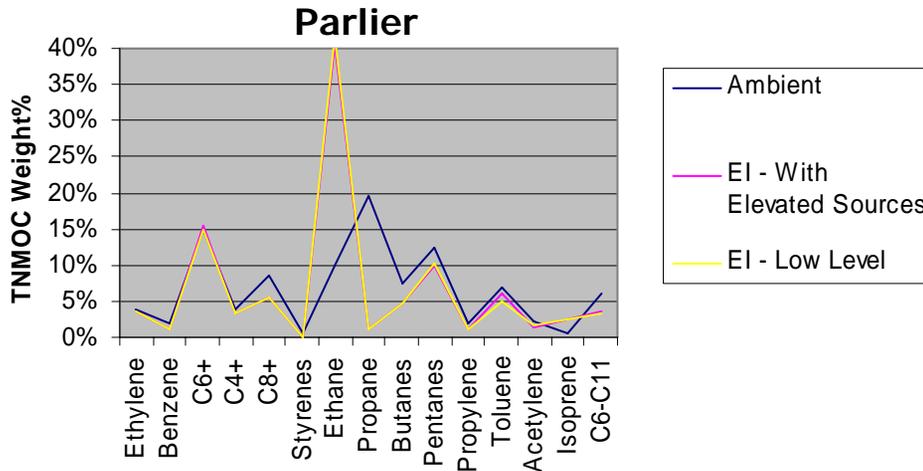

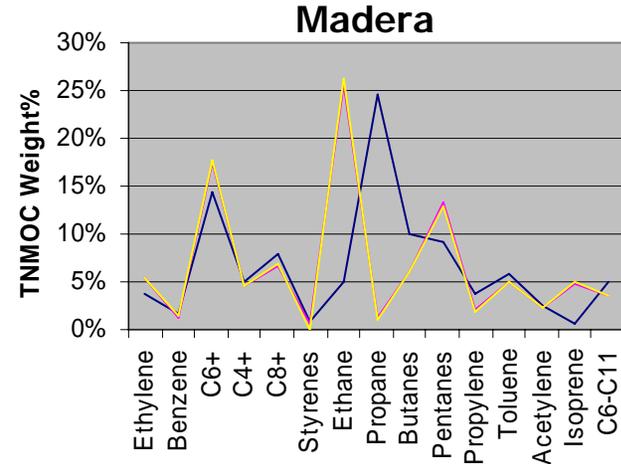

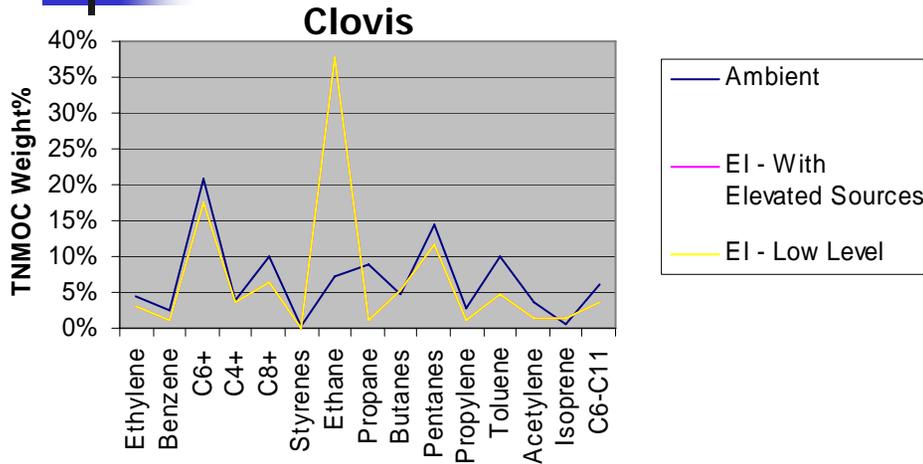

Fingerprint Comparisons (1 of 5)

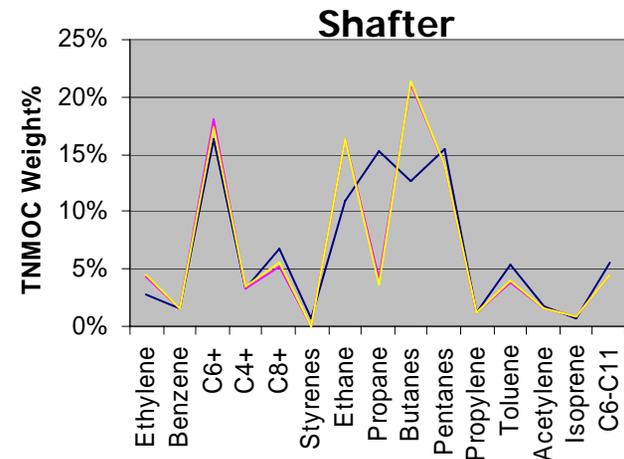

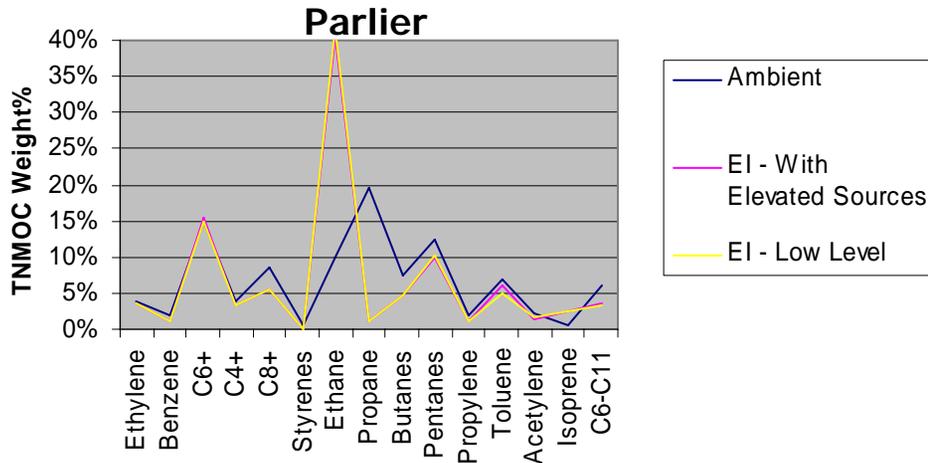

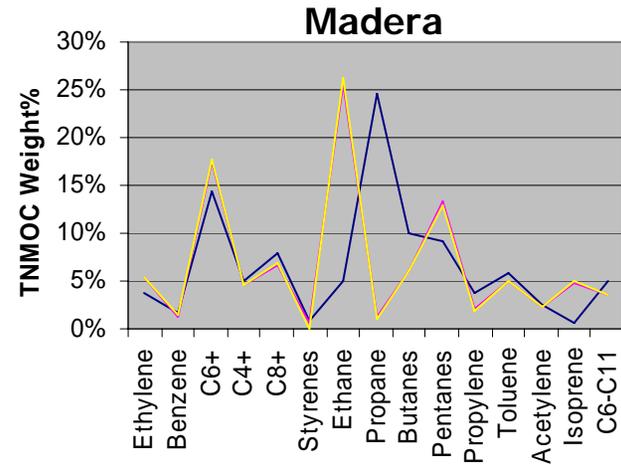

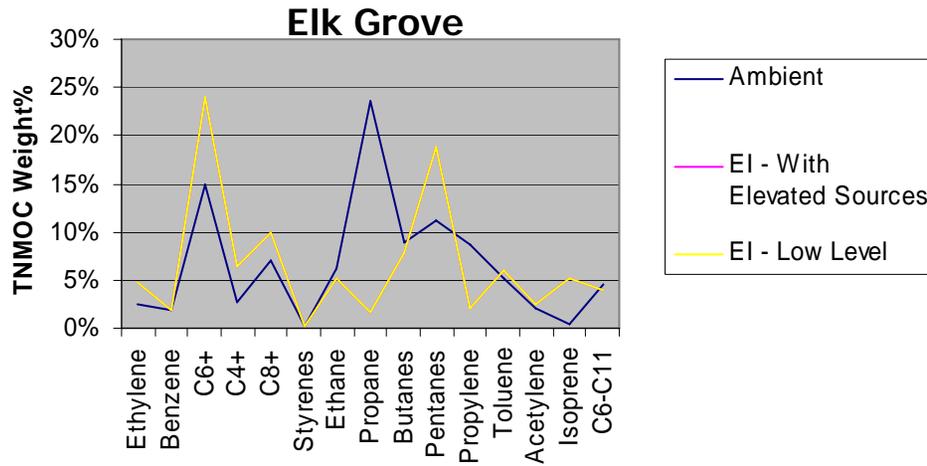

- Comparisons were performed for 10 sites
- Analyses showed:
 - Speciation of emission inventory is generally representative of the TNMOC composition detected by ambient monitoring sites
 - Ethane is consistently higher in the emission inventory
 - Propane is consistently lower in the emission inventory
 - Isoprene is consistently higher in the emission inventory

Fingerprint Comparisons (2 of 5)

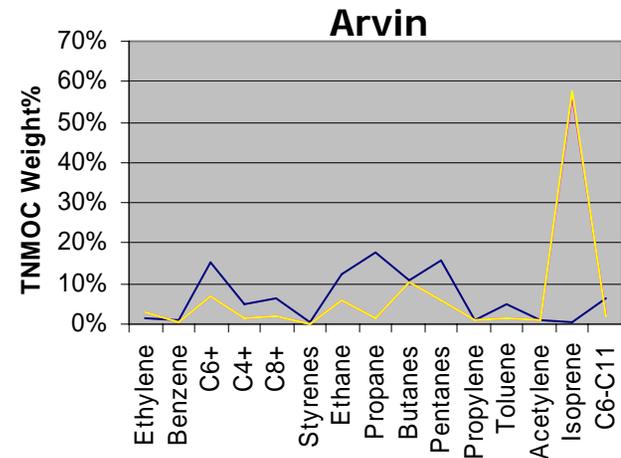

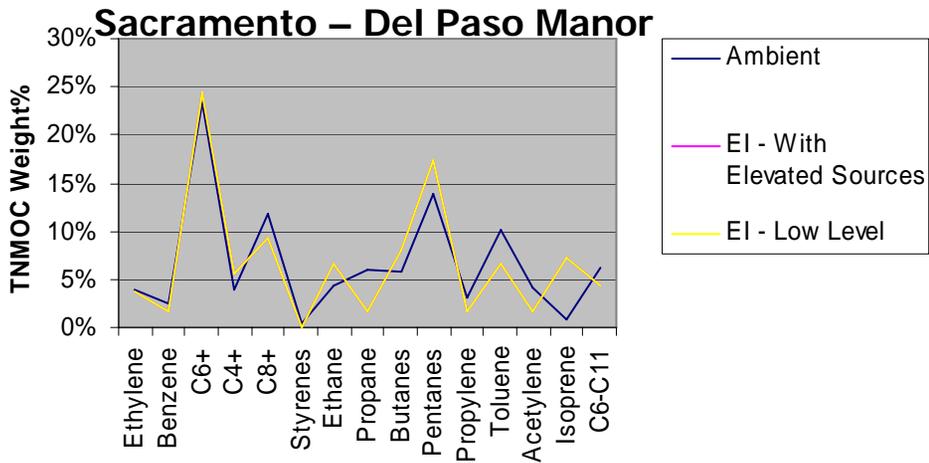

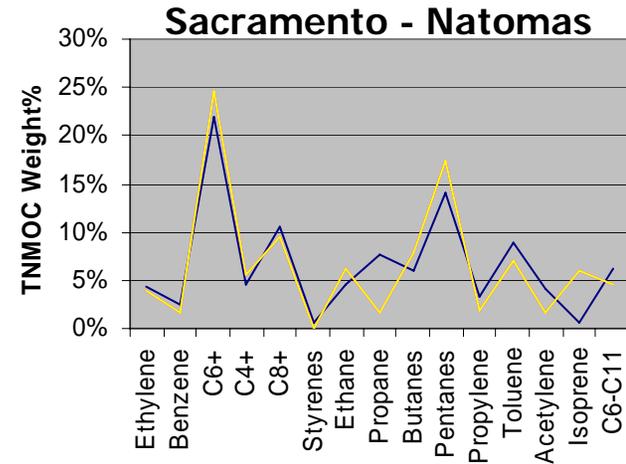

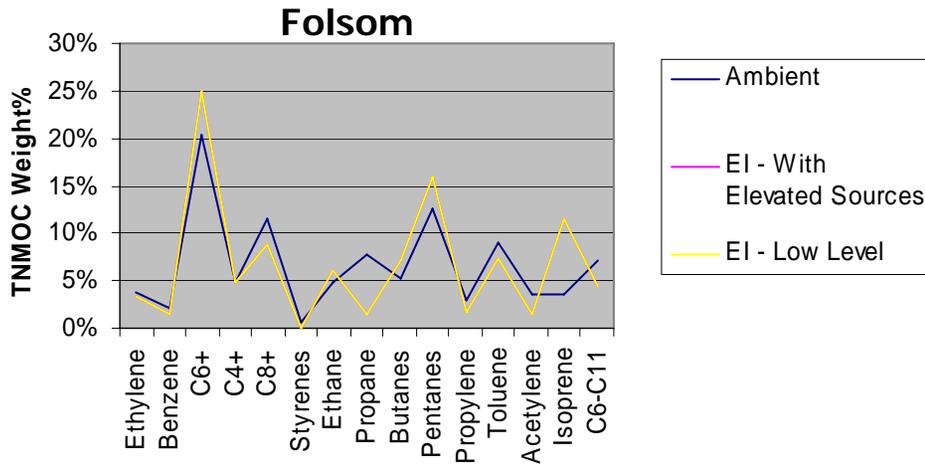

Ethane: livestock emissions spatially allocated using population density.

Fingerprint Comparisons (3 of 5)

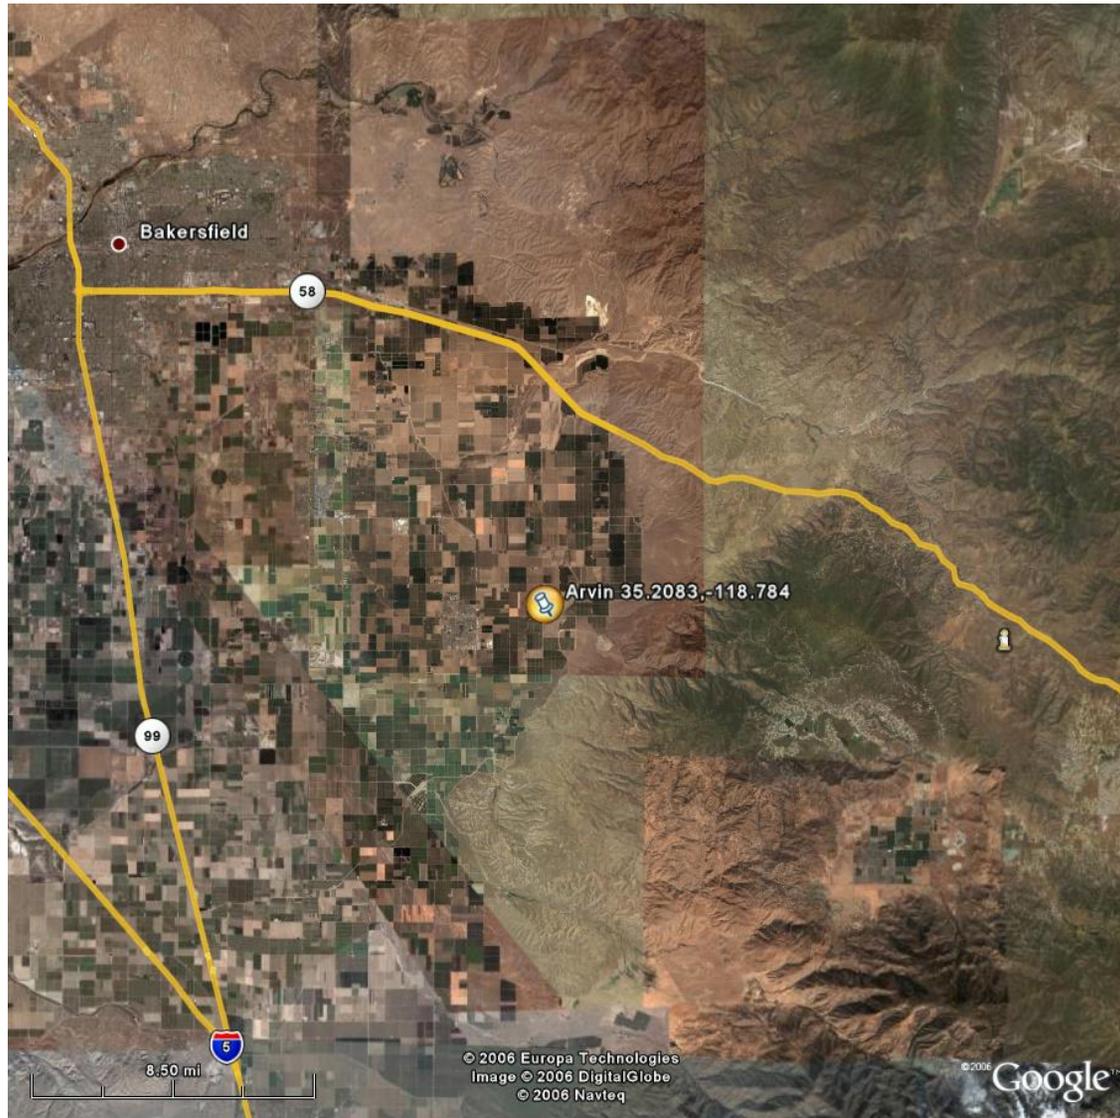

Generally Propane is associated with oil and gas extraction, except for major distribution center located at Elk Grove.

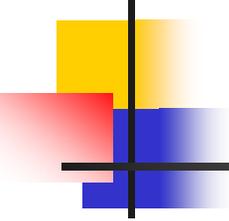

Fingerprint Comparisons (4 of 5)

Isoprene: reactivity issues; possible overestimated biogenics at Arvin.

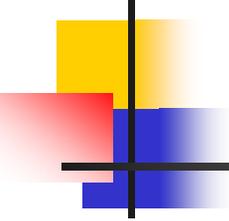

Fingerprint Comparisons (5 of 5)

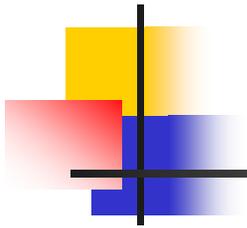

Overall Findings

- Overall, the emissions data show better agreement with ambient data than previous emission inventories have.
- At some sites, the emissions data correlate with ambient data as closely as could be expected given analyses limitations.
- EI generally under-predicts pollutant ratios
- The EI validation techniques used in this project identified specific issues with the magnitude and spatial/temporal allocation of emissions.

Sample Results

- Urbanized Sacramento area:
 - Good agreement on weekdays
 - Poorer agreement on weekends
- Urbanized Fresno area:
 - Good agreement on weekdays and weekends
- Urbanized Bakersfield:
 - Poor agreement on weekdays and weekends

Questions and Discussion
